# AUTHOR INDEX

The Author Index is intended to be a name index only and not a person index. "Adams, P" will be listed separately from "Adams, Paul" even though the names may refer to the same person, however, two listings for "Adams, P." may refer to two different authors. All authors are listed, not just primary authors.

# P PA PAS PASA PASAR

is an innovative service designed to benefit the individual users of psychology-related information. It provides a comprehensive literature search capability at a level of complexity achievable only through automated retrieval techniques. The intellectual burden for conducting an effective search is shared by the requester and APA information specialists who formulate specific retrieval strategies, augmenting vocabulary and other search parameters supplied by the requester. Experience has provided APA information specialists with the skills to efficiently interact with the automated data base which contains records published in **PSYCHOLOGICAL ABSTRACTS** from 1967 through the present.

Charges for processing **PASAR** requests are based on the amount of computer time required to perform a search. Typically these charges range from \$40 to \$60 and will not exceed \$100 unless the requester is contacted first. The total charge for a search is based on its complexity and is in most cases unrelated to the number of references retrieved. For example, a complex search strategy involving many variables or limiting factors may require more computer time and may result in fewer references retrieved than a broad search with few limiting factors.

## PASAR Search Request Guidelines

The **PASAR** Request Form has been designed to assist you in constructing a comprehensive statement of your requirements. However, it should not restrict your input. Provide whatever other information you feel will augment the information specialist's understanding of your requirements. These guidelines should help to clarify items on the Request Form.

**ITEM 1. Narrative statement of search topic.** Provide a detailed description of the subject matter you wish to be retrieved. Please avoid submitting multiple, discrete requests on a single **PASAR** Request Form, since such cannot be processed for a single fee. However, multiple aspects of a primary subject may be requested. The distinction is illustrated in the following examples:

*Acceptable:* "the effects of socioeconomic status, education level, or birth order on career motivation in women."

"Career motivation" is the primary element of this request, while the other elements serve merely to qualify or narrow the scope of this rather broad subject area.

*Unacceptable:* "the measurement of employee attitudes concerning wages and benefits. Also desire references dealing with the factors that influence management decision-making with respect to personnel policies and procedures."

Although these two topics are closely related to the design and administration of personnel policies and procedures, two separate search strategies would have to be executed to retrieve the specific information requested, and a separate charge for each would have to be made.

**ITEM 2. Descriptor(s) relevant to dependent variable(s).** Provide a list of words or phrases that indicate the subject matter of prime interest. Descriptors for the "acceptable" example (see Item #1) might include: career motivation, career preference, and career aspirations.

**ITEM 3. Descriptor(s) relevant to independent variable(s).** Provide a list of words or phrases that will qualify or narrow the scope of the dependent variable. Descriptors for the "acceptable" example (see Item #1) might include: socioeconomic status, social class, educational level, birth order, and women.

**ITEM 4. Search qualifications.** Once the subject matter of the search has been defined, you may wish to refine it with specific requirements such as population or time frame. These qualifications are often essential to the actual information need; however, they can unnecessarily limit the search, causing retrieval of few of the relevant records. Therefore, consider your requirements carefully.

**ITEM 5. Sorting requirements.** Please indicate whether you would prefer to have references sorted alphabetically by author or chronologically by year.

**ITEM 6. Intended use of search results.** Provide a description of how the references resulting from your search will be used (e.g., definition of a research project, preparation of an article, proposal preparation, dissertation, etc.).

**Ordering information:** When ordering a **PASAR** search, please read the above guidelines carefully before completing the request form. A purchase order must accompany all institutional requests for a **PASAR** search. For individuals requesting a **PASAR** search, the signature of the person responsible for payment must appear on the **PASAR** request form.

## KEY TO THE TEXT

The examples of different types of *Psychological Abstracts* records presented here are number coded to provide definition of their elements.

### JOURNAL ARTICLE ABSTRACT

<sup>1</sup> 8327. <sup>2</sup> Howard, R. Lee.; Glendenning, Robert L. & Meyer, Donald R. <sup>3</sup> (Ohio State U) <sup>4</sup> Motivational control of retrograde amnesia: Further explorations and effects. <sup>5</sup> *Journal of Comparative & Physiological Psychology*, 1974 (Feb). Vol. 86(2), 187-192. <sup>6</sup> Reports 5 investigations of variables related to the motivational control of retrograde amnesia for long-term habits, which result from single electroconvulsive shock treatments. Ss were 176 Long-Evans rats. In terms of the paradigms of M.J. Robbins and D.R. Meyer<sup>7</sup> (see PA Vol 44:11961), habits that were 3rd in a series were generally resistant to the treatment and were markedly impaired if the tests for retention were carried out in changed motivational contexts. The latter result is discussed in relation to the view that long-term habits are affected by the treatments if and only if, they operate as punishments. (<sup>8</sup>) <sup>9</sup> (15 ref) <sup>10</sup> *Journal abstract*.

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Affiliation of first-named author/editor only.
- 4 - Article title, including subtitles: If the original article is in a foreign language, the translated title is given in brackets and the language of the original article is indicated in parentheses.
- 5 - Primary publication title and bibliographic data.
- 6 - Text of abstract.
- 7 - Reference to a previous entry in *Psychological Abstracts*. If an abstract number is unavailable at time of publication, the issue number is given. Consult the Author Index of the PA issue noted in order to determine the record number for the article.
- 8 - Summaries included in the primary publication are listed when in language(s) other than that of the article.
- 9 - Number of references is included when there are 15 or more listed.
- 10 - Abstract source.

### BOOK ANNOTATION

<sup>1</sup> 8328. <sup>2</sup> Chase, William G. <sup>3</sup> (Ed). <sup>4</sup> (Carnegie-Mellon U) <sup>5</sup> *Visual information processing*. New York, NY; <sup>6</sup> Academic, <sup>7</sup> 1973. <sup>8</sup> xiv, <sup>9</sup> 555 p. <sup>10</sup> \$17.50. <sup>11</sup> Presents a series of readings on visual processes in cognition and linguistic comprehension and on information-processing models.

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Designation of editor.
- 4 - Affiliation of first-named author/editor only.
- 5 - Book title: If the book is in a foreign language, the original title is given followed by a translated title and the language of the book is indicated in parentheses.
- 6 - Place of publication.
- 7 - Publisher.
- 8 - Year of publication.
- 9 - Prepagination.
- 10 - Total pagination.
- 11 - Price.
- 12 - Text of annotation.

### BOOK CHAPTER CITATION

<sup>1</sup> 8329. <sup>2</sup> Clark, Herbert H.; Carpenter, Patricia A. & Just, Marcel A. <sup>3</sup> (Stanford U) <sup>4</sup> On the meeting of semantics and perception. <sup>5</sup> In W.G. Chase (Ed), *Visual information processing*. New York, NY: Academic, 1973. xiv, 555 p. \$17.50.

- 1 - Record number.
- 2 - Author(s) of cited chapter. As many as four are listed, if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Affiliation of first-named author only.
- 4 - Chapter title.
- 5 - Referral to the whole book and its bibliographic data.

## CONTENT CLASSIFICATION

PA has subsections for some of the 17 major classification categories. These are displayed in the Table of Contents and are designed to group all abstracts relevant to a narrower topic than the major categories under a single heading. Abstracts that are relevant to a major category but not to any of the subsections are listed first and followed by abstracts that are relevant both to a major category and also to the subsections. It is expected that this will help readers locate material related to their interests more quickly.

### ABBREVIATIONS

In addition to commonly understood abbreviations\* (including all units of measurement, educational degrees, standard statistical abbreviations, and standard Latin and reference terms), standard abbreviations used in *Psychological Abstracts* records are:

ACTH	= adrenocorticotrophic hormone	NREM	= nonrapid eye movement
DNA	= deoxyribonucleic acid	REM	= rapid eye movement
E	= experimenter	RNA	= ribonucleic acid
EEG	= electroencephalogram or -graph	S	= subject
ESP	= extrasensory perception	TV	= television
Exp	= experiment	US	= United States
IQ	= intelligence quotient	USSR	= Union of Soviet Socialist Republics
LSD	= lysergic acid diethylamide	WAIS	= Wechsler Adult Intelligence Scale
MMPI	= Minnesota Multiphasic Personality Inventory	WISC	= Wechsler Intelligence Scale for Children

Computer languages and computer names will also be used without definition, e.g., ALGOL, COBOL, FORTRAN, IBM 360.

Language abbreviations used after translated titles are:

Afri	= Afrikaans	Geor	= Georgian	Port	= Portuguese
Alba	= Albanian	Germ	= German	Romn	= Romanian
Arab	= Arabic	Grek	= Greek	Russ	= Russian
Bulg	= Bulgarian	Hebr	= Hebrew	Slov	= Slovene
Chin	= Chinese	Hung	= Hungarian	Slov	= Slovak
Czec	= Czech	Iran	= Iranian	Span	= Spanish
Dan	= Danish	Ital	= Italian	Srcr	= Serbo-Croatian
Duth	= Dutch	Japn	= Japanese	Swed	= Swedish
Finn	= Finnish	Lith	= Lithuanian	Turk	= Turkish
Flem	= Flemish	Norg	= Norwegian	Ukrn	= Ukrainian
Fren	= French	Polh	= Polish	Yugo	= Yugoslavian

# PSYCHOLOGICAL ABSTRACTS

Volume 53

May 1975

Number 5

## GENERAL

8526. Abplanalp, Paul & Hanners, Richard. (Pennsylvania State U) A stereotaxic adapter compatible with auditory evoked potential. *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 578.—Describes 2 simple adaptors which modify the Kopf stereotaxic instrument through specially designed hollow or nonrupture ear bars. These bars alleviate total occlusion of the ear canal and rupture of the tympanum, respectively, which sometimes hamper the recording of auditory evoked potentials in acute, chronic, or freely moving preparations.

8527. Andreeva, G. M. (Moscow State U, USSR) [Methodological problems in the contemporary development of American social psychology.] (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 124-131.—Discusses criticism and dissatisfaction expressed by American and European social psychologists concerning the present state of social psychology in the US, specifically in relation to its status among the sciences, the fate of the social-psychological experiment, and the effectiveness of social-psychological research. (29 ref)

8528. Arcaya, Jose. Two languages of man. *Journal of Phenomenological Psychology*, 1973(Fal), Vol 4(1), 315-329.—Contrasts theories of language developed by analytic philosophy and by phenomenology. Linguistic analysis and logical positivism are based on correspondence theories of truth and insist on independent criteria for the verification of meanings. These strict interpretations of the nature of language lead analytic philosophy to regard linguistic phenomena such as metaphor, poetry, and equivocal expressions as insignificant or inferior forms of language. Phenomenology interprets truth as the totality of man's relations with the world and frees the study of ordinary language from artificial categories. It is suggested that modern philosophy treats analytic-operational language and poetic-metaphorical language as 2 separate systems and that disciplines like psychology, history, and medicine represent indeterminate areas which draw from both types of language.—J. Kelly.

8529. Bandura, Albert. (Stanford U) Behavior theory and the models of man. *American Psychologist*, 1974(Dec), Vol 29(12), 859-869.—Explores several interpretations of behavior theory and traces the evolution of psychological thought from simple external reinforcement to a current concept of reciprocal interaction of external circumstances with personal determinants. Learning by observing and evaluating the actions of others, informed reinforcement where the S is aware of the desired outcome, the extent to which restraints of conscience are operative, and recent developments in the

analyses of memory and cognition also are discussed. Growing public concern over manipulation and control by psychological methods, and the possible misuse of improved means of influence, frequently articulated by popular writers and by theorists themselves, is refuted by the empirical facts of human behavior. (17 ref)—A. de la Haba.

8530. Bart, William M. & Wiener, Willa K. (U Minnesota) Transformational closure for the concept clock. *Journal of Structural Learning*, 1972, Vol 3(3), 99-107.—Studied the transformations under which the concept "clock" survives. 20 undergraduates were asked whether the clock remained a clock with various parts removed (transformations). Some parts were necessary for the survival of the concept and when they were removed (when relevant transformations took place) a clock no longer existed. After other removals (irrelevant transformations) the clock remained a clock. The implications of these results are discussed in terms of the idea that the concepts used by people can be examined and articulated in terms of the algebraic properties of their corresponding irrelevant transformation sets.—R. S. Albin.

8531. Bass, Bernard M. (U Rochester) The substance and the shadow. *American Psychologist*, 1974(Dec), Vol 29(12), 870-886.—Discusses the relationship between advancing technology (the substance) and good scientific theory (the shadow) in industrial/organizational psychology. Solutions presented for bridging the gap between social science and social technology include utilization of a teamwork approach to understanding problems of human abilities, motivations, and interpersonal behavior. Avoiding being prematurely "locked into" a concept before all alternatives are considered, and the incorporation of real-world data into controlled experimental settings, are advocated. Other methods include construction of models and theories that can be revised and updated as new data are supplied, and the strengthening of informational links between the 2 disciplines. (74 ref)—A. de la Haba.

8532. Brisson, Guy R. et al. (U Québec, Ctr de Recherches des Sciences de la Santé, Trois Rivières, Canada) Training effect in the design of a longitudinal study. *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 693-694.—Studied possible effects of familiarization (training effect) in the interpretation of data collected repeatedly on children during a longitudinal study on child growth. Data show that work capacity tests were occasionally subjected to interferences from familiarization. It is concluded that a proper interpretation of repeated measurements must take into account possible biases originating from training effect.

8533. Cheney, Carl & Snyder, Ron L. (Utah State U, Inst of Animal Behavior) **A chamber for separating visual and physical prey access from predators.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 553-555.—Describes a chamber suitable for medium-sized predators, such as foxes and coyotes, which provides automated separation of various phases of depredation dynamics. 2 solenoid actuated doors control visual and physical access to prey items, and a lever operandum is programable to require differential response outputs by the predator.
8534. Cherry, Christopher & Eleftheriou, Basil E. (Jackson Lab, Bar Harbor, ME) **An ejectable electrode in a syringe holder for lesioning mice.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 543-544.—Describes a holder for long, fine electrodes which is easily constructed from a disposable syringe by simply adapting the plunger for grasping the electrode and for connecting to a lesion maker.
8535. Combs, Arthur W. (U Florida) **Why the humanistic movement needs a perceptual psychology.** *Journal of the Association for the Study of Perception*, 1974(Fal), Vol 9(2), 1-13.—Specifies 7 criteria which a system must satisfy in order to be capable of unifying humanistic psychology and giving direction to its research. The criteria are explained, the adequacy of a perceptual psychology dealing phenomenologically with the personal meanings of events is considered for each of the 7 criteria, and some implications are derived. It is concluded that the specified criteria are, in fact, satisfied by the perceptual psychology in question. Several possible objections to this conclusion are answered.—B. Lindsey.
8536. Corcoran, Paul E. (U Adelaide, South Australia) **COCOA: A FORTRAN program for concordance and word-count processing of natural language texts.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 566.
8537. Crosa, Giuseppe. (Sezione Psicosomatica della Casa di Cura Psichiatrica, Genoa, Italy) **[The concept of para-psychosomatics.]** (Ital) *Medicina Psicosomatica*, 1972(Jul), Vol 17(3), 223-227.—Formulates the hypothesis that types of energy may exist other than those considered today by science. These would account for both pathogenic and healing dynamics of psychic and somatic syndromes. Beyond psychology today lies parapsychology; similarly, perhaps behind psychosomatics lies the field of parapsychosomatics, awaiting study. (English & French summaries)—D. Araoz.
8538. Dambrot, F. & Reighard, E. M. (U Akron) **Behavioral research via closed circuit television.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 779-783.—Reviews 4 studies which used closed circuit television as a part of the experimental methodology to illustrate the application of TV to behavioral research. The main advantage of TV in data collection in comparison with the "live" experiment or the use of test booklets appears to be the opportunity for a greater standardization of procedures and conditions especially when using a human E. Economic advantages are also cited.—L. Gorsey.
8539. de Wolf, Michel. (Ctr de Psychologie Différentielle et Clinique, Kessel-Lo, Belgium) **[The "birth trauma" of Otto Rank: Freud's first reactions to a dissidence symptom.]** (Fren) *Revue de Psychologie et des Sciences de l'Education*, 1974, Vol 9(2), 131-161.—Discusses the work of O. Rank in terms of the same principle that guided Freud in his examination of the dissensions between Jung and Adler. Rank's theoretical dissent takes the form of a psychical symptom, insofar as it becomes a system whose deep function is to prevent the anxious return of what has been repressed.
8540. Dooling, Robert J. & Walsh, James K. (St Louis U) **A technique for EEG recording in the awake parakeet.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 545-546.
8541. Eibl-Eibesfeldt, Irenäus. **Love and hate: The natural history of behavior patterns.** (Trans G. Strachan). New York, NY: Schocken, 1974. 276 p. \$4.50.—Traces the development of behavior patterns (e.g., weapon making, child rearing, and hand shaking) among the higher vertebrates and man to demonstrate that many such patterns are part of a genetic inheritance. Also discussed are phylogeny and ritualization, the biological basis for ethical norms, and the development of the personal bond and basic trust. (224 ref)
8542. Fahrmeier, Edward D. (U Maryland, Baltimore County) **The validity of the transactionalist's assumed world: A critical reinterpretation of an experiment in size constancy.** *Journal of Phenomenological Psychology*, 1973(Fal), Vol 4(1), 261-270.—Examines transactionalist size constancy experiments from the viewpoint of M. Merleau-Ponty's concepts of perception. The transactionalist interpretation of errors in distance perception is based on an illusory assumed world of experiences and memories adhering to present perceptions. Merleau-Ponty rejects the notion of an assumed world and instead regards perception as an immediate interaction between the living body in space and its surroundings. It is suggested that the perceptual errors which occurred in transactionalist size constancy experiments were a result of artificial constraints placed by the experimental situation on the natural perceptual abilities of the Ss.—J. Kelly.
8543. Fischer, William F. **On the phenomenological mode of researching "being anxious."** *Journal of Phenomenological Psychology*, 1974(Spr), Vol 4(2), 405-423.—Discusses the presuppositions of the phenomenological approach to psychological research, and describes various modes of being anxious and of experiencing the anxiety of others discovered during the research.
8544. Giurgea, Corneliu. (U Louvain, Brussels, Belgium) **The creative world of P. S. Kupalov.** *Pavlovian Journal of Biological Science*, 1974(Oct-Dec), Vol 9(4), 192-207.—Offers a eulogy of P. S. Kupalov, a former student of I. Pavlov's. Kupalov's contributions to the classical Pavlovian views of higher nervous activity are considered, and his own concepts and research interests are described. (35 ref)
8545. Gocka, Edward F.; Rostami, Hojat J. & Grossman, Loren R. (VA Hosp, Predictive & Evaluative Models Research Lab, Sepulveda, CA) **Subroutine for multiple logistic discriminant function analysis.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 568.

8546. Hannush, Mufid J. (Duquesne U) **Adorno and Sartre: A convergence of two methodological approaches.** *Journal of Phenomenological Psychology*, 1973(Fal), Vol 4(1), 297-313.—Explores the underlying reasons for similarity in the findings of T. W. Adorno and J. P. Sartre. Phenomenological psychology attempts to explain concrete experiential examples of behavior (e.g., anti-Semitism) in terms of man's interactions with his world. It is suggested that Adorno and Sartre arrived at similar conclusions in their investigations because they both were guided by everyday experiences, observations, and common-sense information, and because both studied the authoritarian personality as a comprehensive phenomenon. It is concluded that Adorno's primary achievement was a basically phenomenological analysis of authoritarianism as a total trend of consciousness and that his quantitative investigations were relatively unimportant.—J. Kelly.

8547. Horkheimer, Max. **Critique of instrumental reason: Lectures and essays since the end of World War II.** (Trans M. J. O'Connell et al). New York, NY: Seabury Press, 1974. x, 163 p. \$7.95.—Presents a collection of 9 essays, written between 1949 and 1967, on the 20th century phenomenon of the state-bureaucratic apparatus, the triumph of "instrumental reason," and the dissolution of the basic social institutions and relationships associated with the concept of the individual.

8548. Kent, Ronald N.; O'Leary, K. Daniel; Diamant, Charles & Dietz, Allen. (State U New York, Stony Brook) **Expectation biases in observational evaluation of therapeutic change.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 774-780.—Investigated systematic biases of observational recordings of behavior as a function of experimental hypotheses. Predictions of decrease and of no change in level of recorded behavior as a function of "treatment" were given, respectively, to 2 groups of 5 pairs of Os (high school students). Both groups viewed the same videotapes, selected to show no change from "baseline" to "treatment." Global evaluations of treatment effects were significantly affected by predicted results, but behavioral recordings were not. Observational recordings were increased by knowledge by Os that reliability was being assessed, computation of reliability within (vs between) O pairs, and computation of reliability by the Os (vs the E). (25 ref)—*Journal abstract*.

8549. King, Nancy W.; Hunt, Edward L.; Castro, Richard D. & Phillips, Richard D. (Pacific Northwest Lab, Richland, WA) **An automated swim alley for small animals: I. Instrumentation.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 531-534.—Describes a technique for testing the long-term performance capacity of rats, in which Ss swim back and forth in an alley, in temperature-controlled water, between platforms that are alternately and automatically raised and lowered. Continuous measurement is made of speed of movement between platforms. (19 ref)

8550. King, Nancy W.; Hunt, Edward L.; Castro, Richard D. & Phillips, Richard D. (Pacific Northwest Lab, Richland, WA) **An automated swim alley for small animals: II. Training and procedures.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 535-540.—Conducted experiments to establish condi-

tions that produce uniform and reliable swimming performance of rats in a swim alley described previously by the authors (see PA, Vol 53:Issue 5). In this system, rats swam intermittently for as long as 24 hrs for a distance of more than 7 km.

8551. Klein, Barry T. (Ed.). **Reference encyclopedia of American psychology and psychiatry.** (1st ed). Rye, NY: Todd, 1975. iv, 459 p.—Presents alphabetical and geographical listings of associations and societies, research centers, periodicals, foundations, audiovisual aids, psychiatric hospitals, graduate schools and training programs, and organizations related to the major subject-categories in the fields of psychology and psychiatry.

8552. Lambert, Robert H.; Monty, Richard A. & Hall, Robert J. (US Army Human Engineering Lab, Aberdeen Proving Ground, MD) **High-speed data processing and unobtrusive monitoring of eye movements.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 525-530.—Describes a system which monitors eye movements without imposing any unnatural constraints or mechanical attachments on the S. The system features high-speed on-line data processing.

8553. Lansley, Peter R. & Webb, Terry D. (Ashridge Management Research Unit, Berkhamsted, England) **ORGAN and ORGY: Programs for the analysis of organization structures.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 567-568.

8554. León, Verna A. (U Peruana Cayetano Heredia, Lima, Peru) **[Child psychiatry in Peru: A historical review.]** (Span) *Revista de Neuro-psiquiatria*, 1973(Sep), Vol 36(3), 169-184.—Traces historical developments of child psychiatric care in Peru, beginning with the 1920s. The main events in this process and their meaning and relationship to Peruvian professionals and institutions are examined by decades. (French & German summaries) (46 ref)

8555. Lewis, Robert T. & Petersen, Hugh M. (California State U, Los Angeles) **Human behavior: An introduction to psychology.** New York, NY: Ronald Press, 1974. vii, 459 p. \$6.50.—Presents an introductory text on psychology as both a social and a biological science. Topics include psychology's relation to philosophy, education, religion, business, physiology, and medicine, and the nature of psychological theory and measurement. A programmed student guide is also included (see PA, Vol 53:Issue 5). (4 p ref)

8556. Lewis, Robert T. & Petersen, Hugh M. (California State U, Los Angeles) **Human behavior: An introduction to psychology: Student guide.** New York, NY: Ronald Press, 1974. v, 111 p. \$1.95.—Presents a programmed guide on psychological concepts which accompanies the authors' text *Human Behavior: An Introduction to Psychology* (see PA, Vol 53:Issue 5).

8557. Martens, Francis. **[Echoing the uncanny.]** (Fren) *Revue de Psychologie et des Sciences de l'Education*, 1974, Vol 9(2), 203-208.—Proposes that the conclusions which Freud draws in his article "The Uncanny" ("Das Unheimlich," 1919) considerably understate the implications developed in the rest of the article. His analysis classically adopts the concepts of castration, repression, anxiety, and repetition. This level of explanation weakens the very examples he chose to illustrate his analysis,

particularly the use made of the specifically visual order implied by the double and vision in Hoffman's tale "The Sandman". That tale offers a remarkable presentation of the "mirror world" (as it is formulated by Lacan in "The Stage of the Mirror"). In Freud—who was concerned with history rather than with structure—the double is hardly seen; it is merely the messenger from a disquieting past. The space of identification is replaced by the history of identification. The perturbing nature of the double stems not so much from the danger in the repressed elements which it contains as from its mode of intervention—which is to upset the spatial order of things, thus menacing the limits of the individual body and the fragile conquest of identity. Viewed from this angle, "the uncanny" arises from the always imminent threat of chaos—the disappearance of boundaries, the abolition of limits—and displays the precarious basis of the symbolic order. (English summary)—*S. S. Marzolf.*

8558. **Martindale, Colin.** (U Maine, Orono) **LEXSTAT: A PL/I program for computation of lexical statistics.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 571.

8559. **McVaugh, Michael R. & Mauskopf, Seymour H.** (U North Carolina, Chapel Hill) **Historical perspective and parapsychology.** *Journal of Parapsychology*, 1974(Sep), Vol 38(3), 312-323.—Discusses the work of 2 science historians whose investigations of the history of parapsychology focus on the field as an integral part of the general scientific culture of its period. Particular emphasis is placed on the background of J. Rhine in an attempt to determine the continuity of his work with early attempts at experimentation, the discontinuities and how they arose, and how his work was received. Specific examples of differences in perspectives among parapsychologists are provided.—*Journal abstract.*

8560. **Mecacci, Luciano.** (Consiglio Nazionale delle Ricerche, Istituto di Psicologia, Rome, Italy) **Western literature on Soviet psychology and physiology of behavior: A selected bibliography.** *Pavlovian Journal of Biological Science*, 1974(Oct-Dec), Vol 9(4), 233-245.—Lists over 260 entries, including writings which have appeared in Western countries about Soviet psychology, and the translations into English, French, German, Spanish, and Italian of monographs and anthologies by Soviet psychologists.—*Journal abstract.*

8561. **Moise, Samuel L.; Olsen, David E. & Huston, Steve W.** (U California, Brain Research Inst, Space Biology Lab, Los Angeles) **An automated system for prime instruction for behavioral neurophysiology.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 557-564.—Describes a flexible hardware-software system developed for use with a PDP-81 computer for conducting research in behavioral neurophysiology. A real-time monitor facilitates development, debugging, and modification of programs to run experiments. The system relieves the programmer of the burden of dealing with hardware-dependent functions such as interrupt handling and input-output. In addition, it provides the user with a large library of callable routines to perform functions commonly needed for conducting experiments.—*Journal abstract.*

8562. **Nikolskaya, A. A.** (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General &

Pedagogical Psychology, Moscow) **[On the psychological views of P. P. Blonskii.]** (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 3-20.—Discusses P. P. Blonskii's (1884-1941) views on psychological problems. Blonskii was instrumental in shaping and developing Soviet psychology and had a wide range of psychological interests. Among the aspects of his thought that are considered are his views on the scientific method in psychological research, on the developmental aspect of behavior, and on the holistic approach to the study of man; his attempts to work out the interrelationships among the various aspects and levels of mental activity and between mental and physical processes, the effect of behavior on mental development, and the principles governing mental development. (English summary) (39 ref)—*L. Zusne.*

8563. **Ohtani, Akira; Kuchinomachi, Yasuo & Yagi, Akihiro.** (Industrial Products Research Inst, Tokyo, Japan) **A simple device for detecting saccades and judging their intervals.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 547-549.—Describes an apparatus with which the occurrence of saccades can be detected and their intervals classified by reference intervals determined by experimental requirements. The device reliably detects saccades of greater than 2°.

8564. **Parsons, Arthur S.** (Smith Coll) **Constitutive phenomenology: Schutz's theory of the We-relation.** *Journal of Phenomenological Psychology*, 1973(Fal), Vol 4(1), 331-361.—Discusses the impact of A. Schutz's theory of the We-relation on his analysis of the constitution of a world of intersubjective meaning. Schutz holds that individuals are capable of We-relations in which the self is experienced through interaction with another person and by which an intersubjective world is mutually constructed. Mundane We-relations allow cooperative participation in the routine projects of society, while transcendent We-relations reconstitute and modify the intersubjective world. It is suggested that Western societies and families maintain a dialectical balance between these 2 types of We-relations.—*J. Kelly.*

8565. **Prabhu, G. G.** (India Inst of Medical Sciences, New Delhi) **Clinical psychology in India: In retrospect & prospect.** *Indian Journal of Clinical Psychology*, 1974(Mar), Vol 1(1), 3-7.—Describes the development of clinical psychology, as an independent scientific discipline, in India. The Indian Association of Clinical Psychology (IACP), established in 1968, was the first professional body formed to deal solely with issues in the field of clinical psychology. Although the IACP has achieved moderate success in responding to these issues, it is suggested that the association can increase its effectiveness in solving the problems facing Indian society by accepting additional responsibilities, i.e., for official registration of clinical psychologists, more advanced research activities, educating the public, working with other professional groups, continued education for professionals, and evaluation and revision of training programs in terms of society's needs and scientific advances.—*F. S. Beyer.*

8566. **Ryan, Joseph B.** (Family Life Apostolate of the Archdiocese of Newark, NJ) **Sixteenth century Skinner.** *Clinical Social Work Journal*, 1974(Sum), Vol 2(2),

105-112.—Presents similarities between a 16th century theological debate of Thomists vs Molinists, and the works of B. F. Skinner vs R. May and C. Rogers.

8567. Schandler, Steven L. & Grings, William W. (U Southern California) **A system for providing tactile EMG biofeedback.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 541-542.—Describes an inexpensive system for providing discrete pulses against the skin surface at a frequency proportional to the level of activity from selected muscle groups. System capabilities include the production of digital information for recording devices and the providing of pulsed auditory electromyogram biofeedback. The system may be particularly applicable for the experimental reduction of psychological and muscle tension.

8568. Smith, F. J. **Musical sound as a model for Husserlian intuition and time-consciousness.** *Journal of Phenomenological Psychology*, 1973(Fal), Vol 4(1), 271-296.—Discusses the relationships between the experience of music and E. Husserl's phenomenological theories of perception. It is suggested that traditional musicology has overemphasized the mathematical and cognitive aspects of musical structure and underemphasized the study of sound perception. Musical metaphors and analogies were frequently used by Husserl to illustrate the psychological processes of intuition and time-consciousness. It is concluded that the attempts of 20th century musicology to explain auditory perception can benefit from both psychological empiricism and phenomenology.—J. Kelly.

8569. Sterner, Ray T.; Rawson, Ricky L. & Schulz, John W. (Denver Wildlife Research Ctr, Section of Supporting Sciences, CO) **Single-channel data sampling: Note on fabrication of an inexpensive, periodic scanner.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 743-746.—Observed classic sinusoidal circadian temperature patterns for 7 albino rats maintained under standard laboratory conditions using an inexpensive periodic scanner. Data validate use of both the device and the sequential sampling approach in certain biological-behavioral research applications.

8570. Sterner, Ray T.; Wheeler, James T. & Krabill, Lavern F. (Letterman Army Inst of Research, San Francisco, CA) **POSTHOC: A FORTRAN IV program for computing one-way analysis of variance and post hoc Dunnett, Newman-Keuls, or Scheffé mean comparisons.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 569.

8571. Thompson, Glenn C.; Heffner, Henry E. & Masterton, Bruce. (Florida State U) **An automated sound-localization chamber.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 550-552.—Describes a free-field apparatus and a behavioral technique with which the ability to localize the source of a sound has been successfully tested in a wide variety of mammals including cats, rats, squirrel monkeys, hedgehogs, and tree shrews.

8572. Tomlinson, Wallace K. & Perret, J. John. (Tulane U, Medical School) **Mesmerism in New Orleans, 1845-1861.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1402-1404.—Mesmerism was generally rejected by the medical establishment in Europe and the United States until J. M. Martin Charcot introduced it at

the Salpêtrière in the 1870s. Nonetheless, a well-organized and active mesmer society flourished in New Orleans from 1845 to 1861. The origins of the society, composition of the membership, its activities, and its relationship with the established medical community are presented. (18 ref)—*Journal abstract*.

8573. Toremalm, N. G. & Lagerholm, S. (U Lund, General Hosp, Malmö, Sweden) **The noise dosimeter.** *Scandinavian Audiology*, 1973, Vol 3(1), 3-9.—Describes a pocket-sized individual noise dosimeter which enables the user to measure the intensity, frequency, and duration of exposure to local noise sources as a prophylaxis against noise-induced hearing loss. Basic function tests of the apparatus are detailed.

8574. Urken, Arnold B. & Van der Veen-Huijsman, Antje. (Stevens Inst of Technology) **VOTEORD: A revision of VOTEPOW which includes an algorithm for analyzing sets of power orderings.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 571.

8575. Van Duyne, H. John. (Northern Illinois U) **A changing conceptualization of man in psychology.** *Journal of the Association for the Study of Perception*, 1974(Fal), Vol 9(2), 36-40.—Points out a shift from the behavioristic paradigm of observable bodily behavior to the cognitive paradigm of mental information processing which has been, since 1960, occupying scientific inquiry concerned with learning and performance. 3 recent historical developments contributing to this paradigm shift are noted. One such development has involved philosophical attacks which decreased the persuasiveness of the assumptions of British empiricism and logical positivism. Another development has consisted in exposure to psychological paradigms other than the behavioristic one, primarily those inherent in the philosophical traditions of Piaget's genetic epistemology and the materialistic monism of the USSR. The 3rd historical development has been the availability of new theoretical formulations and methodologies for dealing with cognitive processes that resulted from advances in disciplines such as finite mathematics, information theory, and linguistics. (37 ref)—B. Lindsey.

8576. Walsh, Robert R. & Roach, Eric T. (U Wisconsin, Madison) **A note on Pellegrino's (1972) program for analyzing higher order subjective organization units in free recall.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 565.

8577. Wassermann, Gerhard D. (U Newcastle upon Tyne, England) **Brains and reasoning: Brain science as a basis of applied and pure philosophy.** Hamden, CT: The Shoe String Press, 1974. xi, 169 p. \$15.—Develops the thesis that a neuropsychology-philosophy feedback cycle can be established, which by successive approximations may provide gradually improving simultaneous answers to major problems of neuropsychology and many branches of philosophy.

8578. Webb, Wilse B. (U Florida) **Progress in psychology: 1903-1907.** *American Psychologist*, 1974(Dec), Vol 29(12), 897-902.—Summarizes 5 annual reviews of psychological thought published between 1903 and 1907 by E. T. Buchner, editor of the *Psychological Bulletin*.

8579. Weinland, James D. **Consciousness, freedom, and dignity.** Philadelphia, PA: Dorrance, 1974. 99 p.

\$4.95.—Examines some of the controversy surrounding the view of consciousness as the humanizing aspect of man and behaviorism, which holds that all human actions are determined by past physical contingencies.

8580. Wicks, Jerry W. (Bowling Green State U) **Age-standardized death rates by the indirect method: A program for use on a computer terminal.** *Behavior Research Methods & Instrumentation*, 1974(Nov), Vol 6(6), 570.

8581. Wilson, Emmett. (Cornell U, Medical Coll, New York) **The structural hypothesis and psychoanalytic metatheory: An essay on psychoanalysis and contemporary philosophy of science.** *Psychoanalysis & Contemporary Science*, 1973, Vol 2, 304-328.—Presents some problems stemming from functional interpretations of psychic structures (e.g., ego, id, superego). It is suggested that psychological theorists who object to the terms of the structural hypothesis because they are abstract entities do not understand the basically analogical nature of scientific theories. (3 p ref)

8582. Winett, Richard A.; Fuchs, William L. & Moffatt, Sarah A. (U Kentucky) **Personal and impersonal methods of recruitment for social research.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 376-379.—Investigated the effectiveness of both personal and impersonal methods of recruiting families for a study on the effects of day care. The personal approach included talks to groups of parents, tests, detailed handouts, and interviews. The impersonal method consisted of newspaper stories noting that participant families would be paid \$5. Generally, both methods resulted in an adequate sample size (personal  $n = 97$ ; impersonal  $n = 107$ ) and a low dropout rate. Neither approach, however, successfully recruited lower socioeconomic status or black families. For each method ethical safeguards were taken to assure participant's full knowledge of the procedures and objectives of the project. Because the impersonal method required much less time and effort (about 40 hrs), it is suggested that researchers first use the impersonal method, followed if necessary by a focused personal approach.—*Journal summary*.

## PSYCHOMETRICS AND STATISTICS

8583. Murrell, Hywel. (U Wales, Inst of Science & Technology, Cardiff) **Performance rating as a subjective judgement.** *Applied Ergonomics*, 1974(Dec), Vol 5(4), 201-208.—Argues that there appears to be no reason for subjective judgments of rating to differ from other forms of human judgment. For a rating scale to be linear, the subjective assessment and the actual performance should both be expressed in logarithmic form. The present investigation uses data from previously published research to explore the possibilities of this concept. It is concluded that, provided proper scales are used and proper safeguards taken, subjective assessment as a method of measurement can be highly efficient.—*Journal abstract*.

8584. Osborn, William C. **Process versus product measures in performance testing.** *HumRRO Professional Paper*, 1974(Oct), No 16-74, 4 p.—Perform-

ance tests are used in training evaluation to certify student achievement and to diagnose weaknesses in the instructional system. Proficiency measures that focus on task outcomes (product) normally provide data relevant to the 1st purpose, whereas measures of how the tasks are carried out (process) pertain to the 2nd. Time or cost factors sometimes preclude the use of product measures, leaving measures of task process as the only available criteria for evaluating training outcomes. Instances in which process measures are typically substituted for product measures are described, with reference to the types of tasks for which the substitution is valid and those for which it is invalid. Theoretical and practical issues pertaining to the use and misuse of process measures are discussed.—*Journal abstract*.

8585. Phillips, Beeman N. (Ed.). **Assessing minority group children: A special issue of Journal of School Psychology.** New York, NY: Behavioral Publications, 1973. 291-413.—Includes 11 chapters which discuss psychological testing and its underlying assumptions, criterion-referenced and norm-referenced assessment of minority group children, strategies for assessing intellectual patterns in minority group children, and language characteristics of black and Mexican-American children. Some psychological materials are also reviewed.

8586. Popplestone, John A. & McPherson, Marion W. (U Akron, Archives of the History of American Psychology) **The prolonged avoidance of intellectual behavior.** *Psychological Record*, 1974(Fal), Vol 24(4), 549-557.—The 1960 Stanford-Binet Intelligence Scale demonstrates an extensive amount of historic content in that 8% of it is 63-69 yrs of age, nearly 50% is 56 yrs old, and 100% is 37 yrs of age. Such longevity is typical of various contemporary tests, and the use of aged material promotes freedom from recent research results. Items have been retained because they yield results congruent with the hypothesized constancy of "intelligence" and because they are practical, easy to administer, and score. The continued reliance on such material syntonetic with outmoded theory prolongs the avoidance of observations of intellectual behavior. (27 ref)—*Journal abstract*.

8587. Wig, N. N.; Pershad, D. & Verma, S. K. (Postgraduate Inst of Medical Education & Research, Chandigarh, India) **The use of psychometric tools in Indian psychiatric research: A reappraisal.** *Indian Journal of Clinical Psychology*, 1974(Mar), Vol 1(1), 8-14.—Describes several areas of psychometric testing in India to which future efforts must be directed. Results of the recent increase in the administration of translations and adaptations of Western tests have indicated that test validity is severely limited by culture-bound concepts and interpretations, in addition to inducing patient distress. This situation is also evidenced with the use of "culture-free" tests. Another potential source of invalidity is test difficulty. Only 4 out of 17 Hindi tests were found to have acceptable test difficulty levels. Other areas requiring attention are the suitability of statistical procedures commonly employed and the need for psychometric testing in additional areas. A recommended procedure for test construction is presented. (20 ref) —F. S. Beyer.

## Test Construction &amp; Validation

8588. Anwar Yousuf, S. F. (A.N.S. Inst of Social Studies, Patna, India) **An investigation into the construct validity of the Nationalization Scale.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 48-53. —Related scores on Mohsin's Nationalization Scale (NS) to scores on Sinha's Dependence Proneness Scale (DPS) and Rotter's Internal-External Control Scale (IECS) in a study of the construct validity of the NS. 200 18-27 yr old college students were tested. Contrary to hypothesis, the scores on DPS and IECS did not correlate significantly either with each other or with the scores on NS. Differences in the scores of Arts students and Science students, and the relationship between biographical factors and attitudes toward nationalization, are discussed.—*B. Lindsey.*

8589. Baumann, Urs. (U Zurich, Psychiatric Clinic, Switzerland) **[Examination of the equivalence of FPI results.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 2(2), 85-104.—Investigated the equivalence of data obtained from 7 different samples given the primary and derived scales of the Freiburg Personality Inventory (FPI). The numerous aspects which were studied are specified and discussed. Analysis of results of the study indicates the following: (a) Mean values are influenced significantly by age, sex, nationality, and experimental situation and can be compared only in parallel groups. (b) Covariation of variables is largely independent of the samples, and data obtained from factor analyses with FPI scales and other variables are valid. (c) Statistical models which assume linear regression are adequate with FPI scales because curvilinear regression is infrequent. (d) The derived scales E, N, and M (extraversion, emotional lability, and masculinity) are well defined by the 9 primary scales. (e) 5 of the 12 scales—FPI 1, 2, 4, 9, and N—deviate either in quantity or in direction from the normal distribution. It is suggested that a short version of the extraversion, neuroticism, and openness scales would be useful and should be considered and studied. (English summary) (15 ref)—*T. Fisher.*

8590. Brandtstädter, Jochen & Becker, Peter. (U Trier-Kaiserslautern, W Germany) **[The possibility of integrating factor-analytical and clinical research: A study of the Minnesota Multiphasic Personality Inventory.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 2(2), 105-125.—Discusses the possibility and potential research value of integrating clinical and factor-analytical findings and demonstrates related problems and methodological approaches with the Saarbrücken MMPI as an example. MMPI profiles of different clinical groups were coordinated with the factors obtained in a factor analysis of MMPI data from a sample of 281 military persons by estimating factor scores of the clinical profiles and comparing them with profiles of ideal types derived from the obtained MMPI factors. Data of the study are said to confirm the heuristic value of the integration of clinical and factor-analytical findings. (English summary) (34 ref)—*T. Fisher.*

8591. Burns, Edward & Schaaf, Sally. (Ohio U) **The validity of ITPA composite psycholinguistic age and psycholinguistic quotient scores.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 308-309.—Reports on the

validity between the Illinois Test of Psycholinguistic Abilities and the Stanford-Binet, with children 3-5 yrs old.

8592. Cherlin, Andrew & Bourque, Linda B. (U California, Los Angeles) **Dimensionality and reliability of the Rotter I-E Scale.** *Sociometry*, 1974(Dec), Vol 37(4), 565-582.—In an attempt to develop suggestions for more effective use of Rotter's Internal-External Control Scale (I-E), an analysis was made of the dimensionality and reliability of the scale in both 161 undergraduates and 100 randomly selected adults. Results imply that (a) the I-E Scale should not be considered as unidimensional, (b) the characteristics of the population sampled may affect the structure of the factors obtained and also the strength of the reliabilities of the various factor scales, and (c) other items used with the I-E Scale in the same survey instrument may affect the structure and reliability of the resultant scales. Data analysis procedures are suggested which may prove useful in studies employing other attitude measurement scales. (15 ref)—*Journal abstract.*

8593. Cohler, Bertram J.; Weiss, Justin L. & Grunebaum, Henry U. (U Chicago, Committee on Human Development) **"Short-form" content scales for the MMPI.** *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 563-572.—Using an abbreviated version of content scales derived by a rational-theoretical approach to the MMPI item pool rather than the traditional criterion group approach, this report demonstrates both satisfactory long-short-form correlations and promising internal consistency for these short-form scales. Comparing 40 women discharged from a psychiatric hospital and 41 nonpsychiatric controls, these content scales differentiated the 2 groups both at the beginning of an aftercare and intervention study and approximately 20 mo later. Mood scales were somewhat less stable over time, especially among patients. While not correlated with age or verbal intelligence, several scales were correlated with measures of social status. (21 ref)—*Journal abstract.*

8594. Curran, J. D. & Gibson, H. B. (Hatfield Polytechnic, England) **Critique of the Stanford Hypnotic Susceptibility Scale: British usage and factorial structure.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 695-704.—Criticized the Stanford Hypnotic Susceptibility Scale with regard to a number of procedural and technical details. It is suggested that it cannot be administered and scored with complete efficiency by 1 E working on his own. The administration and content of the scale were modified in a number of specified ways and 43 undergraduates were tested, E and O being present at each individual session. Results were analyzed with respect to the percentage of Ss passing each item, with item-scale correlations, interitem correlations, and factorial structure. Data suggest there is need for technical improvements in the administration of the scale and for the development of additional items which would be "purer" measures of the behaviors being measured. (21 ref)—*Journal abstract.*

8595. Duke, Marshall P. & Kiebach, Carol. (Emory U) **A brief note on the validity of the Comfortable Interpersonal Distance Scale.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 297-298.—Conducted a study of 20 Ss to test the validity of the Comfortable

Interpersonal Distance Scale (CID) by examining the relationship between CID scores and real life distancing preferences. Results support the validity of the CID.

8596. Gendre, F. [Evaluation of the personality by the California Psychological Inventory (CPI) by H. Gough.] (Fren) *Revue de Psychologie Appliquée*, 1974, Vol 24(3), 159-179.—Reports on a study of the factorial composition, reliability, and validity of the CPI. Multiple regression equations are provided for predicting academic achievement and delinquency from CPI scales. The relation of the CPI to the MMPI in a clinical setting is reported, and its application in selecting secretaries and mechanics is described.

8597. Klemmack, David L.; Carlson, John R. & Edwards, John N. (U Alabama) Measures of well-being: An empirical and critical assessment. *Journal of Health & Social Behavior*, 1974(Sep), Vol 15(3), 267-270.—An analysis of 3 commonly used measures of well being—the Life Satisfaction scale, the Social Isolation scale, and the Willingness to Live scale—shows that the internal consistency of the social isolation items does not exceed the cross-correlation between the social isolation and life satisfaction items.

8598. Larsson, Bernt. Frequency words and frequencies: A pilot study on relations between differently anchored scales. *Didaktometry*, 1974(Nov), No 44, 13 p.—Required 44 20-70 yr old adults to answer 6 questions, partly with a frequency response and partly by marking a verbally anchored scale with 5 categories. Univariate and multivariate analyses were performed to elucidate the relationships between variables resulting from the 2 different modes of response. Although there were similarities in results for the 2 types of variables they could be regarded as interchangeable. The frequency spread for a given category was often far from negligible.—*Journal abstract*.

8599. Moore, Robert J. (U Saskatchewan, Regina, Canada) Detectability of items and self-rating validation of the Eysenck Personality Inventory. *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 573-577.—Asked 31 male and 36 female 18-67 yr old Ss to identify which items of the Eysenck Personality Inventory (EPI) were measuring extraversion (E), neuroticism (N), and lying. In contradiction of previous findings employing university students, the present sample was neither cognizant of the EPI's specific objectives, nor were they capable of detecting accurately individual items with any degree of consistency. In addition, Ss were requested to rate themselves on E and N. Self-rating and EPI means and standard deviations were essentially equivalent. Correlations between self-rating and EPI measures of E and N were .57 and .41, respectively.—*Journal abstract*.

8600. Mueller, Daniel J. (Indiana U, School of Education) A test of the validity of two scales on Rokeach's Value Survey. *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 289-290.—Constructed additional scales to measure the validity of the "Equality" and "Freedom" constructs of the Rokeach Value Survey. Results show low correlations between the developed scales and the Rokeach scale.

8601. Newcomer, Phyllis & Hammill, Donald. (U Texas, Austin) A short form of the Revised Illinois Test of Psycholinguistic Abilities. *Journal of Learning Disabil-*

*ities*, 1974(Nov), Vol 7(9), 570-572.—Describes a short form of the Illinois Test of Psycholinguistic Abilities (ITPA) developed for use in research projects. Sample items were selected from each subtest so that all the psycholinguistic functions measured by the original test were included in the abbreviated version. Both the long and shortened tests were administered to 83 "normal" children aged 5-10 yrs. *T* tests of differences between subtests mean scores on both versions were computed and were not statistically significant at the 5% level of confidence. Correlation coefficients between the long and shortened version of each subtest were also computed. In all but 1 instance (the Auditory Closure Subtest, correlated at .78), coefficients reached or exceeded the .80 lower level set as acceptable for alternate test reliability. Although these results indicate that the short form ITPA had sufficient reliability to be used for research or screening, it is recommended that the study be replicated on children of uniform chronological age before it is used in clinical settings.—*Journal abstract*.

8602. Patel, K. Scientific Aptitude Test. *Journal of Psychological Researches*, 1972(May), Vol 16(2), 74-79.—Developed an aptitude test to measure the scientific potential of Indian students. The relevance of skills and abilities was determined on the basis of rankings, taken from J. P. Guilford's 1963 study, by scientists of 28 intellectual factors in order of importance for their work. 48 questions in each of 8 broad areas of science were prepared by specialists to meet the test objectives. Parametric data were collected by administration of the test to 1st-yr science students who had achieved a certain level of competence in scientific subjects. Tables of average difficulty values, Davis Discrimination Indices, and intercorrelations are presented.—*B. Lindsey*.

8603. Sakuntala, Velpuri. (Indian Statistical Inst, Calcutta) Simulation studies on determination of test length. *Journal of Psychological Researches*, 1972(May), Vol 16(2), 60-61.—Used an IBM computer to transform samples of random normal deviates to sample observations from a normal distribution with specified mean and variance. Samples were drawn without replacement from the Rand Corporation's 1955 study, *Million Random Digits with 100,000 Normal Deviates*. Results establish that (a) the required (*n* req) as well as the estimated (*n* est) test lengths are large for all lengths of the sample test, with high variation over different tests of the same length, when the true score variance (*S*<sup>2</sup>) is high; (b) *n* req and *n* est are small for all sample tests of different lengths, with lesser variation than in the previous case over different tests of the sample length, when *S*<sup>2</sup> is low; and (c) due to random fluctuations obtained from the sample tests of the same length there are quite large differences in the estimated test lengths.—*B. Lindsey*.

8604. Serpell, Robert. (U Zambia, Lusaka) Aspects of intelligence in a developing country. *African Social Research*, 1974(Jun), No 17, 578-596.—Examines various theories of the psychometric approach to intelligence and their validity in a cross-cultural perspective, such as the emerging African nations. These include the linguistic relativity theory which argues that language restricts perception or, alternately, that it molds abstract concepts. The field dependency theory sees as critical the

style of parental discipline with the children's analytic perception requiring parental enlightenment in Western concepts. Perceptual learning theory permits 2 approaches: modification of the tests or modification of the people. Almost all intelligence tests are Western-oriented, and attempts to construct tests for a different cultural group using nonverbal, non-Western criteria have so far not met with much success. (29 ref)—*A. de la Haba.*

8605. **Tousignant, Michel; Denis, Guy & Lachapelle, Rejean.** (U Sherbrooke, Quebec, Canada) **Some considerations concerning the validity and use of the Health Opinion Survey.** *Journal of Health & Social Behavior*, 1974(Sep), Vol 15(3), 241-252.—Considers that there are still many problems related to the validity of the Health Opinion Survey (HOS) and to the interpretation of its results, despite the wide application of this instrument devised to screen mental disorders in a general population. Data from a validity evaluation of the HOS using 1,158 25-64 yr old Canadian adults are reported. It is argued that this questionnaire possesses some psychometric qualities (stability over time, internal consistency, criterion validity), but there are also many questions related to its validity. The lack of face validity, the absence of a good correlation with the judgment of clinicians, and the influence of 2 biases—physical health and social desirability—militate against the further use of the HOS. It is suggested that 3 categories of problems are screened by high scores—chronic mental disorder, transition stress situations, and bad physical health—and that the HOS not be used in epidemiological surveys of mental disorders because of the numerous methodological questions that remain unsolved. (19 ref)—*Journal abstract.*

8606. **Walsh, James A.** (U Montana) **Comment on Rodewald and Carroll.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 853-854.—H. K. Rodewald and J. L. Carroll (see PA, Vol 52:1952) reported surprise at discovering intransitivities among responses to items used to evaluate attitudes toward faculty members' overall teaching performance. Literature is cited to support the contention that the items were multidimensional and that intransitivity should have been expected.

### Mathematical Models & Statistics

8607. **Buss, Allan R. & Royce, Joseph R.** (U Alberta, Ctr for Advanced Study in Theoretical Psychology, Edmonton, Canada) **Detecting cross-cultural commonalities and differences: Intergroup factor analysis.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 128-136.—Discusses the usefulness of factor analysis in making cross-cultural comparisons. After noting the limitations of previous efforts to arrive at factors common across cultural groups, a more direct strategy is outlined which involves modifying L. Tucker's (see PA, Vol 33:7322) interbattery factor technique to yield intergroup factor analysis. Intergroup factor analysis permits the direct solution of "type" factors common across cultural groups and those unique within cultural groups. It is argued that the potential value of intergroup factor analysis for cross-cultural research lies in the new questions which this technique may address. (42 ref)—*Journal abstract.*

8608. **Corbin, Ruth & Marley, A. A.** (McGill U, Montreal, Quebec, Canada) **Random utility models with equality: An apparent, but not actual, generalization of random utility models.** *Journal of Mathematical Psychology*, 1974(Aug), Vol 11(3), 274-293.—Introduces a probabilistic model for choice and preference that includes A. Tversky's (1972a, b) elimination by aspects model, and the random utility model, as special cases. The present model is based on a covert sequential elimination process, the element that is finally chosen in a simple choice experiment being the eventual lone survivor of the elimination process. The model leads one (a) to question the usual form of simple choice experiments, in which an S must (eventually) choose one of the currently available alternatives, and (b) to suggest that a much more realistic experimental design would allow the S the no-choice option (i.e., he may refuse to accept any of the currently available alternatives).—*Journal abstract.*

8609. **Corcoran, John.** (State U New York, Buffalo) **Discourse grammars and the structure of mathematical reasoning: III. Two theories of proof.** *Journal of Structural Learning*, 1972, Vol 3(3), 1-24.—Contrasts an older theory of proof—the linear theory—with a newer theory—the suppositional—which takes into account important characteristics of mathematical reasoning. Some main ideas needed in constructing a comprehensive theory of proof are developed. The older theory holds that mathematical reasoning proceeds from axioms step-by-step to conclusions in a strictly linear fashion. This theory does not agree with mathematical practice, and the newer theory is seen as resolving this deficit. Examples of rules and proofs are provided. (22 ref)—*R. S. Albin.*

8610. **Davis, James A. & Schooler, Susan R.** (U Chicago, National Opinion Research Ctr) **Nonparametric path analysis: The multivariate structure of dichotomous data when using the odds ratio or Yule's Q.** *Social Science Research*, 1974(Dec), Vol 3(4), 267-297.—Presents a statistical model using odds ratios to evaluate the set of intuitive rules for path analysis of dichotomous variables which is presented in J. A. Davis's text, *Elementary Survey Analysis* (1971). Results support the conclusions that (a) with nonrecursive systems and no higher order interaction effects, the rules are quite valid and can even be simplified; (b) in the presence of interactions and strong skewness on the variables, the rules are not appropriate and (c) the rules are not valid for recursive systems.—*Journal abstract.*

8611. **Fishburn, Peter C. & Keeney, Ralph L.** (Pennsylvania State U) **Seven independence concepts and continuous multiattribute utility functions.** *Journal of Mathematical Psychology*, 1974(Aug), Vol 11(3), 294-327.—Examines concepts based on a preference relation on the set of simple probability measures defined on a set of simple probability consequences. 3 of the independence relations involve gambles, and the other 4 are based on riskless preferences over the  $n$ -tuples in the consequence set. The main theorems state conditions under which 1 or more of the risky independence relations can be derived from a riskless independence relation in conjunction with other conditions. The other conditions include a riskless independence condition which differs from the

one(s) to be derived, the assumption that the consequence set is a convex subset of a finite-dimensional Euclidean space, and the assumption that the individual's von Neumann-Morgenstern utility function on the consequence set is continuous. (29 ref)—*Journal abstract*.

8612. **Greenwald, Anthony G.** (Ohio State U) **Consequences of prejudice against the null hypothesis.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 1-20.—Examined the consequences of prejudice against accepting the null hypothesis through (a) a mathematical model intended to stimulate the research-publication process and (b) case studies of apparent erroneous rejections of the null hypothesis in published psychological research. The input parameters for the model characterize investigators' probabilities of selecting a problem for which the null hypothesis is true, of reporting, following up on, or abandoning research when data do or do not reject the null hypothesis, and they characterize editors' probabilities of publishing manuscripts concluding in favor of or against the null hypothesis. With estimates of the input parameters based on a questionnaire survey of 75 social psychologists, the model output indicates a dysfunctional research-publication system. Particularly, the model indicates that there may be relatively few publications on problems for which the null hypothesis is (at least to a reasonable approximation) true, and of these, a high proportion will erroneously reject the null hypothesis. The case studies provide additional support for this conclusion. It is concluded that research traditions and customs of discrimination against accepting the null hypothesis may be very detrimental to research progress. (44 ref)—*Journal abstract*.

8613. **Haight, Frank A. & Jones, Robert B.** (Pennsylvania State U) **A probabilistic treatment of qualitative data with special reference to word association tests.** *Journal of Mathematical Psychology*, 1974(Aug), Vol 11(3), 237-244.—Uses psychological terminology and notation to develop a theory of qualitative random variables, considering an infinite population of Ss who are presented sequentially with a qualitative stimulus, and supposing that each S replies with a well-defined qualitative response. The postulates of the Yule-Simon (1924, 1955) theorem are proven systematically, and 2 modifications of the Yule-Simon model are proposed in which (a) the probability of a neologism is considered to be dependent on the state of the system and (b) the assumption of equilibrium is not made. The theory is briefly applied to G. K. Zipf's (1949) model.—*B. McLean*.

8614. **Hartmann, Donald P.** (U Utah) **Forcing square pegs into round holes: Some comments on "An analysis-of-variance model for the intrasubject replication design."** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 635-638.—Critically examines the application of fixed-effect 2-way analysis-of-variance procedures to learning data from a single S. Procedures more appropriate for data obtained from intra-S replication designs are briefly described.

8615. **Keselman, H. J. & Leventhal, L.** (U Manitoba, Winnipeg, Canada) **Concerning the statistical procedures enumerated by Gentile et al: Another perspective.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 643-645.—Brings to the attention of operant researchers

statistical procedures that are appropriate for correlated data. The suggestion to use analysis of variance procedures for single-S designs by J. R. Gentile et al (see PA, Vol 49:1519) is discussed. In addition to specifying these statistical procedures, consideration is given to the question of using individual comparison statistics rather than omnibus *F* tests. Specifically, it is recommended that a more powerful test of the experimental hypotheses can be obtained by performing Bonferroni *t* statistics rather than analysis of variance *F* tests.—*Journal abstract*.

8616. **Kratochwill, T. et al.** (U Wisconsin, Madison) **A further consideration in the application of an analysis-of-variance model for the intrasubject replication design.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 629-633.—Argues that the analysis-of-variance model is inappropriate for assessing treatment effects in single-S designs. In particular, such designs are shown to violate the crucial assumption concerning the statistical independence of observations. Alternative methods of data analysis are suggested.—*Journal abstract*.

8617. **Lachin, John M. & Schachter, Joseph.** (George Washington U) **On stepwise discriminant analyses applied to physiologic data.** *Psychophysiology*, 1974(Nov), Vol 11(6), 703-709.—Discusses how stepwise discriminant function techniques with evoked physiologic data can be misused and misinterpreted, pointing out specific pitfalls to be avoided. The various statistical tests of hypotheses used with stepwise discriminant functions, predominantly in the BMD07M computer program, are discussed in relationship to the law of the iterated logarithm. This law clearly shows how highly significant differences will almost always be found when a stepwise procedure is used even though there may be no real differences between groups. As an empirical illustration, a series of physiologic data (EKG and EEG) was collected under stimulus and no stimulus conditions. Stepwise analyses consistently produced significant differences under no stimulus conditions whereas non-stepwise procedures did not. Under stimulus conditions, stepwise analyses consistently exaggerated the extent of differences detected by nonstepwise analyses. (21 ref)—*Journal abstract*.

8618. **Lienert, G. A. & Krauth, J.** (U Düsseldorf, Psychologisches Inst, W Germany) **[Configuration frequency analysis.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1974(Jan), Vol 22(2), 108-121.—Discusses the use of interaction structure analysis as a multivariate nonparametric tool in evaluating designs with repeated measurements. With 1 repetition, the difference method is employed. For *M*-point measurement curves, polynomials are used and their coefficients are treated as pseudo-observables.—*S. D. Babcock*.

8619. **Michael, Jack.** (Western Michigan U) **Statistical inference for individual organism research: Mixed blessing or curse?** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 647-653.—Describes descriptive and inferential statistics as judgmental aids, stimuli to which the scientist can more easily react than to his raw experimental results. The increasing emphasis on the significance test as the main judgmental aid utilized in experimental psychology is credited with several harmful

effects on experimental practice. The area known as "the experimental analysis of behavior" has so far escaped most of these harmful effects, but now we see an increased interest in the development of appropriate significance tests for individual organism research. This interest is based on the view that it is not possible to effect adequate levels of experimental control with much human applied research, and that in such cases a significance test would be quite valuable as a judgmental aid, both of which points are considered to be essentially incorrect, and if accepted, potentially harmful.—*Journal abstract*.

8620. Michael, Jack. (Western Michigan U) **Statistical inference for individual organism research: Some reactions to a suggestion by Gentile, Riden, and Klein.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 627-628.—Presents comments on the suggestion of J. R. Gentile et al (see PA, Vol 49:1519) that analysis of variance models be used for data obtained with reversal designs from a single S. The role of statistical methods in psychology and the implications of this analysis for psychology and behavioral analysis in general are also examined.

8621. Mitroff, Ian I. & Featheringham, Tom R. (U Pittsburgh) **On systemic problem solving and the error of the third kind.** *Behavioral Science*, 1974(Nov), Vol 19(6), 383-393.—Attempts to formulate the error of the 3rd kind—Em, the probability of having solved the wrong problem when one should have solved the right problem. Em is basic to the notion of systemic problem conceptualization. It is shown that Em can be given a precise treatment by considering how the value of a problem state changes as its conceptualization is varied across a set of basic systemic problem representations. Em can itself be represented as a constrained maximization decision problem. (20 ref)—*Journal abstract*.

8622. Molenaar, W. (Rijksuniversiteit Groningen, Netherlands) **[Logistic and normal curves.]** (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Sep), Vol 29(6), 415-419.—Discusses the resemblance between logistic and normal curves. The choice of the best logistic scale factor  $D$  depends on the further specification of the concept of resemblance. R. F. van Naerssen (1950) found that when the factor  $D$  is 1.732 or  $\sqrt{3}$ , it leads to an equal biserial  $r$  in a bivariate distribution. When  $D$  is 1.6 or 1.603, it leads to the smallest possible maximum distance between the logistic and normal densities. For close agreement of density and cumulative curve in the middle region, one should take  $D = 1.5958$ .—A. J. Ter Keurst.

8623. Overall, John E. & Woodward, J. Arthur. (U Texas, Medical Branch, Galveston) **Unreliability of difference scores: A paradox for measurement of change.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 85-86.—Argues that the use of difference scores to measure change in experimental research has often been faulted on the grounds that errors of measurement are additive. It is suggested that in research concerned with differences between experimental treatment groups, the loss in reliability due to calculation of difference scores is not a valid concern because the power of tests of significance is maximum when the reliability of the difference scores is zero.—*Journal abstract*.

8624. Pellegrino, James W. (U Pittsburgh) **A reply to Frender and Doubilet on the measurement of clustering.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 66-67.—Examined the conclusion of R. Frender and P. Doubilet (see PA, Vol 51:10440) that W. Bousfield's (1953) ratio of repetition measure is the best index of clustering. Their conclusions were based upon evidence that the expected value of the measure was independent of amount recalled, but it is shown that measures which involve corrections for chance also have this same independence. It is suggested that selection of a best clustering measure must therefore rest upon other criteria.—*Journal abstract*.

8625. Pinneau, Samuel R. & Ault, John T. (California State U, Northridge) **Univariate and multivariate component analysis.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 955-985.— $F$  values for a large number of different univariate experimental designs with any number of treatment or classification variables can be obtained using the analysis of component variance. These relatively simple procedures are extended to multiple dependent variables, yielding an alternative statistical method to a number of standard regression procedures and to multivariate analysis of variance. As part of this analysis of linear relationships, the variance-covariance matrix, based on standardized dependent variables and then freed of treatment effects, is decomposed. The resulting components, unrotated or rotated, may be evaluated for their psychological meaningfulness as in any factor analytic study. Measures of the effects of the treatments on these components are presented. (23 ref)—*Journal abstract*.

8626. Thoresen, Carl E. & Elashoff, Janet D. (Stanford U) **"An analysis-of-variance model for intrasubject replication design": Some additional comments.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 639-641.—Argues that the fixed-effects analysis of variance (ANOVA) used by J. R. Gentile et al (see PA, Vol 49:1519) for single Ss is inappropriate. D. P. Hartmann's (see PA, Vol 53:Issue 5) proposal of a 1-way fixed-effect ANOVA model is also considered. Time series analysis that takes serial correlation effects into account is recommended.—*Journal abstract*.

8627. van der Ven, H. G. (U Nijmegen, Psychological Lab, Netherlands) **A Bayesian formula score for the simple knowledge or random guessing model.** *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Sep), Vol 29(6), 409-413.—Suggests a new formula for the correction-for-guessing process. The usual formula is based on the regression of the number of items right on the number of items known. The new formula, based on Bayesian statistics, uses the regression of the number of items known on the number of items of the number of items known. The Bayesian condition for the number of items known. The Bayesian formula score assumes that the S either knows the answer or does not, that the probability of choosing the correct alternative is unity whether or not he knows the answer. All alternatives are equally likely. Thus each S is treated in the same way, as one's prior belief about the S being tested is the same for all Ss.—A. J. Ter Keurst.

**Item tree analysis.** *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Sep), Vol 29(6), 475-483.—Compares the problem of the goodness of fit and the interpretation of the outcome of procedures to branches in a tree. The items are branching points and the relationships between pairs of items are branches. An exploratory method of analyzing the order relations in a set of bivalued items is to avoid intransivities. 2 goodness-of-fit measures are presented: (a) Determining the percentage of Ss whose pattern does not contradict the weak partial order. (A weak partial order contains only 1 type of relationship and is directed; i.e., the connecting lines indicate the direction and contain no circuits. No circuits exist when it is impossible to return to the starting point.) (b) Calculating the agreement of the correlations of the items. A 4-stage algorithm is developed: (a) determination of the equivalent items in the matrix, (b) dividing the set of items into a number of subsets that are not connected by any relation, (c) permuting the items remaining from step (b) to construct a reachability matrix (Z) and (d) removing from Z the relations that are induced by other relations.—A. J. Ter Keurst.

8629. Van Leeuwe, Jan F.; Mommers, Martin J. & Smits, Bep W. (Katholieke U, Nijmegen, Netherlands) [Smallest space analysis of some Dutch intelligence and achievement tests.] (*Duth*) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Sep), Vol 29(6), 459-474.—Analyzed the relationships among a number of intelligence and achievement tests in terms of L. Guttman's smallest space analysis (see PA, Vol 43:7555), which judges the comparability of the investigated factors. Ss were 620 6th-grade pupils from 25 Dutch schools. The reference examination was the Interest, School Progress and Intelligence Test. 5 factors were identified: Numerical Abilities, Language Performance, Verbal Intelligence, Space Perception, and Concept Formation. These were determined by factor analysis to be in the figural, verbal, and numerical sectors. The distinction between Rule-Infering, Rule-Appling, and School Achievement factors could not be established. It was possible to identify the tests which were more or less specific in their areas of measurement.—A. J. Ter Keurst.

8630. Van Naerssen, Robert F. (U Amsterdam, Netherlands) **A mathematical model for the optimal use of criterion referenced tests.** *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Sep), Vol 29(6), 431-445.—Develops a mathematical model for a situation in which the learning process of a student is tested under the best conditions, as presented by J. H. Block. These conditions are described by the pattern of testing which requires the student to pass a certain mastery test after a number of attempts with fixed time periods between the tests. The formula is presented.—A. J. Ter Keurst.

8631. Van Naerssen, Robert F. (U Amsterdam, Psychologisch Lab, Netherlands) [Psychometric aspects of the core item method.] (*Duth*) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Sep), Vol 29(6), 421-429.—Proposes a method of developing grading standards that can be used with core items in an

objective teacher-constructed test. Such core items represent the borderline between success and failure and correlate relatively high with total score. F. M. Lord and M. R. Novick (1968) presented several formulas in which the selection ratio,  $s$ , can be a function of 2 item parameters: the corrected  $p$  value and the biserial  $r$ s with ability or total score. It is recommended for teachers of small samplings of students to use the biserial  $r$  method when the biserial  $r$  is in the neighborhood of .5. The formula for  $s$  in such a case is given, as well as the formula for use when the sample is not too small.—A. J. Ter Keurst.

8632. Woodward, J. Arthur & Overall, John E. (U Texas, Medical Branch, Galveston) **Multivariate analysis of variance by multiple regression methods.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 21-32.—Discusses multivariate analysis of variance as a general case of familiar multiple regression analysis. A consequence of this approach is a unified treatment of multivariate analysis of variance which can be used by psychologists who are generally familiar with multiple regression approaches to univariate analysis of variance. It is suggested that the generality of the approach permits solutions consistent with any of the several available strategies for dealing with problems of unequal and disproportionate cell frequencies. Inherent in the multiple regression formulation is the otherwise not so obvious fact that univariate analysis of variance results are an integral part of the multivariate solution and that both are important for understanding complex data. Methods of interpreting multivariate analysis of variance results in complex factorial experimental designs are discussed. (32 ref)—*Journal abstract.*

8633. Wyer, Robert S. (U Illinois) **Functional measurement methodology applied to a subjective probability model of cognitive functioning.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 94-100.—Used functional measurement procedures to test R. S. Wyer and L. Goldberg's (see PA, Vol 44:6638) subjective probability model of cognitive organization. 54 undergraduates estimated the likelihood that a hypothetical person had an attribute ( $P_a$ ) on the basis of information that directly affected their beliefs that persons in general have a particular gene ( $P_a$ ) and that persons who do not have this gene possess the attribute ( $P_{b/a}$  and  $P_{b/a'}$ ).  $P_a$  interacted significantly with both  $P_{b/a}$  and  $P_{b/a'}$ ; each of these interactions was concentrated in the bilinear component, supporting the assumption that each pair of beliefs has multiplicative effects upon  $P_b$ . A small but significant interaction of  $P_{b/a}$  and  $P_{b/a'}$  was also detected, contrary to implications of the model. Although the model provided a good quantitative description of the relations among the beliefs involved without the necessity of introducing ad hoc curve-fitting parameters, small but significant discrepancies from prediction were detected. These discrepancies suggested that  $P_a$  and  $P_{b/a}$  were weighted appropriately, but that  $P_{b/a'}$  should receive a weight inversely proportional to its magnitude. In sum, results support the general formulation proposed.—*Journal abstract.*

## PERCEPTION AND MOTOR PERFORMANCE

8634. Drury, C. G.; Cardwell, M. C. & Easterby, R. S. (State U New York, Buffalo) **Effects of depth perception on performance of simulated materials handling tasks.** *Ergonomics*, 1974(Sep), Vol 17(5), 677-690.—Conducted 4 experiments using a laboratory simulation of a fork-lift truck setting task with a total of 46 male Ss. In general, the same effects were observed as found in an earlier study using fork-lift trucks except that the direction of errors was reversed, showing a reversal of movement relationships in the simulator. The visual angle between the Ss' direction of motion and their line of sight to the target had a large effect on performance times and error rates. When this angle was less than  $12^\circ$ , both times and errors increased sharply. Performance times at different movement amplitudes and target widths were a linear function of an index of difficulty, except for target widths of less than 2% of the amplitude. S age and experience of fork-lift truck driving had a significant effect on performance. Augmentation of vision using a closed-circuit TV display was beneficial to performance, reducing times by 14% and errors by 52%. (French & German summaries)—*Journal abstract*.

8635. Koulack, David & Schultz, Katherine J. (U Manitoba, Winnipeg, Canada) **Task performance after awakenings from different stages of sleep.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 792-794.—In 2 experiments with a total of 16 male undergraduates, performance on both the Trail Making test and a vigilance task did not differ as a function of the sleep stage from which S was aroused. However, performance on the vigilance task was poorer after awakenings from REM periods with higher eye-movement density than after awakenings from REM periods with lower eye-movement density.—*Journal abstract*.

## Perceptual Processes

8636. Birnbaum, Michael H. & Veit, Clairice T. (Kansas State U) **Scale-free tests of an additive model for the size-weight illusion.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 276-282.—In 2 experiments, a total of 36 undergraduates rated the difference in heaviness between 2 objects varying in both size and weight. Assumption of the subtractive model and the use of factorial designs allowed for separation of judgmental effects from psychophysical processes. Difference ratings were rescaled by monotone transformation to fit the subtractive model, yielding scale-free values for the size-weight combinations. The subtractive model provided a good description of the difference ratings, but critical violations of the additive model for the size-weight illusion were obtained. The experiments illustrate how ordinal information can be used to differentiate additive from multiplicative processes. (19 ref)—*Journal abstract*.

8637. Colavita, Francis B. (U Pittsburgh) **Human sensory dominance.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 409-412.—Conducted 4 experiments in which a total of 52 undergraduate psychology students matched an auditory and a visual stimulus for subjective magnitude. Each stimulus was then used as a cue in a reaction-time task. On occasions when both

stimuli were presented simultaneously, Ss' responding was dominated by the visual stimulus. It was also found that on some occasions of simultaneous light-tone presentation Ss were unaware that the tone had been presented. This apparent prepotency of the visual over the auditory stimulus persisted across a variety of experimental conditions, which included giving Ss verbal instructions to respond to the tone when both stimuli were presented simultaneously.—*Journal abstract*.

8638. Cowan, Thaddeus M. (Kansas State U) **The theory of braids and the analysis of impossible figures.** *Journal of Mathematical Psychology*, 1974(Aug), Vol 11(3), 190-212.—Considers impossible figures neither as new perceptual phenomena, nor as examples of known phenomena such as illusions, but regards them as geometric anomalies, not psychological ones, which serve an heuristic function in the study of perception. With this in mind, a topological analysis is undertaken anticipating the following goals: (a) A systematic way (algorithm) of generating these figures should be evident, and (b) simple properties of impossible figures which may not have been previously understood should be discovered. Both of these conditions are met. (19 ref)—*Journal abstract*.

8639. Dixon, N. F. & Henley, S. H. (University Coll, London, England) **Laterality effects in perceptual matching: A preliminary note.** *Perception*, 1974, Vol 3(1), 99-100.—Experimental results of a pilot study support the hypothesis that the solution of spatio-verbal problems which depend on perceptual matching is facilitated when the spatial aspects of the problem are presented to the right hemisphere and the verbal aspects to the left.

8640. Harris, Errol E. **Perceptual assurance and the reality of the world.** Worcester, MA: Clark University Press, 1974. 70 p. \$5.95.—Discusses perception in the light of the phenomenological theories of E. Husserl, M. Heidegger, and M. Merleau-Ponty, and attempts to synthesize a new solution to the problem of transcendence. Also discussed are perception, science, and the developmental view of the world; the activity of self-organization and products; and the concept of veridicality.

8641. Hogan, H. Wayne. (Tennessee Technological U) **Time perception and stimulus preference as a function of stimulus complexity.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 32-35.—Considers time as a socially existential variable that can most meaningfully be measured by comparing 2 or more subjectively experienced durations, each with the other(s). Combining this view of time judgment with the adaptation level-optimal arousal principle, 2 hypotheses were tested: (a) that test stimuli differing in degree of complexity elicit from the individual differential degrees of affect, and (b) that intervals during which the individual is exposed to either overly simple or overly complex stimuli are judged as comparatively longer than objectively equal durations filled with moderately complex stimuli. Data from 137 undergraduates support the hypotheses.—*Journal abstract*.

8642. Kanthamani, H. & Rao, H. Hanumanth. (Inst for Parapsychology, Durham, NC) **A study of memory-ESP relationships using linguistic forms.** *Journal of Parapsychology*, 1974(Sep), Vol 38(3), 286-300.—Conducted a

study with a total of 62 Ss (predominantly high school students) to investigate the interaction between ESP and recall. Ss learned a list of word-pairs and later recalled them, attempting ESP guesses by choosing which of the 2 words was the ESP target. 4 series were conducted—a preliminary, a pilot, and 2 confirmatory series. Results of the pilot and confirmatory series show that correctly recalled trials yielded significant ESP scores. This was not true in the case of the recall-wrong trials. The combined evidence of the 2 confirmatory series was highly significant for the recall-correct trials, while it was insignificant for the recall-wrong trials. The difference between the 2 categories of recall trials was significant in the combined evidence, the correctly recalled trials contributing largely to the difference. It is suggested that under given experimental conditions, successful recall tends to be associated with ESP success.—*Journal abstract.*

8643. Kreidler, Hans & Kreidler, Shulamith. (Tel-Aviv U, Israel) **ESP and cognition.** *Journal of Parapsychology*, 1974(Sep), Vol 38(3), 267-285.—Attempts to develop hypotheses about the life-supporting function of ESP. Examining theories about the phylogensis of ESP shows that 2 of them—the theory of ESP decrease due to bombardment by sensory inputs and the theory of ESP increase due to progressive mental development—lack cogency and factual support. The 3rd theory holds that in spite of its potential survival values, ESP as a means of communication was as rare and weak in the past as it is in the present. This theory leads to the conclusion that the information-transmitting aspects of ESP are only secondary manifestations of a capability employed primarily for performing another and even more vital task. It is hypothesized that this primary task consists in promoting memory retrieval, productive thinking, and other cognitive functions by finding and connecting meaning-related and meaning-complementing cognitive contents. The internal ESP function is probably antagonistic to the external use of ESP for information transmission, thus implying that phylogenetically the communicative function of ESP had to be renounced in favor of thinking and in order to prevent leakage of decisions and plans. Different implications of this hypothesis for psi research and theory are also discussed. (15 ref)—*Journal abstract.*

8644. Lechelt, Eugene C. (U Alberta, Edmonton, Canada) **Pulse number discrimination in tactile spatio-temporal patterns.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 815-822.—Studied spatio-temporal patterning effects on tactile temporal numerosity discrimination. Trains of 4-17 mechanical "taps" were delivered successively at rates of 6, 9, or 12/sec to the finger tips of each hand (thumbs excluded) according to 8 different spatial pattern types. 4 highly trained male Ss were instructed to report only the number of signals counted in each train. Pattern type exerted a significant affect on signal number judgments at rates of 9/sec and 12/sec but not at 6/sec. The number of signals in a train was assessed most accurately when presented in patterns with a predictable spatial ordering. Results indicate that absolute judgments of the number of successive tactile signals delivered to several spatially discrete loci are dependent on the total spatio-temporal pattern and that

tactile temporal numerosity discrimination must be specified in terms of the successive and configurational aspects of a patterned array of inputs.—*Journal abstract.*

8645. Lederman, Susan J. (Queen's U, Kingston, Ontario, Canada) **Tactile roughness of grooved surfaces: The touching process and effects of macro- and microsurface structure.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 385-395.—Conducted 4 experiments in which a total of 22 16-51 yr old Ss made magnitude estimates of the perceived roughness of grooved aluminum plates. 2 aspects of the touching process were altered, and their effects upon roughness examined. Results show that roughness increased with increasing finger force, regardless of whether the S or the E chose the values. Rate of hand motion had a negligible effect on perceived roughness, indicating a roughness constancy and providing further evidence of the relative unimportance of vibratory frequency. The effects of these components of the touching process are discussed in terms of an active-passive continuum rather than a dichotomy. Perceived roughness declined with increasing land width (with narrow grooves), although only over the widest half of the land range; there was no land effect when the grooves were wide. In addition to these macrostructural parameters, the effects of 2 stimulus production techniques were compared. The discrepancies between the 2 sets of data are interpreted in terms of the microscopic irregularities of the plate surfaces. Findings are related to an analysis of perceived roughness of grooved surfaces in terms of static deformation of the skin.—*Journal abstract.*

8646. Loomis, Jack M. (U California, Santa Barbara) **Tactile letter recognition under different modes of stimulus presentation.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 401-408.—Conducted 2 experiments of a total of 7 Ss in which 5 modes of stimulus presentation, 3 of them employing a linear scanning slit, were studied. Results show that the poorest method, stationary flashing of the letter, allowed performance that was well above chance, implying that a purely spatial presentation does convey information. The best performance was achieved when the amount of simultaneous stimulation was limited by using a linear scanning slit. The results of the 5 display modes indicate that Ss used whichever representation, spatial or temporal, was available, although patternings which most closely approximate sequential tracing by a single moving point led to the highest recognition accuracy. Results are interpreted in terms of the limited spatial resolution of the cutaneous sense. While the perception of a letter presented in either full-field condition was limited by the spatial resolution, the perception of a letter traced sequentially was limited by the localization acuity of the cutaneous sense, the best measure being the "error of localization," which is known to be considerably smaller than the 2-point limen. Inasmuch as the slit methods of presentation are a compromise between simultaneous and sequential display, it is suggested that letter-recognition accuracy is better with slit presentation than with the corresponding full-field mode of display. (23 ref)—*Journal abstract.*

8647. Luchins, Abraham S. & Luchins, Edith H. (State U New York, Albany) **Wertheimer's seminars revisited:**

**Problems in perception:** V. Albany, NY: State U New York, Psychology Dept Reports, 1974. 350 p.—Presents discussions and demonstrations that were conducted in Wertheimer's Gestalt Problems Seminars of 1936-1938. Topics include expressiveness of lines, figures, and colors; differentiating between appearance and reality; dreams and reality; Titanism and paranoia; and player vs role player. A discussion of recent replications of aspects of the original projects is also presented.

8648. Lundberg, Ulf; von Wright, Johan M.; Frankenhaeuser, Marianne & Olson, Ulf-Johan. (U Stockholm, Psychological Lab, Sweden) **Note on involvement in future events as a function of temporal distance.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 841-842.—Obtained estimates of the intensity of emotional involvement in 4 potential future events from 29 undergraduates, assuming that the events were to occur at 5 alternative points in time. The overall intensity of involvement varied between events. However, the relation between involvement and time was similar for the 4 events; involvement decreased exponentially with increasing temporal distance.—*Journal abstract*.

8649. Marks, Lawrence F. (Yale U) **On scales of sensation: Prolegomena to any future psychophysics that will be able to come forth as science.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 358-376.—Discusses, using data from the literature, the theory that there exist, for any given sensory attribute, 2 basic underlying scales—one a scale of magnitude, the other a scale of dissimilarity. The psychophysical functions that relate Type I and Type II scales to their corresponding physical scales are in both cases power functions, but the exponents that govern Type I functions are typically about twice as large. Both Type I scales of sensory intensity and Type II scales of sensory dissimilarity are meaningful measures of perceptual experience, but they are measures of different aspects of perception. The duality of sensory scales helps to explain some apparent contradictions among divergent attempts to validate scales of sensation. (126 ref)—*Journal abstract*.

8650. Mazziotti, Alexander. (Barnard Coll, Columbia U) **Intermolecular basis of odour.** *Nature*, 1974(Aug), Vol 250(5468), 645-646.—Examined odor classification and thresholds within the context of the relationship between depth of the pairwise intermolecular potential energy well and the normal boiling point of the molecule. Implications concerning receptor site are noted.

8651. McAuliffe, Wayne K. & Meiselman, Herbert L. (US Army Natick Labs, Pioneering Research Lab, MA) **The roles of practice and correction in the categorization of sour and bitter taste qualities.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 242-244.—Studied 10 adult Ss to investigate the misnaming of stimuli usually called sour (hydrochloric and citric acid) and bitter (quinine sulfate). Ss were given 16 trials in which they were asked to match the stimuli to standards, with or without verbal feedback for each stimulus. This was followed by 16 trials without feedback for all Ss and, several days later, by a 16-trial posttest. Final improved performance of the Ss was not affected by having received the feedback. It is concluded that experience with the stimuli led to a reduction in the degree of

mislaming, implying a nonphysiological basis for sour-bitter confusions.—*Journal abstract*.

8652. McCloskey, D. I. (U New South Wales, School of Physiology & Pharmacology, Sydney, Australia) **Muscular and cutaneous mechanisms in the estimation of the weights of grasped objects.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 513-520.—Conducted a series of experiments in which 28 normal young adults matched the weights of beakers supported in a grasp between fingers and thumb of each hand. Wide beakers felt light, and narrow beakers felt heavy. When increased inward force was used to close the grasping digits upon the beakers, as when elastic bands opposed closure of the grasp or when the grasped object was slippery, the beakers felt light. These illusions occurred whether or not muscular forces along the line of action of the weight were employed in the grasp. It is argued that muscular and cutaneous mechanisms are involved in estimations of the weights of grasped objects. (French & German summaries)—*Journal abstract*.

8653. Rollman, Gary B. (U Western Ontario, London, Canada) **Detection of tactile pulses.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 291-294.—Obtained receiver-operating-characteristic curves for 3 male undergraduates by the rating-scale method for the detection of brief mechanical pulses presented to the finger and dorsal forearm to study differences in detection processes at the 2 sites. An adaptive psychophysical procedure was successful in equating detectability at the 2 sites when data were averaged across sessions. Criteria adopted by the Ss appeared to depend on locus of stimulation, since fewer false alarms were given at the arm than at the finger. (22 ref)—*Journal abstract*.

8654. Stevens, Joseph C.; Marks, Lawrence E. & Simonson, Donald C. (John B. Pierce Foundation Lab, New Haven, CT) **Regional sensitivity and spatial summation in the warmth sense.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 825-836.—Conducted 3 experiments with a total of 98 human males in which results show that the magnitude of warmth sensation aroused by heat irradiation and assessed by the method of magnitude estimation depended on the level of the irradiation, its areal extent, and the particular region of the body stimulated. Within a given body region, area and irradiation level both contributed to the magnitude of the warmth sensation (signifying generous spatial summation of neural signals), except that the proportional contribution of area diminished gradually with increasing level of warmth and finally became negligible as the pain threshold was approached. Some regions of the body were far more responsive than others to low-level heating, but all regions responded more or less uniformly when the level of heating was high enough. (16 ref)—*Journal abstract*.

8655. Svensson, Lelf T. & Lindvall, Thomas. (U Stockholm, Sweden) **On the consistency of intramodal intensity matching in olfaction.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 264-270.—Obtained magnitude matchings of odor intensity for 3 chemical compounds (hydrogen sulfide, pyridine, and dimethyl disulfide) in 4 experiments with 4 student Ss. Results validate the equal-sensation function and indicate that intensity matchings between different intramodal continua are

approximately transitive and symmetric with respect to odor.—*Journal abstract.*

8656. Van Hemert, N. A. (U Amsterdam, Netherlands) **Critique of Bergman and Engelbrektson: An examination of factor structure of Rod-and-Frame test and Embedded-Figures Test.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 827-830.—Critiques the study by H. Bergman and K. Engelbrektson (see PA, Vol 52:2062) which assessed the factor structure of the rod-and-frame test and the Embedded-Figures Test (EFT) mainly because they allow their criterion variables to play a role in the construction of the factors from which the variance of the criteria has to be explained. Further main objections are that in the test battery each of the hypothesized factors is represented by 3 tests only and that the EFT is a modification of 1 of the market tests for the factor which should account for the EFT variance.—*Journal abstract.*

8657. Verrillo, Ronald T. & Schmiedt, Richard A. (Syracuse U, Inst for Sensory Research) **Vibrotactile poststimulatory threshold shift.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 484-486.—Vibrotactile thresholds of detectability were determined at 2 frequencies (40 and 150 Hz) and for 2 contactor sizes (.005 and 2.9 cm<sup>2</sup>) before and after a 5-min period of steady gaussian noise of several bandwidths delivered at an intensity level of approximately 20 db sound level. A duplex system of cutaneous mechanoreceptors may be distinguished, based upon the differential poststimulatory threshold shifts resulting from combinations of adapting stimuli, signal frequency, and contactor size.—*Journal abstract.*

8658. Williams, James E. (Gregg-Harrison Mental Health & Retardation Ctr, Longview, TX) **Stimulation of breast growth by hypnosis.** *Journal of Sex Research*, 1974(Nov), Vol 10(4), 316-326.—Attempted to determine whether hypnotic procedures could influence the physiological mechanism associated with breast growth to produce a significant increase in breast size of females. The 1st phase compared hypnosis with and without suggestion in 6 Ss. The 2nd phase attempted to determine the effectiveness of hypnotic suggestions in breast enlargement in 13 Ss acting as their own controls. It was found that hypnosis with suggestion was effective in stimulating growth. (26 ref)—*E. B. Jaffe.*

### Auditory Preception

8659. Bienvenue, G. R. & Siegenthaler, B. M. (Pennsylvania State U) **A clinical procedure for evaluating auditory localization.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 469-477.—In an attempt to develop a clinical procedure for measuring auditory localization, 32 normal-hearing adults were seated in the center of an array of 7 loudspeakers and were required to identify which loudspeaker was the source of a recorded speech signal for each of 21 test items. Ss were tested once with both ear canals open and with one ear canal occluded. The occlusion of the ear canal induced a sufficient interaural threshold difference in Ss that a reduction in auditory localization ability could be expected. The procedure discriminated well between unoccluded and occluded conditions. (25 ref)—*Journal abstract.*

8660. Cooper, William E. (Massachusetts Inst of Technology) **Perceptuomotor adaptation to a speech feature.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 229-234.—Conducted a selective adaptation study, to test for the presence of a mechanism that mediates an aspect of both speech perception and speech production. 16 university students were instructed to utter /pi/ or /bi/ after listening to repetitions of either of these syllables or to repetitions of the vowel /i/. Analysis of the utterances showed that a timing relation which distinguishes /pi/ from /bi/, namely the latency in onset of voicing relative to the release burst of the consonant, varied systematically for the /pi/ utterances but not for the /bi/ utterances, as a function of the speech input. The effect for the /pi/ utterances was not attributable to factors such as compensation for distorted perception of the /pi/ adapting stimulus or voluntary mimicry of this stimulus. (20 ref)—*Journal abstract.*

8661. Cooper, William E. (Massachusetts Inst of Technology) **Contingent feature analysis in speech perception.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 201-204.—Conducted a study of 14 undergraduates to test the effects of an alternating sequence of 2 adapting syllables, [da] and [t'i], on the perception of 2 series of synthetic speech syllables, [ba]-[p'a] and [bi]-[p'i]. Each of the test series consisted of 11 stimuli varying in voice onset time, a cue which distinguishes voiced from voiceless stop consonants in word-initial position. Results show that the [da]-[t'i] adapting sequence produced opposite shifts in the loci of the phonetic boundaries for the 2 test series. For the [ba]-[p'a] series, Ss made fewer identification responses to the [b] category after adaptation, while for the [bi]-[p'i] series, Ss made more responses to the [b] category. The opposing shifts suggest that the perceptual analysis of voicing in stop consonants is carried out with respect to vowel environment. (16 ref)—*Journal abstract.*

8662. Fitch, James L. (U Southern Mississippi) **Effects of auditory masking on oral sensory perception.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 999-1001.—Administered the Florida Oral Recognition Measure (FORM) to 40 undergraduates in quiet and white noise conditions of 90 and 100 db. There were no significant differences in performance on the FORM during noise or quiet.

8663. Flaherty, Eugene W. & Coren, Stanley. (Swarthmore Coll) **Reaction time as a measure of the effect of selective attention.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 755-761.—In a dichotic-listening paradigm, reaction time was used to monitor the effect of selective attention for 8 volunteer Ss with normal hearing. Reaction times were longer for targets in the nonattended channel, but there was no difference between the performance in the attended channel and a divided attention condition, which may be interpreted as evidence for attenuation of the unattended channel. For all conditions the reaction time for semantic stimuli was longer than that for tonal stimuli, and there was an Attentional Manipulation × Stimulus interaction which may indicate a stimulus-processing component in selective attention. (17 ref)—*Journal abstract.*

8664. Frank, Tom & Karlovich, Raymond S. (Pennsylvania State U, Speech & Hearing Clinic) **Effect of**

**contralateral noise on speech detection and speech reception thresholds.** *Audiology*, 1975(Jan-Feb), Vol 14(1), 34-43.—Speech detection thresholds (SDT) and speech reception thresholds (SRT) for spondee words were obtained on 20 normal-hearing young adults while white or speech noise masking was presented to the contralateral ear. Each masker was presented continuously or pulsed simultaneously with the onset of each spondee word. Several masker sensation levels (SL) were employed, and the amount of masking (threshold shift) was determined for each condition. Small but consistent SDT and SRT shifts were apparent at low masker SLs (30 db). The shifts increased approximately 1 db for each 10-db increase in masker SL between 30 and 60 db. For 60-80 db masker SLs, the shifts were about 3.5 db for each 10-db increase in the masker. The greater threshold shifts at the higher masker SLs may have resulted from transcranial conduction and/or activation of the acoustic reflex. SDT shifts were consistently larger for each masker SL when the masker was pulsed compared to continuous presentation. Data suggest that central masking is operating for masker SLs below 60 db; for higher masker SLs, the increased threshold shifts probably result from a combination of central masking, transcranial conduction, and acoustic stapedius reflex action. Clinical implications of central masking are discussed. (French summary) (24 ref)—*Journal abstract*.

8665. **Gabrielsson, A. et al.** (Karolinska Inst, Stockholm, Sweden) **Frequency discrimination for bands of noise.** *Audiology*, 1975(Jan-Feb), Vol 14(1), 1-20.—Frequency transposition of voiceless consonants has been tried as a method of recoding speech to improve discrimination for profoundly deaf people. The present study investigated the possibility of establishing the minimum hearing capacity a listener must show for a successful use of frequency transposition. Thresholds as minimum midfrequency shift ( $\Delta f$ ) were measured by varying the levels and using noise bands with different  $Q$  factors. Great individual differences were found in 8 selected and 36 unselected normal-hearing young adult Ss. There was a significant difference between (a) threshold values at different  $Q$  factors, (b) threshold values at different frequencies, and (c) threshold values for increasing and decreasing frequency (position of  $\Delta f$ ). There were significant interactions between frequency and position of  $\Delta f$ ,  $Q$  factor and position of  $\Delta f$ , and  $Q$  factor and frequency, as well as a significant triple interaction between  $Q$  factor, frequency, and position of  $\Delta f$ . (French summary)—*Journal abstract*.

8666. **Hicks, Ronald G.** (U St Andrews, Fife, Scotland) **Processing of nonsymbolic auditory information.** *Journal of Auditory Research*, 1972(Jul), Vol 12(3), 228-233.—Cross-modality matching was performed by 8 normal Ss using an electrodermal stimulus as the independent variable and a simultaneous weak adjustable Gaussian noise as the dependent variable. The O's loudness adjustment of the noise was analyzed according to signal detection theory. In a 1969 experiment by R. G. Hicks (see PA, Vol 45:9191) the Os had one or both of 2 difficulties in processing auditory information: (a) O incorrectly perceived the diagnostic value of the auditory signals. (b) O had difficulty integrating correctly perceived auditory information. The present experiment

demonstrates that Os have difficulty with diagnosis of auditory signals, perhaps due to the decay of nonsymbolic auditory information retained in memory.—*Journal summary*.

8667. **Hochberg, Irving.** (Brooklyn Coll, Speech & Hearing Ctr, City U New York) **Most comfortable listening for the loudness and intelligibility of speech.** *Audiology*, 1975(Jan-Feb), Vol 14(1), 27-33.—The effect of instructional set upon most comfortable listening (MCL) was investigated in 14 male and 16 female 18-26 yr old Ss with normal hearing. MCL level and range were determined in relation to listening for comfortable speech loudness vs comfortable speech intelligibility. Results indicate that instructional set did influence listener performance: (a) The mean MCL level for comfortable speech intelligibility was significantly higher (4.96 db) than the mean level for comfortable speech loudness. (b) The mean MCL range for comfortable speech intelligibility was higher by 7.33 db and wider by 7.10 db than the mean range for speech loudness. Ascending stimulus presentation obtained comparable MCL levels for both listening conditions, whereas descending presentation obtained a mean MCL level almost 10 db higher for comfortable speech intelligibility than for comfortable speech loudness. Males achieved slightly higher MCL levels than did females for both loudness and intelligibility criteria. It is concluded that the nature of the instructional set should be taken into account when interpreting comfortable listening measures. (French summary)—*Journal abstract*.

8668. **Holding, Dennis; Loeb, Michel & Yoder, Delmar.** (U Louisville) **"Masking" versus interference in pitch perception.** *Journal of Auditory Research*, 1972(Jul), Vol 12(3), 247-254.—Employed 16 normal-hearing adults as Ss in 2 experiments on pitch discrimination in which noise and pure tone "masks" bore varying temporal relations to 2 stimulus tones presented for comparison. Relatively coarse discrimination (50 cps) and fine discrimination (25 cps) were explored separately. Discrimination was most impaired for short tones, though impairment was minimal with delayed masks. Impairment by pure tone masks was greater than by noise, with immediate masks, and greater for the fine than for the coarse discrimination with postcomparison. One interpretation is that "masking" consists of 2 kinds of disruption, one associated with storage and one with pitch comparison. The data provide no support for the theory that "preperceptual auditory images" are the storage medium.—*Journal summary*.

8669. **Kubovy, Michael; Cutting, James E. & McGuire, Roderick Mcl.** (Yale U) **Hearing with the third ear: Dichotic perception of a melody without monaural familiarity cues.** *Science*, 1974(Oct), Vol 186(4160), 272-274.—B. Julesz (see PA, Vol 50:6089) has shown that cross-correlations between 2 patterns that appear random to either eye alone can give rise to the perception of form and depth when viewed stereoscopically. In a main experiment with 24 Ss and a confirmatory experiment with 12 Ss, auditory analogs were produced by presenting 8 simultaneous and continuous sine waves to both ears and by either phase-shifting or frequency-shifting one of them relative to its counterpart in the opposite ear. Particular tones were shifted in sequence

such that a melody was heard which was undetectable by either ear alone.—*Journal abstract.*

8670. Langford, Cheryl; Bench, John & Wilson, Ian. Some effects of prestimulus activity and length of prestimulus observation on judgments of newborns' responses to sounds. *Audiology*, 1975 (Jan-Feb), Vol 14(1), 44-52.—Examined subjectively assessed responses of 9 normal newborns made by 5 female speech-therapist-audiologist Os. Responses were studied as a function of prestimulus activity level and duration of prestimulus observation period. Response assessment was significantly affected by the former but not by the latter. For sounds which elicited a high proportion of responses, the prestimulus activity level had relatively little effect on judgment of response, whereas for sounds (and no-sound control trials) to which few responses were ascribed, prestimulus activity tended to be associated with positive ratings of response. (French summary) (15 ref)—*Journal abstract.*

8671. Mills, Carol B. & Martin, James G. (U Maryland) Articulatory organization in the prefix effect. *Perception & Psychophysics*, 1974 (Oct), Vol 16(2), 309-314.—Investigated U. Neisser, Y. Hoenig, and E. Goldstein's study (see PA, Vol 43:15246) in which the "stimulus prefix effect" (diminished recall of 7 digits preceded by a redundant prefix) was reduced when the redundant prefix and the recall digits were produced by different speakers. Similar results were obtained using 1 speaker only, but with the prefix and recall digits spoken separately in different utterances and combined by tape splicing. Results support an hypothesis concerning the perception of intact, wholistically organized articulatory units.—*Journal abstract.*

8672. Molino, John A. (National Bureau of Standards, Washington, DC) Measuring human aversion to sound without verbal descriptors. *Perception & Psychophysics*, 1974 (Oct), Vol 16(2), 303-308.—Conducted 3 experiments to investigate the feasibility of making a rudimentary psychophysical determination of human auditory aversion levels for sounds without the use of verbal descriptors. High school students ( $N = 31$ ) tapped rapidly on a telegraph key to reduce the intensity of a continuous acoustic stimulus presented through earphones. Failure to respond resulted in an intensity increase of 1 db every 4 sec. In Exp I Ss responded to 3 pure tones (125, 1,000, and 8,000 Hz) and a white noise. The different asymptotic levels observed after 4 min were taken as a measure of equal-aversion levels for the stimuli. In Exp II the effect of the starting intensity level (45, 70, and 90 db) was determined for a 1,000-Hz tone. Differences in the asymptotic intensity levels observed after 6 min were not significant. In Exp III no significant effect was found upon varying the number of responses required to produce a 1-db intensity decrement in a 1,000-Hz tone. It is suggested that the experiments demonstrated the feasibility of determining equal-aversion levels for sounds. (23 ref)—*Journal abstract.*

8673. Pederson, Olen T. & Studebaker, Gerald A. (Phillips U) A new minimal-contrasts closed-response-set speech test. *Journal of Auditory Research*, 1972 (Jul), Vol 12(3), 187-195.—Presents a new closed-response-set, monosyllabic-word, speech-discrimination test consisting of 3 independent subtests, called the University of

Oklahoma Closed Response Speech Test (OUCRT). In addition to producing overall quantitative results, each subtest is designed to allow phoneme identification analysis in either initial-consonant, final-consonant, or medial-vowel position of the consonant-vowel-consonant, monosyllabic-word test sets. 3 of the 4 items in each consonant test set differ only in the place of articulation of the phoneme in the test position. The phoneme is absent from the test position in one of the words in each consonant test set. The slopes of the articulation-signal/noise function obtained on 10 female and 10 male Ss were 2.3 and 2.4%/db for the 2 consonant subtests and 6.4%/db for the vowel subtest. Error matrix analysis revealed substantial agreement with similar analyses by others.—*Journal summary.*

8674. Roeser, Ross J.; Johns, Donnell F. & Price, Lloyd L. (Callier Ctr for Communications Disorders, Dallas, TX) Effects of intensity on dichotically presented digits. *Journal of Auditory Research*, 1972 (Jul), Vol 12(3), 184-186.—Investigated the role of stimulus intensity in the tendency of Ss to respond more accurately to speech stimuli presented to the right ear than to the left ear. 32 normal hearing Ss, all right handed, were tested by presenting different digits to the 2 ears simultaneously. Sensation levels (SLs) of 10, 30, 50, and 70 db were used for 18 trials each. Right-ear digits were identified correctly more often than left-ear digits, and the 10 db SL produced significantly lower test scores. There were no differences, however, in right-ear laterality as a function of intensity.—*M. B. Meikle.*

8675. Rubin, Martha & Ventry, Ira. (Lexington School for the Deaf, New York, NY) The use of Bekésy audiometry in the measurement of the threshold of intelligibility for connected discourse. *Journal of Auditory Research*, 1972 (Jul), Vol 12(3), 255-260.—64 normal-hearing men and women used Bekésy audiometry to track their Threshold of Intelligibility for Connected Discourse (TICD). The overall TICD was 17.1 db sound pressure level (SPL). The threshold did not seem to be influenced by sex of the listener, attenuation rate (1.25 db/sec vs 2.5 db/sec), or prior knowledge of the speech material. Test-retest reliability was high. A rather precise relationship existed between TICD and Bekésy pure-tone thresholds at 1 kc/sec: TICD was 9 db higher than the pure-tone threshold. The TICD data were compared to other studies of TICD and the implications for the clinical use of Bekésy TICD were discussed.—*Journal summary.*

8676. Schneider, Bruce; Parker, Scott & Stein, David. (U Toronto, Ontario, Canada) The measurement of loudness using direct comparisons of sensory intervals. *Journal of Mathematical Psychology*, 1974 (Aug), Vol 11(3), 259-273.—5 graduate and undergraduate students and the 3 authors were Ss in an experiment which required them in each trial to compare directly 2 pairs of tones and indicate which pair of tones had the greater loudness difference. 10 1200-Hz tones differing only in intensity were employed. Ss made binary comparisons among the 45 tone pairs which can be formed from the set of ten tones. The Ss' binary comparisons of the tone pairs satisfied the transitivity and monotonicity requirements of a positive difference structure. These comparisons of loudness intervals were used to construct a rank

order of loudness difference. A loudness scale was constructed from a nonmetric analysis of the rank order of loudness difference for the 45 tone pairs. Results indicate that loudness is a power function of sound pressure with an exponent of .26. (20 ref)—*Journal abstract*.

8677. Terhune, J. M. (Aarhus U, Zoology Inst, Denmark) **Sound localization abilities of untrained humans using complex and sinusoidal sounds.** *Scandinavian Audiology*, 1974, Vol 3(3), 115-120.—Measured abilities of untrained adults to aim a pointer at a hidden sound source. Ss were 9 males and 11 females (mean age = 29 yrs), all of whom believed their hearing was normal. 2 types of test sounds were used: sine waves and noise bands. The localization errors were  $16^\circ \pm 13^\circ$  and  $13^\circ \pm 10^\circ$  for 1- and 8-kHz sine waves. Females had a significantly larger localization error than males, which might have been caused by a nonauditory factor such as a difference in guessing behavior when faced with a difficult task. The noise band localization ability was significantly more acute than that for sine waves. This difference was attributed to prior experience with the acoustic clues. It is noted that noise bands provide time clues and are common in nature. Sine waves below about 1.4 kHz provide interaural phase clues and those above about 1.4 kHz provide interaural intensity clues. Sine waves are not common in nature, so the Ss had not had the opportunity to develop localizational abilities using these clues.—*Journal abstract*.

8678. Weiler, Ernest M. (U Cincinnati) **Further consideration of adaptation and loudness decrement.** *Journal of Auditory Research*, 1972(Jul), Vol 12(3), 212-215.—Re-examined the use of the Modified Simultaneous Dichotic Loudness Balance (MSDLB) test. Previous results obtained by J. W. Petty, W. D. Fraser, and D. N. Elliott in 1970, showing no difference in loudness adaptation after 7-min exposure vs 15-sec exposure may have been due to the use of 4-sec rest periods for the adapting ear following the 7-min exposure. The present study examined the effect of omitting the 4-sec rest periods, using 10 normal Ss and a 1-kHz tone. Mean adaptation after 15 sec was 10.2 db and after 7 min was 24.6 db, in contrast to the results of Petty et al. The 4-sec rest period therefore appears to have been a crucial variable in the earlier results.—*M. B. Meikle*.

8679. Woodford, C.; Henderson, D.; Hamernik, R. & Feldman, A. (State U New York, Upstate Medical Ctr, Syracuse) **Threshold-duration function of the acoustic reflex in man.** *Audiology*, 1975(Jan-Feb), Vol 14(1), 53-62.—Conducted a study with 5 male and 5 female adult, normal-hearing humans and 3 adult male Ss with hearing loss of cochlear etiology. Reflex threshold was obtained at stimulus durations of 10, 20, 50, 100, 200, and 500 msec and at frequencies of 500, 1,000, 2,000, 3,000, and 4,000 Hz. 3 commercially available acoustic bridges were employed, and a probe-tone frequency of 220 Hz was used. The reflex threshold-duration function for normal-hearing Ss encompassed a much greater range of intensity than the psychophysically assessed auditory threshold temporal integration function. A sex difference was found which may be explained by subclinical noise-induced cochlear pathology in the male

Ss with subsequent truncation of the reflex threshold-duration function. The function was also truncated in the 3 Ss with hearing loss diagnosed to be of cochlear etiology. Implications of these findings for control of stimulus duration in clinical reflex measurement are discussed. (French summary) (33 ref)—*Journal abstract*.

8680. Zakrzewski, A.; Jassem, W.; Prusiewicz, A. & Obrebski, A. (Medical Academy, Poznań, Poland) **Identification and discrimination of speech sounds in monosyllabic meaningful words and nonsense words by children.** *Audiology*, 1975(Jan-Feb), Vol 14(1), 21-26.—Used speech audiometry to examine 297 9-14 yr old Polish children with normal hearing and intelligence level. 10 lists with monosyllabic meaningful and nonsense words were used. All the lists were phonemically and structurally balanced in the same way and were applied with an intensity level varying between 26 and 61 db. Identification and discrimination scores for Polish speech sounds were calculated from written-response sheets. The identification scores were generally significantly lower for nonsense words, and up to a certain extent, increased with age. Examination of the scores showed that confusions were related to the distinctive features of the phonemes. Results represent the 1st stage of a project on speech-sound identification in children and may have practical implications for the rehabilitation of children with hearing loss. (French summary)—*Journal abstract*.

### Visual Perception

8681. Attneave, Fred & Block, Gene. (U Oregon) **Absence of masking in the path of apparent movement.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 205-207.—Conducted a study of 2 graduate students who attempted to detect the movement of a weak probe light that either was or was not located in the path of the apparent movement. Alternation of diagonal pairs of lights produced apparent movement which Ss could organize in either of the 2 ways, as instructed. Results show no evidence of path-specific masking.—*Journal abstract*.

8682. Bernstein, Ira H.; Proctor, Robert W.; Belcher, Joseph & Schurman, Donald L. (U Texas, Arlington) **An analysis of U-shaped metacontrast.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 329-336.—Conducted 2 experiments with a total of 7 university students and faculty in which masking functions were obtained using a brightness-discrimination task similar to that employed by I. Bernstein, R. Proctor, J. Proctor, and D. Schurman (see PA, Vol 51:10239). In Exp I test stimulus (TS) and mask stimulus (MS) energies were held constant, but luminance and duration were varied reciprocally. The obtained masking functions, plotted as a function of stimulus onset asynchrony (SOA), were of an essentially identical U-shape. It is suggested that (a) SOA is a more suitable measure of delay than interstimulus interval and (b) Bloch's law holds for the requisite discrimination. In Exp II TS luminance and MS luminance were varied independently to determine whether the MS served as a frame of reference at short SOA. Results indicate that this was, in fact, the case and that the transition from comparative to absolute judgment strategies as SOA

increases is a major contributor to U-shaped masking functions.—*Journal abstract.*

8683. **Bhatia, Balraj.** (Ministry of Defence, Defence Research & Development Organization, New Delhi, India) **Minimum separable as a function of speed of a moving object.** *Vision Research*, 1975(Jan), Vol 15(1), 23-33.—Values of critical separation at which 2 white bars on a black background appear as fused were determined at distances of 2 and 5 m at speeds ranging from 20 to 210 cm/sec, and for central as well as peripheral vision, with the eyes fixed. Results demonstrate the superiority of peripheral over central vision for the perception of object movement. (French, German, & Russian summaries) (16 ref)

8684. **Blakemore, C. & Over, R.** (U Cambridge, England) **Curvature detectors in human vision?** *Perception*, 1974, Vol 3(1), 3-7.—Required 8 Os to judge apparent straightness following exposure to curved lines. A curvature aftereffect was found when Os had maintained steady fixation or made continuous eye movements at right angles to the chord of the arc during inspection, but no aftereffect was obtained when eye movements had been made in the direction of the chord. It is proposed that curved contours are processed in the visual system by reference to the orientation of local straight-line approximations within an arc, rather than through global analysis of the extent and direction of curvature. The loss in aftereffect with eye movements in the direction of the chord is attributed to nonselective adaptation of orientation detectors. (15 ref)—*Journal abstract.*

8685. **Bodis-Wollner, I.** (Mt Sinai Medical School, City U New York) **A distractive effect of peripheral attention on foveal trigram recognition.** *Perception*, 1973, Vol 2(4), 407-413.—Investigated the recognizability of tachistoscopically presented foveal trigrams as a function of paying attention, or not paying attention, to simultaneously exposed parafoveal trigrams. The same set of stimuli was presented in both conditions to 6 20-30 yr old college graduates with normal vision. 4 other Os served in the pilot study. All 6 Os made a significant number of errors at 50-msec stimulus duration in the attentive condition. Performance reached 95% correct at 200-msec stimulus duration, just when parafoveal trigrams were occasionally identified. At 50-msec stimulus duration in the attentive condition, errors were more marked for non-wordlike center trigrams. When the parafoveal trigram was non-wordlike, its distractive effect was greater than when it was wordlike. The distractive effect of peripheral attention on recognition of letter stimuli suggests that information from parafoveal stimuli is available through attention. Results do not suggest that during a short exposure parafoveal information triggers attention; rather they indicate that conscious attention determines the processing of parafoveal stimuli (17 ref) *Journal abstract.*

8686. **Breitmeyer, Bruno; Love, Rhonda & Wepman, Barry.** (U Houston) **Contour suppression during stroboscopic motion and metacontrast.** *Vision Research*, 1974(Dec), Vol 14(12), 1451-1456.—Conducted a study, using 2 graduate students with normal vision, of visual contour masking obtained when 2 stationary and spatially separated stimuli were presented briefly and

successively in time. Findings indicate that the contour masking typically observed while viewing a stimulus in real movement also occurred while viewing a stimulus in stroboscopic movement. Additional results indicate that the loss of detailed contour information attending stroboscopic movement may contribute to, though not constitute, the contour suppression effects observed in metacontrast. (French, German, & Russian summaries) (25 ref)—*Journal abstract.*

8687. **Cavonius, C. R.** (U Cambridge, Psychological Lab, England) **The relationship between visual acuity and the spatial duty cycle of periodic stimuli.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 295-298.—Measured human visual acuity in 3 experienced Os, using rectangular-wave gratings that had duty cycles (the proportion of each grating period that is light) that varied from .020 to .975. Results indicate that when adaptation level was held constant, the findings support the hypothesis that only the amplitude of the fundamental Fourier component is detected at threshold.—*Journal abstract.*

8688. **Collins, James F. & Blackwell, Loren K.** (U Missouri, Kansas City) **Effects of eye dominance and retinal distance on binocular rivalry.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 747-754.—Tested 6 right- and 6 left-eye-dominant undergraduates for the effects of this dominance on the percent of time that suppression of conflicting line stimuli in the 2 eyes occurred. The amount of suppression depended on whether the suppressed stimulus was a vertical or horizontal line and the distance between the suppressing lines. Results are discussed in terms of rivalry phenomena.—*Journal abstract.*

8689. **Coren, Stanley & Miller, Joel.** (U British Columbia, Vancouver, Canada) **Size contrast as a function of figural similarity.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 355-357.—Conducted a study in which size contrast occurred in numerous configurations where a test figure appeared apparently larger when surrounded by small elements and apparently smaller when surrounded by large elements. Using the Ebbinghaus illusion presented to each of 12 volunteer Os, the magnitude of this effect was shown to vary as a function of apparent similarity between test and inducing element.—*Journal abstract.*

8690. **Coren, Stanley; Bradley, Drake R.; Hoenig, Paul & Girus, Joan S.** (U British Columbia, Vancouver, Canada) **The effect of smooth tracking and saccadic eye movements on the perception of size: The shrinking circle illusion.** *Vision Research*, 1975(Jan), Vol 15(1), 49-55.—Describes an illusory distortion in which the apparent diameter of the path of a target moving in a circle appears contracted at intermediate speeds. In 2 experiments with a total of 36 normally seeing Os, the apparent reduction of path diameter was highly correlated with smooth pursuit behavior of the eye, and the distortion disappeared with the emergence of saccadic movements at higher speeds. In the absence of tracking eye movement the magnitude of the distortion was greatly reduced. Data are discussed in terms of a possible interaction between smooth pursuit and saccadic eye movements in the perception of size, and possible differences in the utilization of information from the 2

eye-movement systems. (French, German, & Russian summaries) (32 ref)—*Journal abstract*.

8691. Cormack, Elizabeth O. & Cormack, Robert H. (New Mexico Inst of Mining & Technology, Socorro) **Stimulus configuration and line orientation in the horizontal-vertical illusion.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 208-212.—Used the method of average error with a mixed design to measure the horizontal-vertical illusion (HVI) for 40 adult Ss. 6 stimulus configurations were combined with 7 angular orientations of the upright standard, and on each trial the variable horizontal was adjusted to appear equal to the standard in length. Results show that for no stimulus configuration did the vertical orientation of the standard yield the greatest illusion. The magnitude of the HVI was dependent upon the stimulus configuration, upon the orientation of the standard, and upon an interaction between these variables. For 2 of the configurations, equal inclinations of the standard to either side of the vertical yielded equal effects; for the other figures, asymmetrical effects were produced. (20 ref)—*Journal abstract*.

8692. Davidoff, J. B. (University Coll Swansea, Wales) **An observation concerning the preferred perception of the visual horizontal and vertical.** *Perception*, 1974, Vol 3(1), 47-48.—Notes perceptual preference for horizontal and vertical lines in a drawing of many equally dark lines. With head tilt, it is lines on the horizontal and vertical with respect to the head tilt that are now preferred. A physiological correlate of this perceptual preference is tentatively hypothesized.

8693. Davies, Peter. (U Bradford, England) **Conditioned after-images: II.** *British Journal of Psychology*, 1974(Aug), Vol 65(3), 377-393.—Conducted 2 experiments in which a total of 25 Ss reported conditioned visual after-images. Exp I examined visual after-images evoked in response to an auditory stimulus and the effects of manipulating the conditioned stimulus-unconditioned stimulus dynamic stereotype. Certain aspects of the data are compared with data obtained in similar experiments in the USSR by I. Bzhalava (1958) and N. and C. Popov (1953) with which there is seen to be a considerable measure of agreement. Results suggest that a light flash (the primary source of unconditioned after-images) may, through repetition, come to acquire the status of a conditioned stimulus. Exp II investigated this latter phenomenon, and evidence is presented which seems to support the view that after-images may be conditioned to a repeated visual stimulus. Other possible interpretations of the observed results are discussed, but these are rejected in favor of the conditioning hypothesis. (30 ref)—*Journal abstract*.

8694. Decker, Larry R. (U Arizona) **The effect of method of presentation, set, and stimulus dimensions on "same," "different" reaction times.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 271-275.—Same-different reaction times (RTs) of 4 paid students to random shapes varying independently in either brightness, size, or form were studied in an investigation of visual encoding and comparison processes. The comparison process was investigated by having the varying dimension either cued in advance (set) or not cued (no set). The encoding process was investigated by varying

stimulus onset asynchronies. No significant difference was found for the set-no-set variables, providing some evidence for an integrality interpretation. It is suggested, however, that the serial and parallel models would still hold if the set variable did not affect either dimensional processing rate or order. The significant difference found between the various stimulus onset asynchronies is interpreted as evidence for a limited-capacity encoding mechanism. Results are also consistent with a 2-process model of comparison processes. (21 ref)—*Journal abstract*.

8695. Deegener, Günther. (Universitäts-Nervenklinik, Abteilung für Kinder und Jugendliche, Homburg Saar, W Germany) **[Dominance of a hemisphere and optical perception with tachistoscope examinations.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Apr), Vol 26(4), 193-201.—Reviews research on tachistoscopic word recognition, and the relationships among monocular vision, eye dominance, and preferred handedness. Temporal lobe dominance can be determined reliably in well controlled experiments. The left hemisphere seems to dominate in perception of familiar optical stimuli and the right in perception of unfamiliar stimuli. (52 ref)—*K. J. Harman*.

8696. Epstein, William & Morgan-Paap, Cynthia L. (U Wisconsin, Madison) **Aftereffect of inspection of a perspectival stimulus for slant depth: A new normalization effect.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 299-302.—36 experimental and 6 control Ss, all undergraduates, made judgments of the frontoparallel plane monocularly and binocularly by adjusting the position of a rotatable thin luminous line viewed in darkness. The judgments were made before and after a 10-min period of monocular inspection of a luminous outline frontoparallel trapezoid which was the projection of a rectangle rotated in depth. Verbal reports indicate normalization of perspectival slant depth (i.e., the inspection figure appeared less rotated), and the line settings exhibited an aftereffect of normalization. It is suggested that the findings may contribute toward an account of certain previously unexplained observations reported in an earlier study by W. Epstein and C. Morgan-Paap (see PA, Vol 52-6612) on adaptation to unocular image magnification.—*Journal abstract*.

8697. Flexman, Jerry E.; Demaree, Robert G. & Simpson, D. Dwayne. (Boston VA Hosp, MA) **Respiratory phase and visual signal detection.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 337-339.—Obtained pneumographic respiration records on 22 female undergraduates during a visual signal detection task. Analysis of signal detection with respect to respiration phase showed that signals presented during exhalation were detected more frequently than those presented during inhalation. It is suggested that the intra-S variation in signal detection performance may be partially accounted for by respiratory behavior at the moment of signal presentation.—*Journal abstract*.

8698. Frisby, J. P. & Clatworthy, J. L. (U Sheffield, England) **Evidence for separate movement and form channels in the human visual system.** *Perception*, 1974, Vol 3(1), 87-96.—Investigated the possibility that the directional and form aspects of a moving stimulus are coded in separate neural locations. 8 psychology students

and staff were Os in Exp I, and 4 practiced male researchers served in Exp II. An adaptation paradigm was used in which sensitivities to grids in optimal apparent movement were measured following an adaptation exposure to a grid in real movement. The postadaptation grids possessed varying degrees of similarity to the adaptation stimulus: they could either have a similar orientation and a similar movement direction, or they could differ on just one of these dimensions, or they could differ on both of these dimensions. Selective adaptation effects were observed which support the hypothesis that different form and movement channels exist in the human visual system. (15 ref)—*Journal abstract*.

8699. **Haimson, Barry R.** (Southeastern Massachusetts U) **The response criterion, the stimulus configuration, and the relationship between brightness contrast and brightness constancy.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 347-354.—Conducted 4 experiments to investigate the nature of the relationship between brightness contrast and brightness constancy while controlling the response criterion, the area of the surround, the stimulus configuration, and the mode of appearance of the modulus target. 10 naive, adult Os in each of the 4 experiments estimated the apparent whiteness or brightness of targets with different contrast ratios. All targets were viewed at several illumination levels. Most constancy (whiteness and brightness) functions displayed shallow slopes that reflected a good approximation to constancy. The functions within Exp I, III, and IV were vertically displaced and parallel; those in Exp II were vertically displaced and increased in slope. It is suggested that decreasing the contrast ratio had no effect on the tendency towards constancy when the area of the surround was greater than that of the target but resulted in a decrease in constancy when the area of the surround was equal to that of the target. (22 ref)—*Journal abstract*.

8700. **Hambrouck, M.** (U Louvain, Ctr de Psychologie Expérimentale et Comparée, Belgium) **[Psychophysical study of simultaneous color contrasts.]** (Fren) *Vision Research*, 1975(Jan), Vol 15(1), 9-21.—Used a visual colorimeter (chromatoscope) to measure 250 contrast colors with a total of 21 Os. Results indicate that, compared with the physical complementarity of the inducing color, the contrast color showed a departure which varied with the inducing hue and also with the luminous level of both inducing and induced tests. This variation of the contrast hue with luminance recalls the classical change of hue. A distinct relationship appeared between induced and inducing color vivacities. Their ratio varied with the inducing hue between a very small value and more than unity. For short wavelength inducing colors (blue), the contrast vivacity was higher than the inducing one. This highly peculiar effectiveness of blue colors, which occurred also in contrast latency, has until now been unexplained. (German & Russian summaries) (22 ref)—*English summary*.

8701. **Harris, Victor A.; Hayes, William & Gleason, James M.** (State U New York, Buffalo) **The horizontal-vertical illusion: Binocular and dichoptic investigations of bisection and verticality components.** *Vision Research*, 1974(Dec), Vol 14(12), 1323-1326.—Conducted 2

experiments with a total of 21 male psychology faculty and graduate students to examine the relative contributions of bisection and verticality to the inverted T variant of the horizontal-vertical illusion. Exp I which utilized binocular presentation of stimuli supported the hypothesis that the magnitude of the horizontal-vertical illusion could be accounted for by simple additive combination of the magnitude of the vertical and bisection subillusions. Exp II replicated the findings using dichoptic presentation (horizontal line to one eye, vertical to the other). Results of both studies taken together indicate that the amount of the horizontal-vertical illusion is due to the separate factors of bisection and verticality and that these processes are central (cortical) rather than peripheral in origin. (French, German, & Russian summaries)—*Journal abstract*.

8702. **Harth, E. & Tzanakou, E.** (Syracuse U) **ALOPEX: A stochastic method for determining visual receptive fields.** *Vision Research*, 1974(Dec), Vol 14(12), 1475-1482.—Develops an algorithm, ALOPEX (Algorithmic Logic of Pattern Extracting Crosscorrelations), which avoids the difficulties concomitant with recording cell responses by intra- or extra-cellular microelectrodes, and which uses a computer to compare responses to different trial patterns and to generate a new trial pattern. Computer simulations and necessary instrumentation are detailed. (17 ref)

8703. **Hendry, Derek P.** (U California, School of Optometry, Berkeley) **Saccadic velocities determined by a new perceptual method.** *Vision Research*, 1975(Jan), Vol 15(1), 149-151.—Describes a method capable of giving a subjective measure of magnitude and velocity of eye movement, with the use of only an oscilloscope and a function generator. The method can be used in perceptual studies in such a way that it is practically impossible for an S to produce spurious "positive" results.

8704. **Herman, John H.; Tauber, Edward S. & Roffwarg, Howard P.** (Montefiore Hosp, Bronx, NY) **Monocular occlusion impairs stereoscopic acuity, but total visual deprivation does not.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 225-228.—Designed an apparatus for testing stereoscopic accuracy which eliminated all cues to depth save binocular disparity. The relative effect of 8 hrs of monocular—as opposed to binocular—occlusion on subsequent stereoscopic performance was tested in 6 Ss. Monocular patching led to significant increases in mean standard deviation and in mean absolute error as compared to baseline testing. Binocular patching led to no such impairment. Thus, true disuse (such as occurs during binocular deprivation) did not impair stereopsis, whereas monocular occlusion, which may involve temporary misuse of the stereoscopic system, did.—*Journal abstract*.

8705. **Hilz, R. & Cavonius, C. R.** (U Munich, Inst for Medical Optics, W Germany) **Functional organization of the peripheral retina: Sensitivity to periodic stimuli.** *Vision Research*, 1974(Dec), Vol 14(12), 1333-1337.—Modulation sensitivity of the peripheral retina in 2 human Os was measured for photopic vision with an interference-fringe method that bypassed the optics of the eye. For all spatial frequencies, sensitivity decreased with eccentricity, but the manner in which sensitivity varied with eccentricity depended on the spatial frequen-

cy of the test object. At 20 c/deg and higher, sensitivity decreased linearly as eccentricity was increased, but when measured with low-frequency test objects, sensitivity remained rather constant until a certain eccentricity (which depends on the spatial frequency) was reached, after which it decreased at the same rate as for high-frequency test objects. (French, German, & Russian summaries)—*Journal abstract*.

8706. Holmgren, John E. (U Maryland) **Visual search in a forced-choice paradigm.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 253-258.—Investigated the processing of visual information in the context of 2 visual search tasks; Ss were 5 right-handed female undergraduates. The 1st task was a forced-choice one in which 1 of 2 alternative letters appeared in a visual display of from 1 to 5 letters. The 2nd task included trials on which neither of the 2 alternatives was present in the display. Search rates were estimated from the slopes of best linear fits to response latencies plotted as a function of the number of items in the visual display. These rates were found to be much slower than those estimated in yes-no search tasks. It is suggested that the processes underlying visual search in yes-no and forced-choice tasks are not the same.—*Journal abstract*.

8707. Holt-Hansen, Kristian. (U Copenhagen, Psychological Lab, Denmark) **Duration of experienced lengthening and shortening of straight lines.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 987-996.—In 2 experiments with a total of 46 18-40 yr old Ss, a vertical straight red line was projected for 60 msec on a gray screen 2 m from S. In Exp I the line was 8.5 cm long and 2 mm wide; in Exp II the line was 17 cm long and 2 mm wide. When fixating on the farthest point of the long and short lines, Ss reported experiencing the line as lengthening from the point of fixation to full length and then shortening to the point of fixation. The durations of the lengthening-shortening phenomenon for both lines were identical. The velocity of this movement was greater for the long than for the short line. A follow-up 6-8 mo later showed that the perceived durations remained constant. Barbiturate (.5 g of hexobarbital) increased durations of the lengthening-shortening. Results are consistent with the suggestion that the source of the lengthening-shortening phenomenon is in cortical brain processes.—*Journal abstract*.

8708. Holt, Gary L. & Matson, Johnny L. (Eastern Illinois U) **Necker cube reversals as a function of age and IQ.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 519-521.—25 high IQ children (above 125) and 25 low IQ children (about 100) ages 7, 8, 9, 10, and 11 yrs were asked to reverse the Necker cube under 3 different instructional sets. The 2nd and 3rd sets of instructions involved the training of 4 different visual perspectives of the Necker cube. Results show that IQ and age both significantly affect the number of reversals of the Necker cube. Except for 11-yr-olds, low IQ children perceived fewer reversals than high IQ children. (17 ref)—*Journal abstract*.

8709. Jones, Robert M. & Tulunay-Keesey, U. (U Wisconsin, Medical Ctr, Madison) **Accuracy of image stabilization by an optical-electronic feedback system.** *Vision Research*, 1975(Jan), Vol 15(1), 57-61.—Describes the performance of an optical-electronic image stabilization

system which uses the contact lens-mirror method for eye-movement tracking in connection with a feedback principle for image stabilization. Results of tests show that the maximum residual image movement was .2' for one S and .6' for another. (French, German, & Russian summaries)

8710. Julesz, B.; Gilbert, E. N.; Shepp, L. A. & Frisch, H. L. (Bell Lab, Murray Hill, NJ) **Inability of humans to discriminate between visual textures that agree in second-order statistics: Revisited.** *Perception*, 1973, Vol 2(4), 391-405.—Introduces 3 new methods that generate 2-dimensional non-Markovian textures with different 3rd-order but identical 1st- and 2nd-order statistics. All 3 methods generate texture pairs that cannot be discriminated from each other. The lack of texture discrimination is the more astonishing since individual elements that form the texture pair are clearly perceived as being very different. However, a counterexample was found that yields discrimination, although the texture pair has approximately identical 2nd-order statistics. This case can be explained by assuming that early feature extractors do some preprocessing. These new demonstrations give support to a model of texture discrimination in which the stimulus is first analyzed by local feature extractors that can detect only simple features such as dots and edges of given sizes and orientations. The outputs of these simple extractors are evaluated by a global processor that can compute only 2nd- or 1st-order statistics (i.e., it can compare at most 2 such outputs).—*Journal abstract*.

8711. Juola, James F.; Leavitt, David D. & Choe, Chong S. (U Kansas) **Letter identification in word, nonword, and single-letter displays.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-A), 278-280.—Conducted a study of 8 undergraduates to test letter identification in 4-letter words, 4-letter nonwords, and single-letter displays, using a 2-alternative, forced-choice procedure. The nonwords were constructed to be pronounceable and orthographically regular. All displays were tachistoscopically presented without pre- or postexposure masking fields. The mean proportions of correct choices were .749 for letters, .735 for words, and .671 for nonwords, with the latter proportion being significantly smaller than those for the other conditions. The relatively high performance for letters was attributed to the absence of masking fields in the present study, since masks have been shown to interfere more with letter processing than word processing in similar studies. The superiority of words over regular nonwords was used as evidence to support the hypothesis that the perceptual unit in reading can be at least as large as a 4-letter word. (15 ref)—*Journal abstract*.

8712. Kelly, D. H. (Stanford Research Inst, Menlo Park, CA) **Effects of the cone-cell distribution on pattern-detection experiments.** *Journal of the Optical Society of America*, 1974(Nov), Vol 64(11), 1523-1525.—Notes that at photopic luminance levels, the cone-cell variation of packing density across the retina provides a natural limit to the effective size of wide-field stimulus patterns. In some experiments, this eliminates the need for small test spots, which produce band-broadening effects in the spatial-frequency domain. Calculations of

these effects are given, to aid in the design of such experiments. (15 ref)

8713. Kennedy, J. M. (U Toronto, Ontario, Canada) **Is gradual recognition of pictures by Ethiopian subjects a differentiation process or a pattern construction process?** *Perception*, 1974, Vol 3(1), 29-31.—Reanalyzes protocols from a report by J. B. Deregowski et al (see PA, Vol 51:8365) of the Me'en tribe who have minimal contact with pictorial materials. It is hypothesized that nonpictorial peoples viewing pictorial test materials may initially recognize details and gradually build up a composite structure, rather than—as Deregowski et al proposed—engage in a process of differentiation from a global mass towards finer discriminations.—*Journal abstract*.

8714. Kintz, B. L. (Western Washington State Coll) **Perception of stimulus location during interocular stimulation.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 515-516.—Flashes of white light were presented separately and randomly to the nasal or temporal hemispheres of each retina. Os responded verbally their decisions as to which eye and which hemisphere had been stimulated. The number of correct responses and latencies at each stimulus position were recorded. The left nasal stimuli produced the shortest and left temporal stimuli the longest latencies, respectively. Nasal positions were perceived the most accurately and the temporal positions the least accurately. Results suggest that Os can inhibit the amount of information that transfers from one hemisphere to the other by either the ascending pathways or through the cerebral commissures.—*Journal abstract*.

8715. Klein, S.; Stromeyer, C. F. & Ganz, L. (Claremont Coll) **The simultaneous spatial frequency shift: A dissociation between the detection and perception of gratings.** *Vision Research*, 1974(Dec), Vol 14(12), 1421-1432.—Results of studying threshold rise and frequency shift under successive and simultaneous conditions indicate that the threshold rise and frequency shift are dissociated. A 1-stage neural model was examined to see whether the frequency shift could be quantitatively predicted from the threshold rise. The predictions were poor. A 2-stage model is thus proposed to account for the results. (French, German, & Russian summaries) (32 ref)

8716. Koenderink, J. J. & Van Doorn, A. J. (U Groningen, Inst voor Experimentele Psychologie, Haren, Netherlands) **Visibility of unpredictably flickering lights.** *Journal of the Optical Society of America*, 1974(Nov), Vol 64(11), 1517-1522.—Measured the sensitivity of the visual system to temporal modulation with unpredictable, aperiodic signals. 3 kinds of stimulation were used: (a) a band-limited gaussian random signal, (b) a passband-limited gaussian random signal, and (c) a periodically quenched random signal. The sensitivity of 2 experienced Os to random signals with narrow frequency bands at high frequencies was governed by the pseudo-flash phenomenon. If the bandwidth was such that the signal contained less than 2 independent samples per second, the psychometric curve followed from the amplitude distribution of the random signal. If the signal contained a larger number of independent samples per second, the psychometric curves were as steep as they are

for sine-wave stimulation. If the De Lange characteristic is the envelope of the sensitivity characteristics of independent channels, sensitive to specific frequency bands, then these experiments permit the estimation of the bandwidth of the most sensitive channel.—*Journal abstract*.

8717. Loomis, J. M. & Nakayama, K. (Smith-Kettlewell Inst, San Francisco, CA) **A velocity analogue of brightness contrast.** *Perception*, 1973, Vol 2(4), 425-428.—Describes an illusion in which, when 2 targets move with the same velocity against a background of smaller moving dots which have a velocity gradient, the target which is moving faster than its immediate surround appears to move faster than the target which is moving slower than its immediate surround. Apparent velocity of a target therefore depends strongly on its velocity in relation to its immediate surround. This illusion is interpreted in terms of motion-sensitive cells which have center-surround antagonisms analogous to the physiological interpretation of brightness contrast.—*Journal abstract*.

8718. Mack, Arien; Fendrich, R. & Fisher, Celia B. (New School for Social Research, New York, NY) **A new illusion of movement dependent on eye movement during head rotations.** *Perception*, 1974, Vol 3(1), 53-62.—Conducted 2 experiments with a total of 24 Os which examined a previously undocumented illusion of movement. The illusion occurred when an O, in an otherwise dark room, attempted to maintain fixation on a stationary light point located straight ahead of him while rotating his head from left to right. The light appeared essentially stationary during head rotations up to about 25°, but with more extreme rotations the point suddenly appeared to sail off in the direction opposite to the head turn. Data indicate that the illusion is a result of unmonitored movements of the eye (i.e., eye movements which are not efferently controlled and about which there is no proprioceptive information), in the direction of the head turn, which occur when the eye is no longer able to maintain fixation by counterrotating.—*Journal abstract*.

8719. Macmillan, Neil A.; Moschetto, Charles F.; Bialostozky, Franklin M. & Engel, Lenore. (Brooklyn Coll, City U New York) **Size judgment: The presence of a standard increases the exponent of the power law.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 340-346.—Conducted 2 experiments in which a total of 80 undergraduate Ss judged the size of circles by the methods of magnitude estimation and magnitude production, with or without a standard figure present. Results indicate that the presence of the standard raised the exponent of the power law. The effect was largely independent of the position of the standard in the range of stimuli. It is argued that the standard's effect was not mediated by a difference in apparent size between perceived and remembered standards, a change in Ss' response strategies, a decrease in sequential dependencies, or other previously identified bias effects. (32 ref) —*Journal abstract*.

8720. Mallenby, Terry W. (Simon Fraser U, Burnaby, British Columbia, Canada) **Effect of discussion on reduction of magnitude of Poggendorff illusion.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 787-791.—In

an experiment with 60 male 6th graders, Ss who were permitted to discuss their responses to the Poggendorff illusion exhibited significantly fewer errors than 2 other groups of Ss who were not allowed to discuss responses. It is suggested that verbalization may play an important role in the processing of perceptual information.

8721. Meyer, Glenn E. (State U New York, Buffalo) **Pressure blindness and the interocular transfer of size aftereffects.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 222-224.—Observed the behavior of 12 female graduate and undergraduate students following a stimulus composed of a top grating with large bar-widths (low spatial frequency) and a bottom grating of narrow lines (high spatial frequency). Results indicate that a subsequently presented test grating of medium bar-width appeared to have a higher spatial frequency on the top half than on the bottom. It is suggested that while this size aftereffect can be obtained dichoptically, this does not imply a central locus, since retinal input from the adapted eye could produce the effect. Ss were tested for the aftereffect in the adapted eye and for interocular transfer with and without pressure blinding the adapted eye. In this last condition, input from the adapted eye could not reach the cortex. However, the aftereffect was equally present under all 3 conditions. This result suggests that size and frequency adaptation have a central locus. (15 ref)—*Journal abstract*.

8722. Nakayama, K. & Loomis, J. M. (Pacific Medical Ctr, San Francisco, CA) **Optical velocity patterns, velocity-sensitive neurons, and space perception: A hypothesis.** *Perception*, 1974, Vol 3(1), 63-80.—Hypothesizes the existence of motion-sensitive cells in the visual system which operate on the optical flow over the retina, and, in so doing, structure the visual field in terms of distinct surfaces that move and/or lie at varying distances from the observer. Concepts of static and dynamic perspective relative to a sphere centered about the eye are developed. It is pointed out that the velocity flow pattern has a very simple form making it amenable to analysis by relatively low-level mechanisms. A higher-order variable of optical flow, the convexity, is defined; assuming a rigid environment, convexity is shown to be related to relative depth. It is then postulated that velocity-sensitive cells having center-surround organization could be linked in such a way as to define a higher-order cell, the convexity cell, having functional properties that make it sensitive to the convexity function. The response profile of a layer of such cells would provide an efficient structuring of the visual field in terms of distinct optical surfaces. It is shown that the convexity cell is insensitive to observer rotations and responds in an invariant fashion to aspects of the optical flow which are related to the surrounding environment. (40 ref)—*Journal abstract*.

8723. O'Callaghan, J. F. (CSIRO, Div of Computing Research, Canberra City, ACT, Australia) **Human perception of homogeneous dot patterns.** *Perception*, 1974, Vol 3(1), 33-45.—Conducted 4 experiments with 8 computer researchers as Ss to ascertain human performance at clustering relatively homogeneous dot patterns. 2 methods for clustering a rectangular array of dots into 2 halves were studied: one increased the separation between the left and right halves, and the other increased

the density of one of the halves. Significant effects were found for array height on the perception of separation patterns and for overall dot density on the density patterns. Results indicate that global properties of dot patterns affected the immediate perception of clusters; consequently, attempts to simulate human perception must incorporate the processing of such global properties. Results also indicate that different perceptual processes operated on dot proximity in perceiving the 2 kinds of pattern. It is suggested that these processes are in fact complementary: one detects perceptual edges, while the other groups areas of similar dot density. (27 ref)—*Journal abstract*.

8724. Oshanin, D. A.; Kremen, M. A. & Pyslar, V. I. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[Some characteristics of the dynamic working image during tracking and "blind" extrapolation.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 132-136.—Studied the tracking of a moving oscilloscope dot after the disappearance of the dot.

8725. Owens, Donald A. & Wist, Eugene R. (Pennsylvania State U) **The temporal course of the relationship between retinal disparity and the equidistance tendency in the determination of perceived depth.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 245-252.—Changes in perceived depth as a function of exposure duration were compared for 2 stimulus conditions; Ss were 24 students. In 1 condition, a depth interval between 2 points of light was produced by the retinal disparity cue, and in the other condition, otherwise identical to the 1st, the light points were connected by a thin luminous line. Results show that the perceived depth interval between the light points increased as a function of exposure durations greater than 1 sec, while no change in the perceived depth interval between the end points of the line occurred. Results are interpreted in terms of a greater equidistance tendency (ET) operating for the line than for the point condition. It is concluded that both the ET and the retinal disparity cue increased in strength as a function of exposure duration. (18 ref)—*Journal abstract*.

8726. Parker, Denis M. (U Aberdeen, King's Coll, Scotland) **Evidence for the inhibition hypothesis in expanded angle illusion.** *Nature*, 1974(Jul), Vol 250(5463), 265-266.—Investigated the perceived orientation distortion of one of a line-pair forming an angle when the 2 lines are unequally illuminated, as compared to the condition when both are equally illuminated. Line-pairs forming acute angles over which luminance was varied independently or in unison were viewed by 15 Ss making 7 settings each. They adjusted a comparison line of constant luminance, positioned 2° from one of the test-figure lines until it appeared equal in tilt to the test line. Results show that the size of the effect varied systematically as a function of the relative—but not the absolute—luminance of the 2 lines. The differences of the magnitude of the perceived distortion as a function of differential luminances was significant ( $p < .01$ ). The effect is interpreted as being due to lateral inhibition involving neighboring orientation-specific cortical units. —A. Cerf-Bearé.

8727. **Ramachandran, V. S.; Rao, V. Madhusudhan & Vidyasagar, T. R.** (Madras Biomedical Assn, India) **Sharpness constancy during movement perception: Short note.** *Perception*, 1974, Vol 3(1), 97-98.—Reports results of an experiment designed to show that the brain has mechanisms for "deblurring" images, at least in the perception of apparent movement. It is suggested that this mechanism of the brain—attributing the absence of sharpness of an object entirely to its movement—be termed "sharpness constancy."

8728. **Rentschler, Ingo & Fiorentini, Adriana.** (U München, Inst für medizinische Optik, W Germany) **Meridional anisotropy of psychophysical spatial interactions.** *Vision Research*, 1974(Dec), Vol 14(12), 1467-1473.—Conducted experiments with the authors as Os in which 2 parallel lines separated by several minutes of arc inhibited each other more strongly when they were oriented vertically or horizontally as compared with oblique orientations. This stronger inhibition from surrounding light partly compensated for the greater contrast sensitivity of vertical and horizontal orientations. Results give some indication that the mechanisms underlying the spatial interactions between 2 lines, in spite of being orientational, are located before the site of convergence of the neural messages from the 2 eyes. (French, German, & Russian summaries) (26 ref) —*Journal abstract.*

8729. **Richards, Whitman & Kaye, Martin G.** (Massachusetts Inst of Technology) **Local versus global stereopsis: Two mechanisms?** *Vision Research*, 1974(Dec), Vol 14(12), 1345-1347.—Data from the measurement of depth sensations in 3 human Os for a range of disparities and bar widths show no evidence that stereopsis involves separate local and global modes of processing. (French, German, & Russian summaries)

8730. **Rosenberg, B. & Langridge, D. J.** (CSIRO, Div of Computer Research, Canberra, ACT, Australia) **A computational view of perception.** *Perception*, 1973, Vol 2(4), 415-424.—Investigates the problems involved in visually perceiving the shape and the edges of dot figures. In determining edges it is not possible to delimit arbitrarily the region on which each point computes. A global computation is defined which leads to a novel way of investigating clustering. When the edges of a figure have been sequenced to yield the boundary it is then possible to determine its shape. The study of shape is confined to convex figures, and an attempt is made to extract global units which correspond to cornerlike regions. It is suggested that a theory which evolves in the manner described has a more unitary aspect than other approaches.—*Journal abstract.*

8731. **Rosinski, Richard R.** (U Pittsburgh) **On the ambiguity of visual stimulation: A reply to Eriksson.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 259-263.—Discusses E. Eriksson's theory (see PA, Vol 51:8236) that visual perception of distance is not solely a function of optical stimulation. It is shown that the optic array does specify distance and that the limitations of visual information are precisely defined in the theory. Visual information alone is insufficient when judgments in arbitrary metric units are required. The limitation of the theory is not in the specification of potential and

effective information, but in the description of the Os' response to that information. (22 ref)—*Journal abstract.*

8732. **Ross, John.** (U Western Australia, Nedlands) **Stereopsis by binocular delay.** *Nature*, 1974(Mar), Vol 248(5446), 363-364.—Studied binocular stereopsis under conditions which controlled for monocular and binocular disparity. Observations were made with an oscilloscope which presented the target figure, an outline square, in repeated 10-msec bursts, at a rate above critical flicker fusion, to each eye simultaneously. The target was centered in a display area which provided a background consisting of a continuously changing random distribution of single dots. Each dot in the distribution was shown to both eyes at the same rate but at different times. When the delay between the eyes was below about 50 msec, the binocular view was observed to reveal a target roughly in the same plane as the noise field. When it was above about 70 msec, the noise field was observed to recede well behind the target. Between 50 and 70 msec, the situation was ambiguous, the background being observed alternately in the plane of the target or behind it. It is concluded that under conditions in which the span for disparity is exceeded, delay alone can determine the relative depth.—*B. Lindsey.*

8733. **Schiffman, H. R. & Thompson, J.** (Rutgers State U) **The role of eye movements in the perception of the horizontal-vertical illusion.** *Perception*, 1974, Vol 3(1), 49-52.—Conducted an experiment with 50 normally seeing undergraduate volunteers to examine eye movements in the determination of magnitude of the horizontal-vertical illusion (HVI). The stimulus figures were presented in conditions where eye movements or tendencies to eye movements were eliminated (i.e., presenting small figures tachistoscopically). The major result indicates that the illusion occurred within these conditions, showing that eye movements do not play a major role in the production of the HVI. However, the finding that the magnitude of the HVI was positively affected in the conditions where tendencies to make eye movements were possible suggests that they exert a secondary role.—*Journal abstract.*

8734. **Shapley, Robert.** (Rockefeller U, New York, NY) **Gaussian bars and rectangular bars: The influence of width and gradient on visibility.** *Vision Research*, 1974(Dec), Vol 14(12), 1457-1462.—Measurements in 2 Os show that narrow gaussian bars were approximately as easy to detect as narrow rectangular bars, but wide gaussian bars were much harder to detect than the corresponding rectangular bars. It is concluded that more than 1 mechanism is required to account for the dependence of bar sensitivity on width. (French, German, & Russian summaries) (20 ref)

8735. **Sigman, E. & Rock, I.** (Rutgers State U) **Stroboscopic movement based on perceptual intelligence.** *Perception*, 1974, Vol 3(1), 9-28.—Conducted a series of 8 experiments with a total of 193 undergraduate Ss which demonstrated that when an object alternately covered and uncovered 2 dots, movement was not perceived provided (a) the object was in the location in front of where a dot had just appeared rather than to the side of this location and (b) the object appeared to be solid or opaque rather than outline. Under such

conditions the dots appeared to be permanently present entities undergoing covering and uncovering. This effect did not require that a physical object with edges progressively occlude and disocclude the dots, since a moving phenomenal square based on subjective contours only and a stroboscopically moving square also eliminated or minimized perceived movement of the dots. Control experiments employing the same spatial and temporal intervals showed that, without the information supporting the covering-uncovering solution, movement typically was perceived. Findings are interpreted as supporting the theory that perception results from a process analogous to intelligent problem-solving. (36 ref) —*Journal abstract.*

8736. **Smithline, Leonard M.** (Cornell U) **Accommodative response to blur.** *Journal of the Optical Society of America*, 1974(Nov), Vol 64(11), 1512-1516.—By use of a blur-pseudostimulus technique and high-speed infrared optometric measurements, the singularity of blur as a stimulus to human accommodation was studied in 4 young adult Ss. Blur was not the sole stimulus; it was a necessary cue, but not a sufficient one. The accommodative system made use of one or more available odd-error (error sign) cues, which, it is believed, supplemented blur with requisite focusing information. —*Journal abstract.*

8737. **Stabell, Bjorn & Stabell, Ulf.** (U Oslo, Norway) **Chromatic rod-cone interaction.** *Vision Research*, 1974(Dec), Vol 14(12), 1389-1392.—The effect of rod intrusion on color-matching functions was investigated, with the authors serving as Os. When a scotopic stimulus was superimposed upon a photopic test beam, the color of their mixture showed gross failures of chromatic additivity. Results are explained on the assumption that the chromatic response of rods may be altered under the influence of cone activity. (French, German, & Russian summaries) —*Journal abstract.*

8738. **Starker, Steven.** (West Haven VA Hosp, CT) **Effects of hypnotic induction upon visual imagery.** *Journal of Nervous & Mental Disease*, 1974(Dec), Vol 159(6), 433-437.—Assessed the effects of hypnotic induction vs task motivation and control conditions with regard to reported vividness of visual imagery. Measures of imagery included the Gordon Scale of Imaginal Control and the Imaginal Processes Inventory. Data from 36 female undergraduates agree with a growing body of related literature in failing to confirm the contribution of hypnotic induction to the enhancement of imagery. The importance of distinguishing between hypnotic imagery and hallucination is stressed, along with the need to integrate this research with more general investigations regarding the nature of mental imagery. (27 ref) —*Journal abstract.*

8739. **Stelmack, Robert M. & Leckett, Walter J.** (U Ottawa, Ontario, Canada) **Effect of artificial pupil size on recognition threshold.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 739-742.—Recognition thresholds for neutral and taboo words increased with a decrease in artificial pupil size for 3 male graduate student Ss. Under a fully dilated condition without artificial pupils, there was a slight increase in recognition threshold. No differences were observed between neutral and taboo conditions. Results suggest that pupil size may be a

plausible mechanism in perceptual defense. —*Journal abstract.*

8740. **Strelow, E. R. & Day, R. H.** (Monash U, Clayton, Vic, Australia) **Visual movement aftereffect: Evidence for independent adaptation to moving target and stationary surround.** *Vision Research*, 1975(Jan), Vol 15(1), 117-121.—Conducted 3 experiments with a total of 60 paid volunteer Ss on the visual motion aftereffect resulting from fixation of horizontally moving vertical bars; the temporal parameters of the stationary surround, also composed of vertical bars, were varied. Results of Exp I show that with small central target and large surround always visible the maximum aftereffect occurred when both were exposed for about 60 sec. Results of Exp II show that with moving target present for 60 sec the maximum was achieved with a surround exposure of about 30 sec, indicating separate and faster adaptation to stationary elements. In Exp III the maximum was constant regardless of the temporal location of this period in the 60-sec exposure of the moving bars, suggesting prolongation or "storage" of the adapted state induced by stationary elements. Data are interpreted as indicating that 2 adaptive processes are involved in the aftereffect and are discussed in terms of relative movement and units specifically responsive to this class of movement. (French, German, & Russian summaries) (22 ref) —*Journal abstract.*

8741. **Stromeyer, C. F. & Klein, S.** (Stanford U) **Spatial frequency channels in human vision as asymmetric (edge) mechanisms.** *Vision Research*, 1974(Dec), Vol 14(12), 1409-1420.—Results of measurements made with the authors as Ss suggest that the channels used in the detection of gratings have a bandwidth similar to the channels revealed by adaptation and masking studies. Analysis of phase sensitivity suggests that the mechanisms have an asymmetric receptive field (edge mechanisms). (French, German, & Russian summaries) (31 ref)

8742. **Stromeyer, Charles F.** (Stanford U) **Form-specific colour after effects in scotopic illumination.** *Nature*, 1974(Jul), Vol 250(5463), 266-268.—Investigated the McCullough effect with luminances stimulating rods but not cones. Dark adaptation curves were obtained from 2 experienced Os. These and 1 inexperienced S were then exposed to the alternation of a horizontal magenta, and a vertical green grating at photopic luminance. The achromatic test pattern of horizontal and vertical gratings was then exposed after Ss were dark adapted and under scotopic luminances obtained during earlier dark adaptation. The color tinge of the McCullough effect was obtained at even the lowest luminance level and increased in saturation with increased scotopic levels. The scotopic colors were later matched with Munsell chips. Repeating the procedure with varying spatial frequencies of adapting patterns showed that the effect remains tied to the adapting spatial frequency even at the lowest scotopic levels of test pattern illumination. Data are interpreted as supporting previous evidence that rod signals influence color mechanisms. (24 ref) —*A. Cerf-Beare.*

8743. **Sullivan, Mark J. & Kertesz, Andrew E.** (Northwestern U, Technological Inst) **The nature of fusional effort in diplopic regions.** *Vision Research*, 1975(Jan), Vol 15(1), 79-83.—2 experiments, employing

2 Ss, carried out psychophysical measures of the magnitude and time course of human fusional effort in diplopic regions. It was found that a fusional effort persisted in diplopia and that its actual magnitude was a function of time. Through careful control of the size and rate of change of stimulus disparities, it was possible to measure the gradual decay of fusional effort in diplopia. Fusional effort was detected in response to stimulus disparities until these disparities were nearly twice as large as the disparity threshold for diplopia. (French, German, & Russian summaries)—*Journal abstract*.

8744. Teller, David A.; Morse, Ralph; Borton, Richard & Regal, David. (U Washington) **Visual acuity for vertical and diagonal gratings in human infants.** *Vision Research*, 1974(Dec), Vol 14(12), 1433-1439.—Describes the development of a 2-alternative forced-choice psychophysical method for use with human infants. An adult O must, on each trial, state in which of 2 possible positions an acuity target is presented, by observing only the infant's eye and head movements. The percent correct responses of the O, for each of several acuity targets, are plotted to yield psychometric functions. The technique was used to test the performance of 1-6 mo old infants toward vertical and diagonal acuity gratings. 20 psychometric functions, accumulated from a total of 8 Ss at 2 illumination levels, and a longitudinal series on 1 S, are presented. No differences were found between psychometric functions generated in the presence of gratings in the 2 different orientations. Results are compared to earlier data in which orientational differences in acuity were shown to exist in human adults. Results are discussed in relation to the development of orientational acuity differences. (French, German, & Russian summaries) (15 ref)—*Journal abstract*.

8745. Thompson, Jack & Schiffman, H. R. (Rutgers State U) **The effect on the magnitude of the horizontal-vertical illusion of horizontal retinal eccentricity.** *Vision Research*, 1974(Dec), Vol 14(12), 1463-1465.—Experimental results indicate that the magnitude of the horizontal-vertical illusion increased from foveal to near peripheral locus of stimulation. Findings are discussed in relation to 2 structural explanations of the illusion, one involving dioptics and the other the neuroanatomy of the eye. (French, German, & Russian summaries)

8746. Trezona, P. W. (City U, London, England) **Additivity in the tetrachromatic colour matching system.** *Vision Research*, 1974(Dec), Vol 14(12), 1291-1303.—The trichromatic system of measurement, although suitable for fields subtending around 2°, does not give a linear metric with larger fields because of the presence of rod receptors. Their presence is allowed for the tetrachromatic color match and so one might expect the tetrachromatic system to be more linear. The present study tested this by comparing tetrachromatic and trichromatic additivity for a variety of test stimuli presented to 3 male Os with normal color vision. Results show that a special case of the additivity principle—luminance metamerism—presented a much more severe test than the general case. No departure from tetrachromatic additivity was detected, although trichromatic nonadditivity was pronounced. Trichromatic additivity failures examined were always in a direction consistent with the hypothesis that "rod color" is blue. An

indication is given of the way in which the additive property of the tetrachromatic color match can be utilized to develop general systems of colorimetry and photometry, applicable at all luminance levels. (French, German, & Russian summaries) (31 ref)—*Journal abstract*.

8747. Tyler, C. W. (U Bristol, England) **Observations on spatial-frequency doubling.** *Perception*, 1974, Vol 3(1), 81-86.—The involvement of disparity detectors in the perception of spatial-frequency doubling in a flickering grating was tested with 4 Os who viewed the grating horizontally. Frequency doubling was unimpaired and must therefore occur independently of disparity detection. A distortion model of frequency doubling was compared with a flicker-detection model, in predicting the appearance of nonsinusoidal gratings. Results support the flicker-detection model but not the distortion model. Physiological considerations suggest that spatial-frequency doubling may be mediated by the transient response of the amacrine cells in the retina.—*Journal abstract*.

8748. Tyler, C. William. (U Bristol, England) **Depth perception in disparity gratings.** *Nature*, 1974(Sep), Vol 251(5471), 140-142.—Describes a method which combines the advantages of random-dot stereograms and of sinusoidal modulation techniques in studying spatial limitations of cyclopean depth perception. High spatial frequency sensitivity may be measured by removing high or low spatial frequency information from one matrix of a stereogram. In this case, stereopsis becomes difficult, if not impossible. This phenomena was examined in 5 human Ss. Stereogratings (continuous variations of both amplitude of disparity and spatial frequency) were viewed through a stereoscope. The limits of such high spatial frequency sensitivity were plotted for 2 of these Ss, so that a disparity-scaling equation was developed. (17 ref)—*R. S. Albin*.

8749. Valberg, Arne. (U Oslo, Norway) **Color induction: Dependence on luminance, purity, and dominant or complementary wavelength of inducing stimuli.** *Journal of the Optical Society of America*, 1974(Nov), Vol 64(11), 1531-1540.—Demonstrates that it is possible to predict the equivalent color-matching coordinates of an induced color for any combination of dominant wavelength and purity of the inducing color stimulus. A quantitative formulation of color induction is suggested that incorporates the dependence on (a) the photopic light adaptation level, (b) the angular size of the annular inducing stimulus, and (c) the time of fixation of the test field. (24 ref)

8750. Walker, B. S. (U New South Wales, Sydney, Australia) **Vividness of imagery and spelling errors.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 823-825.—After an analysis of the spelling errors in a 108-word spelling test, words were categorized as P words or V words. P words were those for which all errors could be attributed to mispronunciation or inapplicable phonetic generalization, and for V words the errors had no such basis. Ss were 63 undergraduates. It was predicted and confirmed that the superiority of 33 good visualizers over 30 poor visualizers (assessed by P. W. Sheehan's version of Betts' Questionnaire Upon Mental Imagery) in spelling performance would be more pronounced for V

words than for P words. Females made significantly fewer errors than males.—*Journal abstract.*

8751. Walraven, P. L. (Inst for Perception TNO, Soesterberg, Netherlands) **A closer look at the tritanopic convergence point.** *Vision Research*, 1974(Dec), Vol 14(12), 1339-1343.—Redetermination of the convergence center for tritanopia showed that the blue system is more sensitive than was concluded from L. C. Thomson and W. D. Wright's (1953) study. The spectral sensitivities of the 3 color mediating systems were derived. The ratio of the number of red, green, and blue receptors in normal trichromatic eyes was derived to be 32:16:1. (French, German, & Russian summaries) (19 ref)

8752. Weintraub, Daniel J. & Tong, Lillian. (U Michigan, Human Performance Ctr) **Assessing Poggendorff effects via collinearity, perpendicularity, parallelism, and Oppel (distance) experiments.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 213-221.—Conducted 3 experiments with a total of 161 paid adult Ss to investigate L. Tong and D. Weintraub's (1974) parallelism-attract hypothesis which was applied to the Poggendorff effect. By adjusting the orientation of, and separation between, 2 free-standing dots, Ss indicated directions and distances associated with the Poggendorff display (a transversal interrupted by parallel lines). Results indicate that judged distance between parallels (with transversal absent) increased slightly when additional interior parallels were added; this Oppel effect is interpreted as contour repulsion. Errors in judging the orientation of an actual transversal segment were too small to account for the Poggendorff effect. The usual large errors occurred for estimates of the orientation of the missing transversal segment between the parallel lines. Cognitive mistracking adequately describes the Poggendorff effect. It is suggested that mistracking is a function of the angle subtended between transversal and parallels, and of the orientation of the entire display. (25 ref)—*Journal abstract.*

8753. White, K. D. & Riggs, L. A. (Brown U) **Angle-contingent color aftereffects.** *Vision Research*, 1974(Nov), Vol 14(11), 1147-1154.—Results of 5 experiments with a total of 38 Ss, indicate that visual aftereffects of color, contingent on the stimulus pattern, provide evidence that angle-contingent aftereffects may be mediated by broadly tuned mechanisms different from those which mediate line orientation. Angle-contingent aftereffects generalized to test patterns made up of curves, and curvature-contingent aftereffects generalized to angles. Some characteristics of angle-contingent aftereffects can be explained by a neural substrate with characteristics like those that have been reported for higher-order hypercomplex cells in the visual cortex. (French, German, & Russian summaries) (17 ref)—*Journal abstract.*

8754. Williams, R. (U Bristol, Brain & Perception Lab, England) **Investigation of temporal integration by video sampling.** *Perception*, 1973, Vol 2(4), 441-490.—Conducted 8 preliminary experiments with a new video sampling apparatus to measure the maximum visual temporal integration time (critical duration) at various background intensities. The aim was to determine to what extent this phenomenon is attributable to

either central or peripheral events. The extended integration period found for the number recognition task is interpreted as evidence of a central process. An attempt was made to demonstrate information integration using a rotating form in a similar identification-discrimination situation. Monocular, binocular, and dichoptic arrangements were employed, and the amount of dichoptic summation of form information, achieved by both normal and strabismic Ss without stereoscopic depth perception, was used to test 2 theoretical models of binocular fusion. In addition, stereoscopic depth was generated with uncorrelated sampling of the left and right images, which may be due to the action of a "fusion hierarchy." Signal detection theory is suggested as a possible solution to the problem of expectation effects in identification-threshold experiments. (5 p ref)—*Journal abstract.*

8755. Wolford, George & Hollingsworth, Samuel. (Dartmouth Coll) **Lateral masking in visual information processing.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 315-320.—Conducted a study of 20 undergraduates to examine the space effect with retinal locus and processing order unconfounded. Conditions were also included to distinguish between various explanations of asymmetry. Letter strings were presented at a variety of retinal locations, and spaces were inserted into different positions in the instructed left-right processing order. Results show that the space effect was unrelated to processing order, but it was dependent on retinal location. To account for the various asymmetries, it was necessary to postulate that letters tend to interact with adjacent letters and that the interaction was not spatially symmetric. It was also found that spaces had greater effects on "right-hand" letters than on symmetric letters. It is concluded that letters interact at the feature level. (24 ref)—*Journal abstract.*

### Motor Processes & Performance

8756. Annett, Marian; Hudson, P. T. & Turner, Ann. (Open U, Bletchley, England) **The reliability of differences between the hands in motor skill.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 527-531.—In Exp I measures of manual speed on a peg-moving task were repeated after intervals ranging from 7 wks to 18 mo with 53 undergraduates and 20 11-45 yr old other Ss. Significant test-retest correlations were found for each hand and for the difference between hands. In the same task in Exp II with 3 right-handed postgraduate researchers, practice improved the speed of each hand but did not eliminate the difference between them. This measure of manual asymmetry can be regarded as moderately reliable. (French & German summaries)—*Journal abstract.*

8757. Arstila, M.; Wendelin, H.; Vuori, I. & Välimäki, I. (Turku U Hosp, Finland) **Comparison of two rating scales in the estimation of perceived exertion in a pulse-conducted exercise test.** *Ergonomics*, 1974(Sep), Vol 17(5), 577-584.—With the aid of a feedback system, linear accelerations of heart rate of 4, 5, or 8 beats/min were obtained in 90 bicycle-ergometer tests on 30 29-47 yr old healthy policemen, and the linearity of 2 rating scales for the perception of exertion was studied. The new scale described by G. Borg (1962) and the modification described by the authors both gave highly

linear, repeatable, and mutually comparable results. The 1st scale gave the best performance in many respects and is the more preferable. At the same time the reproducibility of the pulse-conducted test results was studied and found to be very high for work load and exercise blood pressure readings, and also with the new acceleration of 8 beats/min<sup>2</sup> which was studied for the 1st time. The virtues of linear acceleration of heart rate in ergometric testing and of the pulse-conducted test method are discussed. (French & German summaries)—*Journal abstract*.

8758. Catalano, John F. (State University Coll New York, Cortland) **End-spurt following simple repetitive muscular movement.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 763-766.—Studied the nature of end-spurt in a task requiring pure muscular activity (tapping a telegraph key) using 170 undergraduates. Significant end-spurt occurred when Ss believed the task was 90% completed. However, in contrast to other tasks, performance improved on the critical trial for all conditions. This was interpreted as being due to arousal resulting from onset of a signal light rather than to any significance the light might have had. It is suggested that a variable influencing end-spurt might be the length of time spent at a task. In this type of task, the amount of recovery from decrement which occurs through end-spurt is only a small portion of the total decrement which has previously occurred. Optimization of performance level could probably best be achieved through distributed work periods where rest would be introduced prior to the occurrence of decrement.—*Journal abstract*.

8759. Filippovich, V. I. & Petrosian, E. A. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of Child & Juvenile Physiology, Moscow) **[Motor skill development as a function of the timing of knowledge of results.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 65-76.—Studied the improvement in performance of simple motor skills as a function of (a) the time between the end of a series of learning trials and the presentation of knowledge of results (KR) and (b) the time between KR and the beginning of a new trial series. The skills consisted of jumps to a predetermined height, knee bends of a predetermined depth, and similar tasks performed under easy and difficult conditions. KR was presented concurrently with performance or after intervals of 10-90 sec after the completion of a number of trials. Additional trials were given immediately following the presentation of KR or after varying intervals of delay. Ss were boys 8-12 yrs old. Greatest improvement in performance was achieved when KR was delayed about 20 sec, and the effect was greater for the more difficult task conditions. Results are discussed in terms of the inhibitory effect of the orienting response upon information processing. (English summary) (17 ref)—*L. Zusne*.

8760. Kennedy, Crawford; Van Huss, Wayne D. & Heusner, William W. (Michigan State U) **Reversal of the energy metabolism responses to endurance training by weight loading.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 847-852.—6 university distance runners were randomly placed into experimental and control groups to determine the effect of progressive overloading with weights on selected training responses. Both groups

received identical training for 8 wks with the exception that 3 days/wk the experimental Ss wore weighted wristlets, anklets, and belts. Pre- and posttest energy metabolism measures were taken during and following both a low-intensity 15-min run (9.7 km/hr, 0% grade) and a high-intensity run to exhaustion (16.1 km/hr, 9% grade). The energy metabolism responses to endurance training were significantly reversed by the progressive overloading with weights. The energy cost of the low-intensity run was increased, and an unexpected shift toward greater anaerobic metabolism was observed. (17 ref)—*Journal abstract*.

8761. Lepikhova, L. A. (Scientific Research Inst of Psychology, Kiev, Ukrainian SSR) **[The physiological basis of "mental tempo."]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 137-140.—Studied the relationship between individual differences in the rate of movement (self-determining tapping rate) and physiological measures of the Pavlovian properties of the nervous system. (21 ref)

8762. Rondal, Jean A. (U Liège, Lab de Psychologie Expérimentale, Belgium) **[Intervention of interior language in the regulation of motor behavior and its electromyographic control.]** (Fren) *Revue de Psychologie et des Sciences de l'Education*, 1973, Vol 8(4), 491-501.—Studied the regulatory role of inner speech in voluntary motor behavior. In Exp I, 8 adult Ss were instructed to perform several motor tasks. At the end of each task they were interviewed as to their inner verbalizations during performance. Verbalizations often occurred if the task was difficult enough. In Exp II, electromyographical records of labial movements, associated with inner speech, confirmed the frequent occurrence of specific verbomotor phenomena during the tasks. (French & English summaries)—*Journal summary*.

8763. Sovik, Nils. (U Trondheim, Norway) **Developmental trends of visual feedback control in copying and handwriting performances of children aged 7 through 11 years.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 919-930.—According to neurogeometric motion theory, S would experience changes in normal feedback information as perturbations in executing copying and handwriting activities. Sensory feedback mechanisms in such psychomotor skill performances seem to depend on perceptual-motor abilities, and thus play an important role in such behavior. Hence, a parallel developmental trend regarding feedback control in copying-handwriting behavior was predicted. A study organized as a 2-way design with 48 7-11 yr olds showed that different forms of displaced feedback had different negative effects on accuracy and speed in copying-handwriting performances, whereas an improved feedback control in the same functions could be observed from Ss at the ages tested. No interaction effects were found. (27 ref)—*Journal abstract*.

8764. Werner, Peter. (Miami U) **Education of selected movement patterns of preschool children.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 795-798.—Determined the effects of a program of guided instruction in locomotor, stability, and manipulative movement patterns on the physical performance patterns of nursery school children. 36 Ss took a test, then took part in a learning program for 8 wks. The children learned

physical education experiences as part of the regular nursery school program. All Ss were given a final test on the criterion variables. Principal conclusions from an analysis of covariance were that (a) a program of guided instruction in locomotor, stability, and manipulative movements at the nursery school level led to significant improvement in motor patterns, and (b) there were no significant differences in performances of the boys and girls in these motor patterns.—*Journal abstract.*

## COGNITIVE PROCESSES AND MOTIVATION

8765. Das, J. P.; Kirby, J. & Jarman, R. F. (U Alberta, Edmonton, Canada) **Simultaneous and successive synthesis: An alternative model for cognitive abilities.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 87-103.—Current theories of the structure of cognitive abilities are critically examined and are found to lack adequate description of the processes underlying the abilities. An alternative model, A. Luria's (1966) theory of simultaneous and successive syntheses, is presented and discussed. This model of information processing is supported by factor analytic studies of cognitive abilities and then related to data from studies of memory, imagery, and language. A model of abilities in terms of a structure-process distinction is proposed. (64 ref)—*Journal abstract.*

8766. Foulkes, David & Fleisher, Stephan. (U Wyoming) **Mental activity in relaxed wakefulness.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 66-75.—Attached electrodes to 20 young adults for EEG and electrooculogram (EOG) recording. Each S then lay down in a moderately illuminated room, isolated from Es, under instructions to "relax, but stay awake." At 6 randomly selected times, an E gave a signal. The S then reported his very last presignal mental experience and answered a series of questions about it. On most trials, Ss reported endogenous sensory imagery. Of all reports, 19% were described by Ss as hallucinatory, and 25% were reliably judged as regressive. Hallucination and regression were relatively independent report characteristics, rarely occurring together. By both subjective and EEG-EOG criteria, Ss were awake when experiencing this hallucinatory and/or regressive mentation. Results suggest that (a) sleep-mentation retrieval and analysis techniques can be applied fruitfully to waking-thought samples; (b) relaxed waking thought is fairly susceptible to momentary intrusions of bizarre content or hallucination; (c) such qualities emerge in a variety of psychophysiological conditions and without any extraordinary induction techniques; and (d) the paradigm opens interesting new possibilities for studying similarities and differences between waking and sleeping thought. (28 ref)—*Journal abstract.*

8767. Kantowitz, Barry H. (Ed.). (Purdue U) **Human information processing: Tutorials in performance and cognition.** Hillsdale, NJ: Lawrence Erlbaum, 1974. x, 365 p. \$18.—Presents 7 technical papers on methodologies and models in the study of human information processing. Topics include the interpretation of reaction time in information processing research, double stimula-

tion, the mechanics of thought, and theoretical perspectives on the perception of printed English.

## Learning & Thinking & Conditioning

8768. Allen, Mary J. (California State Coll, Bakersfield) **Sex differences in spatial problem-solving styles.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 843-846.—47 female and 46 male undergraduates completed a battery of spatial tests taken from the Kit of Reference Tests for Cognitive Factors (e.g., Card Rotations Test, Cube Comparisons Test, and Map Planning Test) and list containing 14-20 possible strategies to be checked if they had been used on specific problems. Significant sex differences were observed on reported strategies for 3 of the tests (Card Rotations, Choosing A Path, and Map Planning). Most of the strategies showing significant sex differences were general, rather than test-specific, in nature. Women more often marked strategies like "no particular strategy" or "guessing." Results indicate that while most men and women reported using the same set of problem-solving strategies, women are less efficient in using these methods.—*L. Gorsey.*

8769. Ball, Portia M. & Cantor, Gordon N. (U Iowa) **White boys' ratings of pictures of whites and blacks as related to amount of familiarization.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 883-890.—120 4th- and 5th-grade white boys were shown photographs of 4 white and 4 black boys, which were presented 1, 5, 10, or 20 times. Ss then rated these photographs, plus 2 (1 white, 1 black) not previously exposed, on a scale indicating the extent to which they "would like to bring the boy home to spend some time with them and their families." The black pictures were rated more favorably than were the white pictures and increasing familiarization was associated with an increase in favorability for black pictures but a decrease for white pictures. The attitudinal effects of stimulus familiarization are discussed.—*Journal abstract.*

8770. Blanchard, Edward B.; Young, Larry D.; Haynes, Mary R. & Kallman, Mary D. (U Mississippi, Medical Ctr, Jackson) **A simple feedback system for self-control of blood pressure.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 891-898.—Describes a simple, open-loop, feedback system, based on closed-circuit TV, which can be used to teach Ss to control their blood pressure, along with 2 experiments which demonstrate its efficacy. Results show a consistent advantage for blood pressure lowering of the new feedback system over binary feedback or no feedback, which did not differ from each other.

8771. Brunette, Stephen A. & Battig, William F. (U Colorado) **Recognition of pictorial as compared with verbal descriptions.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 524-526.—After being presented with either photographs and/or sentential descriptions thereof, 64 undergraduates were tested both for pictorial and verbal recognition both immediately and after 48 hrs. Superior recognition was found for the type of material presented during study, primarily due to very poor pictorial recognition by Ss who had studied sentences. No decrement was found over the delay interval, which actually produced facilitation for the nonpresented modality.—*Journal abstract.*

8772. **Calvano, Michael A.** (Kansas State U, Coll of Education) **Predicting the use of imagery as a mediation strategy.** *AV Communication Review*, 1974(Fal), Vol 22(3), 269-277.—Gave 100 college students a paired-associate task and asked them to use imagery to form an association between the pairs. The stimulus item was a line drawing. Ss were asked what associations were used for each stimulus-response pair, and were given 5 cognitive factor tests. The tests and their associated factors were the Object Naming Test, spontaneous flexibility; the Hidden Figures Test, field dependence; Sheehan's short form of the Bett's Vividness of Mental Imagery test, vividness of imagery; the Form Board Test, visualization; and the Card Rotation Test, spatial organization. A self-report mediation survey for use of imagery as a mediator also was used. Only the Hidden Figures Test was a significant predictor and only for 1st-trial scores. Of the associative mediators reported by the students, 38% were of a concrete imagery type.—*D. E. Anderson.*

8773. **Dornič, Stanislav & Stone, LeRoy A.** (U Stockholm, Inst of Applied Psychology, Sweden) **Performance and perceived difficulty in paced and self-paced tasks.** *Reports from the Institute of Applied Psychology, University of Stockholm*, 1974, No 46, 6 p.—Studied the effect of time stress on the relation between objective (performance) and perceived difficulty. 3 serial tasks of increasing complexity were used, all of them involving high information load, with 28 18-20 yr old students. The tasks consisted of successively presented complex items which required differentiated responses according to a given code, each task performed with and without time pressure. In the time pressure condition the presentation of items was presented at fixed intervals while in the other condition the presentation was self-paced. Results show that with increasing complexity, performance deteriorated; perceived difficulty increased considerably more in the paced condition. It could be demonstrated that in cases where performance in the 2 conditions was the same, paced tasks were experienced as more difficult than self-paced tasks. This is interpreted as due to different "subjective costs" responsible for identical performance.—*Journal abstract.*

8774. **Durding, Bruce M.; Becker, Curtis A. & Gould, John D.** **Data organization.** Yorktown Heights, NY: IBM Thomas J. Watson Research Center, 1974, 40 p.—Reports 3 experiments with undergraduate Ss that investigated how people organize data (word lists) when they do not have to perform any subsequent tasks with the data. Results are discussed relative to the use of computer-based information retrieval systems. (17 ref)

8775. **Eisler, Richard M.; Hersen, Michel & Miller, Peter M.** (VA Ctr, Jackson, MS) **Shaping components of assertive behavior with instructions and feedback.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1344-1347.—Describes the use of instructions and immediate feedback in sequentially shaping target assertive behaviors. Deficiencies in assertive behavior were assessed in 2 male Ss by means of ratings of videotaped interactions. Training involved rehearsals of standard assertive situations unrelated to the Ss' real-life problems. There was relatively rapid acquisition of

component assertive behaviors during training. These improvements also generalized to untreated rehearsals of the Ss' real-life problems. The clinical implications of the training procedures are discussed.—*Journal abstract.*

8776. **Fromme, Donald K.; Whisenant, William F.; Susky, Helen H. & Tedesco, John F.** (Oklahoma State U) **Group modification of affective verbalizations.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 866-871.—Data from 48 17-45 yr old college students demonstrate that complex "here-and-now" affective verbalizations, basic to most experiential or therapeutic groups, can be reliably induced in a group by techniques, reinforcement techniques. Further, reinforcement produced levels of performance equivalent to that induced by therapists. Post-hoc analysis of therapist behavior suggested that therapist effectiveness was enhanced by greater task orientation, more frequent modeling of desired behavior, and by fewer overall interventions by the therapist. The feedback/reinforcement procedures were generally viewed as slightly less positive than unled or therapist-only conditions. This may have been due to the novelty of the feedback apparatus and to greater pressure to perform under feedback conditions. (18 ref)—*Journal abstract.*

8777. **Gardner, Rick M.; Mo, Suchoon S. & Krinsky, Richard.** (Southern Colorado State Coll) **Inhibition of pupillary orienting reflex by heteromodal novelty.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 510-512.—Data from a total of 8 undergraduates who participated in 2 experiments show that when recognition memory was well formed, pupillary orienting reflex to novel auditory stimulus items was inhibited. Instead, pupillary dilation occurred to familiar stimulus items provided the task was relatively difficult. The relation between orienting reflex and recognition memory is interpreted in terms of negative induction arising from the direction of the reflex in the context of Pavlov's theory.—*Journal abstract.*

8778. **Gaziev, E.** (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[Transfer of methods of generalization in school children.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 116-123.—Compared the relative advantages of 3 methods of reasoning that were learned with one type of task and transferred to the performance of other similar tasks. Ss were 3 experimental groups and a control group of 20 6th graders each. The methods were (a) deduction, (b) induction, and (c) reasoning from a single case to general cases to other single cases. All 3 methods were effective. Methods (b) and (c) did not differ in the transfer of learning, but both methods were superior to Method (a), deduction. Neither insight nor a gradual way of arriving at generalizations were specific to any of the 3 methods but depended more on the difficulty of the task and on individual differences among learners. (English summary)—*L. Zusne.*

8779. **Greer, G. B.** (Queen's U, Belfast, Northern Ireland) **Sets, logic and concepts: I. Structural links.** *Journal of Structural Learning*, 1973, Vol 4(1), 61-83.—Describes a procedure which can be used to show that certain types of set operations, relations, concepts, and patterns and logical connectives all have the same underlying structure. The relationships of these processes

to studies of concept formation and logical thinking are also examined.

8780. Grigorian, K. K. & Nikiforova, O. I. [Individual differences in the solution of some creative problems.] (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 141-144.—Established 3 personality types on the basis of the nature of drawings done by 464 Ss in 9 cells on a sheet of paper following instructions to draw that differed in the degree to which drawings were to follow a prescribed theme.

8781. Gurova, L. L.; Miroshkina, E. A. & Polivanova, N. I. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) [The study of intuitive processes in problem solving.] (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 41-53.—Describes and discusses the results of a number of experiments on the use of intuition in problem solving. Verbal and visual tasks that required the filling in of missing information were used. It is concluded that the intuitive aspect of thinking is a function of the objective information structure of the problem. Intuition manipulates hypotheses that compensate for the lack of subjective information and the inability to pull all of the elements of the problem together in a logical fashion. In intuition both semantic and formal informational items are used simultaneously. This allows the problem-solver to identify those points that carry the most information in terms of determining the direction of search and its selectivity. Semantic relationships and generalizations are significant landmarks that are utilized in the intuitive problem-solving process, but even information of little significance and isolated semantic elements may trigger the correct solution of the problem. (English summary) (22 ref)—L. Zusne.

8782. Halpern, Joseph & Lantz, Alma E. (U Denver) Learning to utilize information presented over two sensory channels. *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 321-328.—Conducted 3 experiments with a total of 300 undergraduate volunteers in which Ss were provided with auditory, visual, or simultaneous auditory and visual information in a classification task. Difficulty of classification was manipulated by varying the stimulus exposure duration. Consistent bisensory facilitation effects were noted for later trials, with interference evident on earlier trials. Exposure duration influenced rate and not amount of learning, with bisensory performance being most affected by duration. A transfer paradigm was used in Exp III, and little if any transfer was noted between unisensory and bisensory stimulus conditions. It is concluded that Ss were extracting the most salient bisensory stimulus components from the auditory and visual modes of information into a unidimensional information configuration.—*Journal abstract*.

8783. Johnson, Richard K. & Meyer, Robert G. (U Louisville) The locus of control construct in EEG alpha rhythm feedback. *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 913.—Investigated locus of control and performance in a biofeedback situation where the goal was to increase EEG alpha rhythms using 24 female Ss. Ss with an internal locus of control were better able to use feedback to increase

alpha activity than external Ss. Data indicate that definitions of environment should not stop at a person's skin but should also include internal processes and functioning.

8784. Jones, James M. (U Northern Iowa) Effects of ego-involvement and information level on own-categories responses. *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 293-294.—Results from college-student Ss support the prediction that increases in information would result in increases in the number of categories used in judging a stimulus domain; the prediction that increases in ego-involvement would result in decreases in the number of categories was not supported.

8785. Latham, Gary P. & Beach, H. D. (Weyerhaeuser Co, Human Resource Research, Tacoma, WA) Awareness in the conditioning and extinction of the galvanic skin response. *Psychological Record*, 1974(Fal), Vol 24(4), 497-505.—Studied the effects of awareness-una-wareness of stimulus relationships in a conditioned discrimination task using 2 tones as the stimuli (conditioned stimulus—CS), electric shock as the unconditioned stimulus (UCS), and galvanic skin response as the unconditioned response. 10 male undergraduates were given an attention-demanding masking task, and 10 others were given the same masking task but were told that the UCS followed only 1 of 2 tones. Both groups could verbalize the CS-UCS relationship, but discrimination learning occurred much more rapidly in the informed than in the uninformed group. Contrary to the hypothesis, discrimination learning extinguished more rapidly in the uninformed group.—*Journal abstract*.

8786. Leva, Richard A. (State University Coll New York, Fredonia) Modification of hypnotic susceptibility through audio-tape relaxation training: Preliminary report. *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 872-874.—Suggests that audio-taped deep-muscle relaxation training may be a useful device for improving hypnotic performance. 12 moderately susceptible undergraduates improved significantly on the Harvard Group Scale on Hypnotic Susceptibility after 3 training sessions. The technique may improve hypnotic performance of Ss low in susceptibility.

8787. Levine, Michael V. (U Pennsylvania) The generalization function is determined by one subject's probability learning data. *Journal of Mathematical Psychology*, 1974(Aug), Vol 11(3), 245-258.—In his review of probability learning, W. K. Estes (1972) notes that "the chief limitation on effective application" of the models for learning with a continuum of responses to have emerged from the linear and pattern learning models is the failure to specify the smearing or generalization function. He notes that "a useful technique has been developed by Levine for estimating this function from individual data." The present paper describes, gives the rationale for, and proves the validity of the previously unpublished technique.—*Journal abstract*.

8788. Majeres, Raymond L. (Western Illinois U) Cognitive styles and learning strategies in paired-associate learning. *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 861-862.—Studied paired-associate learning strategy and performance of 96 undergraduates with high and low Stroop Color-Word Test color-word ratios

under different motivation and learning conditions. There was a significant relationship between task, strategy (e.g., repetition, mnemonic device, or general systematic schemes), and cognitive style ( $p < .01$ ), though no relationships with performance were found. Results indicate that strategy may be less dependent on specific task demands than performance.—*Journal abstract.*

8789. McFarland, Carl E.; Kellas, George; Klueger, Kurt & Juola, James F. (U Kansas) **Category similarity, instance dominance, and categorization time.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Dec), Vol 13(6), 698-708.—Conducted an experiment requiring Ss to indicate whether or not a probe word belonged to 1 of a variable number of categories which were held in memory. Ss were 21 right-handed female undergraduates. The semantic similarity among the categories was varied, as was the instance dominance of the probe word. Comanipulation of these factors was expected to determine whether category similarity affects between-category shift or within-category search. However, the data suggest that category similarity and instance dominance are additive factors. Instance dominance apparently affected the time to encode the stimulus word and possibly influenced a decision stage; whereas, category similarity ostensibly affected operations involved in the search stage of processing. Semantically similar categories required less search time than semantically dissimilar categories. It is suggested that while dissimilar categories had to be accessed successively prior to search, Ss were able to consolidate similar categories so that categories were simultaneously accessed and searched in parallel. (17 ref)—*Journal abstract.*

8790. Owens, Jerry M.; Werder, Pamela R. & Marshall, Philip H. (US Naval Aerospace Medical Research Lab, Pensacola, FL) **A component analysis of natural language mediators obtained in paired-associate learning.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 512-514.—Analyzed the structural relationships between paired-associate components and natural language mediators (NLMs) by using forward and backward recall paradigms. 86 undergraduates were required to give the NLM and the appropriate to-be-recalled component for pairs learned by natural language mediation. An insignificant difference was found in the ability of stimulus and response components to elicit NLMs, but a significant difference was obtained in the ability to decode the NLM into the correct response, with the forward recall procedure resulting in more efficient response recall. Results are discussed in terms of differential elaboration of stimulus and response components.—*Journal abstract.*

8791. Parish, Thomas S. (Oklahoma State U) **Conditioning of racial attitudes and color concepts in children.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 707-714.—Determined whether attitudes of kindergarten children could be modified through classical conditioning procedures. 105 Ss in Exp I were asked to evaluate Negroes following exposure to the conditioning procedures, while 60 Ss in Exps II and III were asked to evaluate the color black and black animals, respectively, following exposure to the conditioning procedures.

Attitudes were measured with the T. Parish revision (1962) of the Preschool Racial Attitude Measure II. Only the experimental Ss in the latter 2 experiments adopted significantly more favorable attitudes toward the objects in question than their control counterparts. It appears that, while there were a sufficient number of conditioning trials to change attitudes of kindergarten children toward the color black and black animals, there were not enough conditioning trials to change their attitudes toward Negroes. (34 ref)—*Journal abstract.*

8792. Pishkin, Vladimir; Bourne, Lyle E. & Fishkin, Steven M. (VA Hosp, Oklahoma City, OK) **Task structure variables affecting concept identification.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 493-495.—In an experiment with 252 female undergraduates, a mismatch between the number of values of the relevant and the irrelevant dimensions (when there was more than 1 irrelevant dimension) in a stimulus population enhanced concept identification, probably because of a stimulus isolation effect. A mismatch between the number of values of the relevant dimension and the number of response categories, producing a form of stimulus-response incompatibility, inhibited performance. Attentional and hypothesis testing processes appear to underlie both of these effects.—*Journal abstract.*

8793. Richman, Charles L. & Lorenc, Leon. (Wake Forest U) **Effects of overtraining on reversal and half-reversal shift performance employing aural stimuli.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 503-504.—Investigated the relationship between extent of preshift training and type of shift using nonsense sounds as stimuli. 40 undergraduates listened to 4 runs of 5 notes each in a  $2 \times 2$  experimental design with 2 types of shift (reversal or half-reversal) and 2 levels of training (criterion—1 perfect trial, and overtraining—3 consecutive perfect trials). Overtraining facilitated reversal but not half-reversal shift performance. Results confirm previous findings using visual stimuli.—*L. Gorsey.*

8794. Schaeffer, Robert W. & Nolan, Robert J. (Auburn U) **Verbal learning and reinforcement: A reexamination of the Premack hypothesis.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 431-433.—Replicated R. McIntire's study (see PA, Vol 38:1991) which purportedly tested and confirmed the applicability of the Premack principle to verbal learning. 90 undergraduate Ss learned paired associate (PA) lists (comprised of words of intermediate response probabilities) in which the response words were reinforced (i.e., immediately followed) by words of high, intermediate, or low probabilities. Word probabilities were obtained from 2 standard word count sources (the Thorndike-Lorge and the Kucera and Francis). As was anticipated, no differential effects of the probability of the "reinforcement" words were obtained, as measured by trials to criterion for learning the PA lists. The failure of this experiment to support this application of the Premack principle was attributed to inappropriate methodologies used in identifying word probabilities. An appropriate method for testing the Premack principle in a PA learning task is described.—*Journal abstract.*

8795. Singh, R. N. & Krishna, K. P. (Magadh U. Gaya Coll, India) **A comparative study of some personal variables and verbal reasoning.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 56-59.—Compared intragroup differences in the scores of 210 male and 90 female 10-20 yr old students on Singh's Verbal Reasoning Test (VRT) across the variables of sex, age, grade, faculty, inhabitation, socioeconomic status, and parental professions. High and low groups, constituted respectively by the upper 50% and the lower 50% of scores on VRT, were compared by chi-square analysis. VRT scores were significantly higher for higher grades than lower ones, for Science students than Arts students, and for urban environments than rural ones ( $P < .01$ ).—*B. Lindsey*.

8796. Slovic, Paul & Tversky, Amos. (Oregon Research Inst, Eugene) **Who accepts Savage's axiom?** *Behavioral Science*, 1974(Nov), Vol 19(6), 368-373.—Conducted 2 experiments of a total of 78 male college students to investigate the acceptability of a key axiom underlying expected utility theory—L. Savage's (1954) independence principle. Persistent violations of this axiom were observed, even after it was presented to Ss in a clear and presumably compelling fashion. The problem of distinguishing between rejection of a decision principle and failure to understand it is discussed.—*Journal abstract*.

8797. Stang, David J. (Queens Coll, City U New York) **Effects of "mere exposure" on learning and affect.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 7-12.—The mediating role of learning in the relationship between repeated exposure and affect was explored and supported in 3 experiments involving a total of 229 undergraduates. Both learning and affect measures behaved in essentially the same way as a function of exposure duration (Exps I and III), serial position (Exps I and II), rating delay (Exp I), and stimulus properties (Exp I). Results suggest learning may be intrinsically rewarding and clarify one of the mechanisms involved in the relationship between exposure frequency and affect, extending D. E. Berlyne's 2-factor theory of the effects of stimulus familiarity. (21 ref)—*Journal abstract*.

8798. Swenson, Richard G. & Thomas, R. Emerson. (Harvard U, Medical School, Boston) **Fixed and optional stopping models for two-choice discrimination times.** *Journal of Mathematical Psychology*, 1974(Aug), Vol 11(3), 213-236.—Several current models for choice- or discrimination-time experiments represent the stimulus as a sequence of independent and identically distributed observations. The present study develops and compares models based on 2 different stopping rules that an S might use to terminate his sampling process and convert his perceptual evidence into an observable response. The fixed and optional stopping rules yield different predicted forms for the speed-accuracy tradeoff function and for the relation between mean and variance of response times. These predictions are developed in the general case and then specialized for certain conditions of symmetry, so that the expressions are easier to apply and to compare between models. A later section considers how changes in stopping criteria affect predictions about mean response times for correct responses and errors, and

then uses these ideas to relate the optional stopping rule for the random-walk models to those of the accumulator models. Specialized models are considered for stimulus detection and intensity discrimination that assume Poisson-distributed sensory input. (36 ref)—*Journal abstract*.

8799. Taplin, John E. & Jeeves, Malcolm A. (Claremont Graduate School) **The effects of extended practice on concept identification.** *Journal of Structural Learning*, 1973, Vol 4(1), 85-102.—Examined the effects of extended practice on attribute identification problems involving the following conceptual rules: conjunction, inclusive disjunction, conditional, or biconditional. 48 undergraduates were each given a series of 25 problems on 1 of the rules (randomly determined) and then asked how they would approach another problem of the same type. Stimuli were 81 cards of geometric figures which represented combinations of 4 attributes and 3 values. Significant differences were found between performance on the 4 rules, with an order of difficulty consistent with predictions derived from ideal focusing strategies. It is noted that the principal factor determining success seemed to be the nature of the first positive instance.—*C. Wright*.

8800. Taub, Susan I. & Whitman, Thomas L. (Devereaux Foundation, Devon, PA) **Transfer of training after fading and standard discrimination training.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 799-806.—Used standard discrimination and fading techniques to teach 28 preschool children a 2-choice discrimination task in which their nondominant dimension (color or form) was relevant for solution. The fading group performed better than the standard discrimination group on both an initial and a later generalization-discrimination task. On the generalization task, the superiority of the fading technique was limited to form-dominant Ss. When retested for dimensional dominance after 1 wk, fading significantly decreased Ss' choices of their previously dominant dimensions, while the standard discrimination trained Ss showed no change in preference.—*Journal abstract*.

8801. Vernik, E. Yu. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[The formulation of formal and semantic models of a problem in the process of problem-solving.]** (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 54-64.—Studied the relationship between the formal and the semantic aspects of the problem-solving process, using 66 Ss in 4 series of experiments. An analysis of the Ss' written reports led to the conclusion that in solving physics problems Ss formulate mental models that serve different functions from the viewpoint of the relationship between the formal and the semantic components of thinking. These models reflect the content of the problem on different levels. They are also related to different degrees of formality in the solution obtained. The different approaches to the solution of the same problem show different relationships between the formal and the semantic components of thinking and result in qualitatively different solutions. In less-than-optimum solutions the dividing line between these components is quite clear. In better solutions of the same problems the

dividing line between formal and semantic components disappears. (19 ref)—*L. Zusne.*

8802. **Winnikamen, Fajda.** (U René Descartes, Paris, France) [Modalities of the activity of subjects during the acquisition of knowledge.] (Fren) *Monographies Françaises de Psychologie*, 1973, No 26, 118 p.—Investigated modalities of intellectual activity in the process of acquiring knowledge. In the 1st series of experiments, 89 male and 103 female 4th-grade secondary school students responded to questions while learning improved conceptual generalization and utilization of facts in new problem situations. Reorganization of concepts facilitated generalization of knowledge and solution of related new problems. Some of the results were replicated and further examined in another study using 98 male and 88 female students. Additional aspects of modalities of knowledge acquisition were investigated in 27 male and 31 female college students and 295 2nd-yr psychology students. Previous results were, in general, verified in the context of more complex mental activities. (90 ref)—*S. Slak.*

8803. **Wolfe, Mary L.** (U Delaware) **Subjective comparisons of objectively equal intervals between integers.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 915-918.—44 undergraduates made subjective comparisons of pairs of contiguous, arithmetically equal intervals between numbers using a modification of the method of triads. Multiples of 10 from 10 to 100, inclusive, were used to construct the triads. For every triad but one, the interval between the larger integers was more frequently judged smaller. Results are in accord with those of earlier studies suggesting that subjective number is a negatively accelerating function of its arithmetic counterpart.—*Journal abstract.*

8804. **Yaremko, R. M. & Werner, Mara.** (San Diego State U) **Cognitive conditioning: Imagined stimulus contiguity and the third interval conditional GSR.** *Pavlovian Journal of Biological Science*, 1974(Oct-Dec), Vol 9(4), 215-221.—Studied the effect of repeatedly imagining paired or unpaired conditioned stimuli (CS) and unconditioned stimuli (UCS) on the frequency of post-CS responses during real extinction. 4 groups of 10 Ss each received a model tone and shock. For 2 groups the stimuli were paired (delayed conditioning paradigm). For the others the stimuli were arranged in a long trace paradigm. Ss were then required to imagine receiving paired CS and UCS, or to imagine the events singly. 10 real tone extinction trials were then given. Groups which received delayed conditioning model stimuli were more responsive than trace groups, and groups which had imagined paired stimuli were more responsive than their unpaired controls. Cognitively oriented explanations of these findings are discussed. (15 ref)—*Journal abstract.*

#### Attention & Memory

8805. **Anderson, John R. & Reder, Lynne M.** (U Michigan) **Negative judgments in and about semantic memory.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Dec), Vol 13(6), 664-681.—Conducted 3 experiments to determine how Ss falsify statements like, "A collie is a cat." A total of 67 college students and other adults served as Ss. A multiple regression analysis was performed which used 23 variables to try to predict the

negative judgment times. It was found that the predictive variables were time to generate the superordinate of the instance (e.g., "dog"), time to falsify that the superordinate is the predicate (e.g., "A dog is a cat"), and time to encode the instance. This finding and others indicate that a prominent negation strategy is one in which the S generates the superset of an instance and falsifies that the superset is the predicate. Auxiliary regression analyses are also reported for other reaction time measures gathered in the experiments. It is argued that large-scale regression experiments are critical to the inferential logic of a semantic memory experiment. (22 ref)—*Journal abstract.*

8806. **Brée, David S.** (Graduate School of Management, Delft, Netherlands) **Understanding of structured problem solutions.** *Instructional Science*, 1975(Jan), Vol 3(4), 327-350.—Investigated how much structured material (e.g., sample solutions to problems) is understood, what is earmarked for storage, what remains stored, and how useful this is for recreating the problem's solution. Based on the assumption that "understanding" is the result of a cognitive process in which information about the material is stored in memory, 12 university students were required to think aloud as they were given 3 problem solutions—the solution of the "missionaries and cannibals" problem, a geometry proof, and a plan for another geometry proof. Each solution was presented step-by-step; immediately after understanding the solution, Ss were asked to recall the major points in the solution. One week later, Ss were asked to repeat these steps and reproduce the solution. Results suggest that the understanding process has some consistency across different tasks and that the kinds of points best retained were the context of the problem and subproblems within the solution. The importance of Ss' method for deciding when he understands is discussed. (20 ref)—*Journal abstract.*

8807. **Crovitz, Herbert F. & Schiffman, Harold.** (VA Hosp, Durham, NC) **Frequency of episodic memories as a function of their age.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 517-518.—Gave 98 undergraduates a list of 20 common English nouns. Ss were told to inspect each word until a specific episodic memory associated with it came to mind, and to write a few words to identify that memory. After finishing the list, they were asked to go back and to date the episodic memories as accurately as they could. The frequency of memories as a function of their age was log log linear, with the frequency inversely related to the age of memory.—*Journal abstract.*

8808. **Dornić, Stanislav & Stelmach, George E.** (U Stockholm, Inst of Applied Psychology, Sweden) **Arousal and recall in a simple motor task.** *Reports from the Institute of Applied Psychology, University of Stockholm*, 1974, No 47, 6 p.—Investigated whether arousal induced by white noise would affect short-term motor memory. 2 groups of 10 17-18 yr old students each were tested under either control or arousal conditions on a linear slide task. Each group participated in 2 sessions with 12 target locations presented within each session. There was a 10-min interval between sessions. Examination of recall errors for Session 1 revealed no differences between groups. For Session 2, constant error revealed

that performance in the arousal condition was significantly better than in the control condition. Results are discussed in terms of the role arousal plays in motor memory. (17 ref)—*Journal abstract.*

8809. Dornič, Stanislav; Sarnecki, Mikael M.; Larsson, Tore J. & Svensson, Jan C. (U Stockholm, Inst of Applied Psychology, Sweden) **Performance and perceived difficulty: The effect of noise and distraction.** *Reports from the Institute of Applied Psychology, University of Stockholm*, 1974, No 51, 7 p.—40 17-18 yr old high school students performed 4 attention tasks involving high information load under 3 conditions: (a) in quiet; (b) in irregular, high intensity nonverbal noise; and (c) under the distraction of a conversation. Ss were able to compensate for the disturbing influences in Conditions (b) and (c) so that there was virtually no difference in performance between the 3 conditions. However, the "subjective costs," as measured by perceived difficulty, showed considerable differences in effort necessary for the compensation. Perceived difficulty was much higher in noise than in quiet and still higher in the distraction condition. Clear-cut interindividual differences were found in perceived difficulty, indicating differences in stress tolerance.—*Journal abstract.*

8810. Dornič, Stanislav; Svensson, Jan Ch. & Sarnecki, Mikael M. (U Stockholm, Inst of Applied Psychology, Sweden) **Memory trace and expectancy in a recognition task.** *Reports from the Institute of Applied Psychology, University of Stockholm*, 1974, No 50, 7 p.—Conducted 2 experiments in which a total of 84 17-18 yr olds Ss were required to recognize a visual signal in a series of nonsignals. Signals were presented only in the 1st, shorter part of the session. In the 2nd part only nonsignals were presented, although Ss were instructed to report signals throughout the whole session. A high number of false alarms during the signal-free period was found, inversely related to the number of hits in the 1st part of the session. There was no significant decline in subjective confidence throughout the session. Results are interpreted as due to expectancy and to decreasing strength of the memory trace of the signal.—*Journal abstract.*

8811. Durham, Robert L. & Sestokas, Doris. (U Colorado, Colorado Springs) **Some problems with reaction time as a measure of memory search.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 489-492.—Previous studies of memory search, utilizing reaction time (RT) as an index of processing time, have indicated faster RTs for a probe stimulus which is present in memory set than for one which is absent. T. Dodson (1972) reported a crossover interaction involving RTs when Ss responded with dominant or nondominant hand to stimulus presence or absence, thus confounding the above mentioned main effect. The present study with 20 right- and 20 left-handed undergraduates replicated the interaction reported by Dodson utilizing a different RT measure on a task not involved with immediate memory search. One of 3 colors (red, green, or blue) was randomly designated the positive color in the experiment for each S. Since all 3 colors are assumed equally available in memory, differences in RTs may not be accounted for in terms of encoding strategies. Rather, they must be due to differences in response selection.

Results indicate that left-handed females' RTs accounted for the variance associated with this interaction. Results are discussed in terms of a response selection bias for left-handed Ss.—*Journal abstract.*

8812. Gale, Anthony; Jones, Dylan M. & Smallbone, Adrian. (U Wales Inst of Science & Technology, Cardiff) **Short term memory and the EEG.** *Nature*, 1974(Mar), Vol 248(5447), 439-440.—Studied the relationship between low levels of arousal as measured by the EEG and efficient short-term memory. EEGs of 32 Ss were monitored during the acquisition and immediate recall of 9-digit strings presented in the auditory mode. After an initial 2-min rest period, Ss each underwent 24 trials, for which instruction was minimal. The EEG was recorded, stored, and averaged, using low frequency analysis. Thus, the systematic changes which occur in the human central nervous system during acquisition of material to be-recalled, and the relationship between such changes to subsequent recall, were plotted. It was found that poor performance was consistently associated with increased EEG arousal, even to the extent of enabling prediction of recall error rate before the task proper. Possible interpretations of these results are suggested.—R. S. Albin.

8813. Gormly, John & Lalka, Joseph. (Rutgers State U, Rutgers Coll, New Brunswick) **Arousal and memory.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 486-488.—Attempted to determine whether the relationship between arousal and recall interval is sufficient to account for data on differential recall of arousing and nonarousing events. Similar studies allegedly support a Freudian model of unconsciously motivated repression. Skin conductance was continuously recorded while 96 undergraduates attempted tasks similar to those which appear in tests of intelligence. Ss attempted the tasks under 1 of 8 experimentally induced conditions designed to produce various levels of arousal. The experimental manipulations, which were intended to create arousal through varying amounts of threat to a person's self-esteem, were not successful in producing differential arousal in high and low threat conditions; all conditions were highly arousing to the Ss. Therefore, the design was not suitable for its intended purpose. There was, however, a significant and replicated relationship between the number of sessions of testing S agreed to attend and arousal across the temporal duration of the 1st session ( $p < .05$  for males and  $p < .01$  for females).—*Journal abstract.*

8814. Harris, Richard J. (Kansas State U) **Memory and comprehension of implications and inferences of complex sentences.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Dec), Vol 13(6), 626-637.—Examined the comprehension and memory of truth-value information about sentential complements of 8 classes of subject-complement verbs. 152 undergraduates heard a list of complex sentences, all containing complement sentences as objects of the main verbs (e.g., "Miss America said that she played the tuba"). They were asked, either at the end of the entire list (memory group) or after each complement sentence (comprehension group), to judge the complement sentence ("Miss American played the tuba") as true, false, or of indeterminate truth value. On sentences where the complement had no logically necessary truth

value, comprehension Ss typically judged the truth value indeterminate, while memory Ss typically judged it according to its invited inference. Results are interpreted in the context of an interactionist view of the higher mental processes, where distinctions between different types of stored semantic information are obscured in memory. (33 ref)—*Journal abstract*.

8815. Healy, Alice F. (Yale U) **Separating item from order information in short-term memory.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Dec), Vol 13(6), 644-655.—Conducted 2 experiments, with 48 young adults as Ss, to separate experimentally the processing of item and order information. Findings provide support for the notion that order and item errors are caused by 2 different processes. Bowed serial-position curves were found when only order information had to be learned, but not when only item information had to be learned. The extent to which Ss are limited to phonemic coding in short-term memory was also investigated, and evidence was found that Ss employed phonemic coding in the present situations even though it was an inefficient strategy.—*Journal abstract*.

8816. Kintz, B. L. (Western Washington State Coll) **Attention, short-term memory, and academic performance.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 459-461.—To evaluate the relationship between attention and academic performance, 132 novel Russian-letter trigrams were used as stimuli. Each was presented to 71 college students for 2 sec, then 1 of 132 response-recognition quadrigae of trigrams, containing the previously shown stimulus trigram and 3 foils, was shown for 2 sec. S's task was to choose the correct response trigram from among the quadriga. Large differences in performance occurred, depending upon which element of the trigram was varied in the response quadrigae. An interaction between the varying element in the trigram and the position of the particular trigram within the overall list also occurred. Correlations between performance on this task and the academic performance of the Ss were all essentially zero.—*Journal abstract*.

8817. Kolers, Paul A. & Ostry, David J. (U Toronto, Ontario, Canada) **Time course of loss of information regarding pattern analyzing operations.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Dec), Vol 13(6), 599-612.—Varied the time between initial reading and the subsequent test for recognition and assessed memory for different aspects of sentences as a function of that interval. Ss were 42 undergraduates. Intervals ranged from a few minutes to 32 days between 2 readings of sentences. On the 2nd reading the S classified the sentences (half of which were "new") according to whether he thought he had seen them before or not, and if they were "old," whether he thought they reappeared in the original typography or an alternate one. Results show that information about typography can be recovered for at least 32 days after initial reading. The argument is made that memory for sentences can occur in terms of the pattern analyzing activities used in their encoding. (19 ref)—*Journal abstract*.

8818. Krishna, K. P. & Ansari, Mahfooz A. (Jaggiwan Coll, Gaya, India) **A study of relation between immediate recall and perceptual speed.** *Journal of Psychological*

*Researches*, 1972(May), Vol 16(2), 62-63.—Sought a positive relationship between immediate recall and perceptual speed on the basis of the presumed speed orientation of both tasks. 100 unselected pre-university male college students were given the Perceptual Speed Test, and 25 Ss with high and 25 with low perceptual speed were chosen. Ss were exposed to an unfamiliar picture for 1 min, then tested on immediate reproduction. While the Ss with high perceptual speed had a higher mean reproduction than those with low perceptual speed, the difference was not significant. Hence the null hypothesis cannot be rejected.—*B. Lindsey*.

8819. Lachman, Roy; Shaffer, Juliet P. & Hennrikus, Deborah. (U Houston) **Language and cognition: Effects of stimulus codability, name-word frequency, and age of acquisition on lexical reaction time.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Dec), Vol 13(6), 613-625.—Notes that inter-S agreement on names (uncertainty) for pictures indexes codability of visual reality in a language community. The time it takes to access permanent memory and retrieve name-words for visual objects was measured by picture naming reaction time (RT), using 16 undergraduates as Ss. RT was influenced by 4 fundamental variables: the uncertainty-codability of the display, the frequency and age of acquisition of the lexical response, and the interval between occasions of picture naming; uncertainty, frequency, and acquisition age covary. An 8-variable regression model mapped the main processes in lexical retrieval. Effects of major variables were independent. RT increased with uncertainty in 2 nonlinear segments, with apparent algorithmic processing at low uncertainty and heuristic at high. It is concluded that individual differences reside primarily in RT level (intercepts) and minimally in functional relationships with independent variables. (18 ref)—*Journal abstract*.

8820. Lauer, Patricia A. (U Colorado) **Encoding specificity in the cued and free recall of categorically and alphabetically organized words.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 496-498.—60 undergraduates learned a 40-word list comprised of 5 words from each of 8 taxonomic categories and beginning with each of 8 initial letters. Words were presented for study either cued and blocked by initial letter or by taxonomic category or randomly presented without cues. Output was cued by initial letters, taxonomic categories, or neither, followed by a 2nd uncued recall test for all groups. Consistency of input organization and output cue facilitated both cued and uncued recall but produced a decrement in cued relative to uncued recall. With output cues inconsistent with input organization, however, uncued recall was higher than cued recall. Clustering on the uncued free recall was dependent on input organization and was positively correlated with recall if categoric, but negatively correlated if alphabetic. Results support an encoding specificity hypothesis.—*Journal abstract*.

8821. Moeser, Shannon D. (Memorial U Newfoundland, St John's, Canada) **Memory for meaning and wording in concrete and abstract sentences.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Dec), Vol 13(6), 682-697.—235 undergraduates were presented with sets of concrete and abstract sentences in a series of 5

experiments. It was found that in nearly all cases Ss were better at identifying both meaning and wording changes in concrete sentences, and Ss took significantly longer to encode and decode the abstract sentences. The results could not be explained in terms of either rated comprehension or lexical complexity. It is suggested that neither a dual-coding interpretation nor a semantic propositional coding model could adequately explain the results; thus an analogue semantic coding model is proposed. (24 ref)—*Journal abstract*.

8822. Parkinson, Stanley R.; Knight, Mark V.; DeMaio, Joseph C. & Connors, James F. (Arizona State U) **Channels and order of report in dichotic memory.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 235-241.—Conducted 3 experiments with a total of 80 undergraduates in which Ss received to-be-remembered sequences of 2, 3, or 4 simultaneous pairs of digits. Both digits of each pair were recorded by the same male speaker and both were presented binaurally, thus eliminating cues of spatial location and voice by which Ss could "channel" their reports. Results show that even in the absence of these stimulus channels, Ss reported the digits sequentially. High bias ratings in Exp I suggested the possibility that sequential reports were induced by uncontrolled stimulus characteristics (e.g., temporal synchrony, intensity, and pitch). Pulse-coded speech stimuli, which provided greater control over nonlinguistic stimulus features, were used in Exp III. Bias ratings were reduced, but the majority of Ss continued to report sequentially. These results suggest that the presence of stimulus channels is not a necessary condition for the occurrence of sequential reporting.—*Journal abstract*.

8823. Penney, Catherine G. (Memorial U Newfoundland, St John's, Canada) **Modality effects in short-term verbal memory.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 68-84.—Argues that for short-term memory, auditory presentation is consistently superior to visual presentation, with the difference restricted to recently presented items. A review of the literature indicates that recall increases with fast presentation rates when auditory presentation is used in a serial recall task; otherwise, recall decreases as presentation rate increases. Some puzzling findings on dichotic and bisensory split-span memory are shown to be related to aspects of the modality difference, notably the strong sequential associations in auditory memory. (116 ref)—*Journal abstract*.

8824. Phillips, W. A. (Stirling U, Scotland) **On the distinction between sensory storage and short-term visual memory.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 283-290.—Conducted 3 experiments with a total of 16 university staff and students to study the effects of pattern complexity, pattern movement, and effects of pattern masking over a range of interstimulus intervals. A pattern made by randomly filling cells in a square matrix was presented for 1 sec and followed, after various intervals, by an identical or similar pattern. Ss responded "same" or "different." Performance was fast and accurate if the interval was short and there was no movement or masking of the pattern during the interval. Performance was slower, less accurate, and highly dependent on pattern complexity if the interval exceeded 100 msec, or if there was movement or masking. Results

are interpreted as evidence for 2 distinct classes of visual memory—high-capacity sensory storage which is tied to spatial position and is maskable and brief; and schematic short-term visual memory which is not tied to spatial position, which is protected against masking, and which becomes less effective over the 1st few seconds but not over the 1st 600 msec. (30 ref)—*Journal abstract*.

8825. Rowe, Edward J. (Memorial U Newfoundland, St John's, Canada) **Depth of processing in a frequency judgment task.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Dec), Vol 13(6), 638-643.—Examined, in 2 experiments, the effect of depth of processing on frequency judgments. In Exp I, using 28 undergraduates as Ss, situational frequency judgments were obtained for words presented in either the same or a different type of print on each repetition. In contrast with previous findings showing a large effect on frequency judgments of variation in word meaning, orthographic variation produced no effect, suggesting that the representation of situational frequency involves semantic encoding but is relatively insensitive to changes in nonsemantic attributes. Exp II, with 28 undergraduates as Ss, used an incidental learning paradigm to compare frequency judgments as a function of semantic vs nonsemantic levels of processing. Results suggest that frequency judgments are dependent on the level of processing activated by the presented words. (17 ref)—*Journal abstract*.

8826. Rundus, Dewey. (U South Florida) **Output order and rehearsal in multi-trial free recall.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Dec), Vol 13(6), 656-663.—Collected overt rehearsal protocols in a multitrial free recall task. Ss were 19 college-age females. The relationships between rehearsal and serial position showed only minor changes over trials. The probability of recalling an item was observed to be positively correlated with the amount of rehearsal of the item on all trials. The PRNI (priority in recall of newly recalled items) effect was observed and explained as resulting from a subject-strategy of giving additional rehearsal emphasis to some of those items which had not been recalled on the preceding test. Thus, the PRNI effect was seen as consistent with a general tendency for Ss to recall items in order of strength from strongest to weakest. (17 ref)—*Journal abstract*.

8827. Steimach, George E. & Dornič, Stanislav. (U Wisconsin, School of Education, Madison) **Retention of passive movement as a function of attention and recall delay.** *Reports from the Institute of Applied Psychology, University of Stockholm*, 1974, No 48, 4 p.—Used a simple immediate-memory paradigm with 20 17-18 yr old students whose task was to recall a passive horizontal movement of varying amplitude after 0-, 3-, and 7-sec intervals. The task was carried out under 2 conditions. In 1 condition, movements to be reproduced were presented while the Ss performed an attention task with high information load. In the 2nd condition, Ss were asked to fully concentrate on the motor task. Inspection of the absolute error revealed that in the 1st condition, performance was markedly worse and, in addition, there was a significant interval effect. Results support the view that attention plays a major role in short-term motor memory.—*Journal abstract*.

8828. Storandt, Martha. (Washington U) **Recognition across visual fields with mirror-image stimuli.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 762.—26 Ss' recognition of mirror-image reversals of complex, novel stimuli was significantly poorer when the presentation was to the hemisphere contralateral to that in which the stimuli were originally viewed. The suggestion that transfer across the corpus callosum is achieved in humans by point-for-point connections was not supported.

8829. Thackray, Richard L.; Jones, Karen N. & Touchstone, Robert M. (FAA Civil Aeromedical Inst, Aviation Psychology Lab, Oklahoma City, OK) **Personality and physiological correlates of performance decrement on a monotonous task requiring sustained attention.** *British Journal of Psychology*, 1974(Aug), Vol 65(3), 351-358.—Used a serial-reaction task to study personality, as well as physiological, correlates of individual differences in performance decrement under low task-load conditions. 60 male college students performed the task continuously for 40 min. Extraverted Ss (as determined by scores on the Eysenck Personality Inventory) showed increasing lapses of attention, while introverted Ss failed to show any evidence of a decline in attention. Of the 2 extraversion components (impulsivity and sociability), impulsivity was the component responsible for the obtained decrement. Heart-rate variability showed significant relationships with personality and with performance decrement, while mean heart rate did not. (18 ref)—*Journal abstract*.

8830. Warm, Joel S.; Epps, Billy D. & Ferguson, Robert P. (U Cincinnati) **Effects of knowledge of results and signal regularity on vigilance performance.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-A), 272-274.—Conducted a study of 72 undergraduates to examine the effects of true and false (noncontingent) knowledge of results (KR) within the context of temporally regular and irregular signal schedules. Ss listened for increments in the duration of recurrent white-noise pulses during a 1-hr vigil. Response times (RTs) to signal detections were faster and less variable when signals were presented on a regular as compared to an irregular basis. RTs were also faster and less variable for Ss receiving true or false KR relative to controls who experienced no feedback. However, the facilitative effects of true KR did not exceed those of false KR even when signal presentations were regular in time and apparently predictable. Results are considered as contrary to an expectancy interpretation of the role of KR in the vigilance task.—*Journal abstract*.

8831. Woods, Robert T. & Piercy, Malcolm. (U Cambridge, England) **A similarity between amnesic memory and normal forgetting.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 437-445.—E. K. Warrington and L. Weiskrantz (see PA, Vol 46:3574) reported a significant interaction between method of testing and S group when amnesics' and controls' memory was tested after a 1-min retention interval. A successful attempt was made to duplicate this finding without using amnesic Ss but substituting for them a group of normal college students with a presumably weak memory trace and comparing them with a group of normal Ss with a presumably strong memory trace. Each S learned a list of 100 words

and was then tested on half the words after 1 min and on the other half after 1 wk. A separate group of 6 Ss was used for each of the following methods of testing: yes-no recognition, cuing with initial letters, and cuing with a fragmented form of the words. The interaction between method of testing and retention interval was significant. Normal performance on yes-no recognition at 1 wk was (like amnesic performance) significantly inferior to normal performance at 1 min, and normal performance on each of the methods of partial information at 1 wk (like amnesic performance) did not differ significantly from normal performance at 1 min. It is concluded that Warrington and Weiskrantz's experiment can no longer be regarded as providing support for the theory that the amnesic syndrome is limited to a defect of retrieval. (French & German summaries)—*Journal abstract*.

### Motivation & Emotion

8832. Aminov, N. A. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[Functional states during monotonous work and the balance of the basic nervous processes.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 77-83.—Studied the effect of monotony on work performance. 40 Ss 17-28 yrs old were given the task of measuring the areas of a large number of circles, and their EEG, galvanic skin response (GSR), and number of errors were recorded. Ss could be divided into 2 groups on the basis of their alpha frequencies and alpha-wave energy: those with a predominance of nervous excitation and those with predominant inhibitory processes. Changes in the GSR level as a function of time spent at the task were of 4 types: increasing, decreasing, U-shaped, and fluctuating. Ss in whom skin resistance increased or followed a U-shaped function showed the largest number of errors. Ss showing a moderate level of arousal demonstrated little decrement in performance; Ss with a low level of arousal and a predominance of inhibition showed impaired performance as the task continued, as did Ss with a high level of arousal and the predominance of excitatory processes. (English summary) (18 ref)—*L. Zusne*.

8833. Basarov, B. (USSR Academy of Sciences, Inst of Psychology, Moscow) **[Experimental determination of the predominant motives in students.]** (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 150-151.—Describes a method whereby the S's perception of the length of parallel lines in different versions of the Müller-Lyer illusion is related to his motivation to obtain a prize for himself or for the group of which he is a member.

8834. Calder, Bobby J. & Staw, Barry M. (U Illinois, Organizational Behavior Program) **Interaction of intrinsic and extrinsic motivation: Some methodological notes.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 76-80.—R. deCharms (1968) has hypothesized that increasing extrinsic rewards may lead individuals to perceive their behavior as under the control of the rewards and that this, in turn, may reduce their intrinsic motivation. Recently, E. L. Deci has reported several studies dealing with this interaction between intrinsic and extrinsic motivation (e.g., see PA, Vol 46:2190). A number of methodological problems with Deci's experiments are discussed. Support for

deCharms's hypothesis is critically reviewed in order to direct future research.—*Journal abstract.*

8835. Deci, Edward L.; Cascio, Wayne F. & Krusell, Judith. (U Rochester) **Cognitive evaluation theory and some comments on the Calder and Staw critique.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 81-85.—In criticizing the authors' work about the effects of extrinsic rewards on intrinsic motivation, B. J. Calder and B. M. Staw (see PA, Vol 53:Issue 5) point out that additional data are necessary to substantiate several assertions. Those data are presented here, and they are seen to be consistent with earlier findings. Other criticisms are considered within the context of cognitive evaluation theory, and areas are pointed out where additional research is necessary.—*Journal abstract.*

8836. Galbraith, Gary G. & Sturke, Robert W. (Washington State U) **Effects of stimulus sexuality, order of presentation, and sex guilt on free associative latencies.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 828-832.—Studied the free associative latencies of 56 high- and low-sex-guilt male undergraduates (classified by scores on the Mosher Forced-Choice Guilt Inventory) on a set of stimulus words graded along a dimension of sexuality that were presented in either a descending or ascending order. The descending order of presentation began with high-sexuality words, progressed through moderately sexual words, and ended with asexual words. The ascending order began with low-sexuality words and ended with highly sexual words. High- and low-sex-guilt Ss differed significantly on highly sexual stimulus words, with low-guilt Ss exhibiting longer latencies. The sexuality of the stimulus words had a strong effect upon latencies, with the longest latencies occurring on highly sexual words. There was also a significant Stimulus Sexuality  $\times$  Order of Presentation interaction.—*Journal abstract.*

8837. Gorman, Bernard S. & Crain, William C. (City Coll, City U New York) **Decoding of "sentograms."** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 784-786.—Studied the ability of 43 undergraduates to decode "sentograms," a form of graphic expression of emotions discussed by M. Clynes (1972). Ss could decode sentograms at better than chance levels. However, accuracy in matching sentograms to labels of specific emotions was considerably worse than in matching sentograms to broader categories of affects.—*Journal abstract.*

8838. Harvey, John H. & Harris, Ben. (Vanderbilt U) **Determinants of perceived choice and the relationship between perceived choice and expectancy about feelings of internal control.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 101-106.—Tested the hypotheses that both perceived choice and expectancy about feelings of internal control over own behavior in a future situation will be greater (a) when a decision involves positive options than when it involves negative options and (b) that perceived choice will be greater when there is a small difference in attractiveness of the outcomes of the options than when there is a large difference. 80 undergraduates were asked to make a selection from 2 types of visual stimulation. Ss were led to believe that they would be exposed at a later time in the experiment to the type of stimulation they had

selected. Information about the types of stimulation was varied to manipulate valence of the outcomes of the options and difference in attractiveness of the outcomes of the options. Results support the hypothesis that both perceived choice and expectancy about feelings of internal control are greater when a decision involves positive options than when it involves negative options, and the predicted effect of difference in attractiveness on perceived choice when the decision involved positive options but not when it involved negative options. (15 ref)—*Journal abstract.*

8839. Hirschman, Richard. (Kent State U) **Cross-modal effects of anticipatory bogus heart rate feedback in a negative emotional context.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 13-19.—Studied the effect of altering the perceptions of one's own physiological arousal on the elicitation of emotional behavior as defined by galvanic skin response (GSR), the nonspecific GSR, and verbal report measures of discomfort and unpleasantness. After an initial 3-min rest period, 48 undergraduates were exposed to 10 successive slides of people who died violently, and to continuous auditory tones. The groups simultaneously exposed to the noxious slides and tones labeled as bogus heart-rate feedback responded to the slides with increased electrodermal activity as compared to Ss exposed to the identical auditory feedback labeled as extraneous noise. An increase in bogus heart rate tended to elicit the most pronounced electrodermal responses. As expected, bogus heart-rate conditions resulted in greater self-reports of discomfort and slide unpleasantness as compared to the noise conditions. Findings are explained as a function of a cyclic cognitive-visceral link. (16 ref)—*Journal abstract.*

8840. Klinger, Eric. (U Minnesota, Morris) **Consequences of commitment to and disengagement from incentives.** *Psychological Review*, 1975(Jan), Vol 82(1), 1-25.—Proposes an integrative theoretical framework for studying psychological aspects of incentive relationships. During the time that an incentive is behaviorally salient, an organism is especially responsive to incentive-related cues. This sustained sensitivity requires postulating a continuing state (denoted by a construct, current concern) with a definite onset (commitment) and offset (consummation or disengagement). Disengagement follows frustration, accompanies the behavioral process of extinction, and involves an incentive-disengagement cycle of invigoration, aggression, depression, and recovery. Depression is thus a normal part of disengagement that may be either adaptive or maladaptive for the individual but is probably adaptive for the species. Implications for motivation; etiology, symptomatology, and treatment of depression; drug use; and other social problem areas are discussed. (4½ p ref)—*Journal abstract.*

8841. Kruglova, N. F. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[The influence of the subjective hierarchy of activity elements on their preservation during a monotonous task.]** (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 75-84.—Measured the performance of 8 Ss in a number of monotonous, prolonged tasks. 3 measures of the primary elements of activity (e.g., errors) and 5 measures of secondary elements (e.g.,

the subjective estimation of fatigue) were taken. As the overall performance of the Ss deteriorated in the course of the task, the secondary elements of activity suffered most while the primary ones showed practically no deterioration. The deterioration of the secondary elements was a function of their importance to the S, of the degree to which he could effectively use feedback to monitor his own performance, and of his capacity for self-control and self-organization. (English summary)—*L. Zusne*.

8842. Luginbuhl, James E.; Crowe, Donald H. & Kahan, James P. (North Carolina State U, Raleigh) **Causal attributions for success and failure.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 36-93.—In 2 separate experiments with a total of 128 undergraduate Ss, attributions of success and failure experiences to the 4 factors of effort, ability, luck, and task difficulty were investigated. Results of both experiments confirm (a) a tendency to attribute success more than failure to internal factors and to unstable factors; (b) a strong interactive tendency to attribute success to effort as opposed to ability, but to attribute failure to lack of ability as opposed to lack of effort; and (c) no effect for a manipulation of expected difficulty of task.—*Journal abstract*.

8843. Machr, Martin L. (U Illinois) **Culture and achievement motivation.** *American Psychologist*, 1974(Dec), Vol 29(12), 887-896.—Analyzes 3 strategies for determining when and under what conditions persistence, choice, and variation in performance occur in the study of motivation. The 1st strategy relates to the role of personality in motivation. The 2nd strategy suggests that situational variables play a major role in achievement motivation, and the 3rd strategy specifically identifies both personality and situation as simultaneously critical variables in the analysis of achievement motivation. The study of cross-cultural motivation is discussed and an ethnographic approach is suggested, particularly in work with varied cultural groups. It is concluded that achievement and achievement motivation should be understood in terms of the sociocultural context in which they are found. (73 ref)—*A. de la Haba*.

8844. Manning, Sidney A. & Taylor, Dalmis A. (U Maryland) **Effects of viewed violence and aggression: Stimulation and catharsis.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 180-188.—Compared 2 types of response measures—aggressive and hostile responses—under conditions of instigation vs no instigation and aggressive vs neutral film. It was hypothesized that viewing an aggressive film would lead to a decrease in hostile responses (catharsis) and an increase in aggressive responses (stimulation) when compared with a neutral film condition. It was also hypothesized that both stimulation and catharsis effects would be enhanced under instigation conditions. Data from 80 male undergraduates show that Ss in the instigation condition had higher scores than those in the noninstigated condition. Ss in the aggressive film condition had lower scores than Ss in the neutral film condition. A significant Film  $\times$  Response Outlet interaction was found which offered support for the predicted catharsis effect on the hostility measure. There was no

support for the predicted stimulation effect on the aggression measure. (23 ref)—*Journal abstract*.

8845. Manning, Susan K. & Melchiori, Maria P. (Hunter Coll, City U New York) **Words that upset urban college students: Measured with GSRs and rating scales.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 305-306.—A study of college students indicates that while taboo words led to greater galvanic skin responses (GSRs) than violence, social and political, and illness words, these last also elicited GSRs.

8846. Ol'shannikova, A. E. & Rabinovich, L. A. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **A study of some individual characteristics of emotionality.** (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 65-74.—Studied the constellations and relative predominance of joy, fear, and anger. Ss' replies to questionnaires were scaled by the E. Their behavior in everyday situations was judged by personal acquaintances of the Ss who had been selected by them. The judges pair-compared all Ss on the presence of the 3 emotions. 8 qualitative modal structures of emotionality were identified in terms of the typical relative predominance of the 3 emotions. It is hypothesized that the stability of an individual's emotional characteristics is indicated to a significant degree by the balance among the different emotions that is typical for this individual. (English summary) (35 ref)—*L. Zusne*.

8847. Peretti, Peter O. (Kennedy-King Coll, Chicago, IL) **Color-mood associations in young adults.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 715-718.—200 undergraduates from psychology classes and 200 from English classes read excerpts from either a Shakespearean comedy or tragedy. Ss then recorded 1 of 3 colors (blue, yellow, or gray) which best reflected their mood after reading the excerpt. Significant sex and discipline differences were found, with males from both disciplines selecting yellow more frequently than would be expected when reading the tragedy. Females reading the tragedy, from both disciplines, selected blue more often than males, and females from English classes had fewer yellow choices than females from psychology classes. Results show that color-mood associations do exist in young adults of college age.—*L. Gorsev*.

8848. Pollio, Howard R. & Mers, Rodney W. (U Tennessee) **Predictability and the appreciation of comedy.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-A), 229-232.—Conducted a study of 44 undergraduates to investigate the role of joke predictability in humor appreciation. Ss were asked to provide punch lines for in-concert routines performed by 2 comedians. Predictability scores derived from each of these routines were then related to various measures of audience laughter produced in response to these routines. Results show no difference in predictability of punch lines and non-punch lines, and strong positive correlations between predictability and the various indices of audience responsivity.—*Journal abstract*.

8849. Rosenthal, Bernard G. (Illinois Inst of Technology) **The psychology of compassion.** *Human Context*, 1972(Fal), Vol 4(3), 600-607.—Derives from phenomenological analysis the categories of compassionate experience, describes the subjective emotional and

cognitive concomitants, and points out the influence of the sociocultural context.

8850. Rudashevskii, V. D. (USSR Academy of Sciences, Scientific Research Inst of Sociological Research, Moscow) [Risk, conflict and uncertainty in the process of decision-making, and their modelling.] (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 84-94. —Reviews decision-making theory, with emphasis on the role of risk, conflict, and uncertainty. Risk is defined as the likelihood of error in making a choice among alternative courses of action, conflict as the incompatibility of the alternatives of choice, and uncertainty as the absence of decisive information. It is suggested that uncertainty has 2 components, one associated with risk, the other with conflict. A small-scale pilot study of a simulated game is described in which risk, conflict, and uncertainty were measured using mathematical models. The predicted nonlinear relationship among these 3 variables was confirmed. (English summary) (25 ref)—*L. Zusne*.

8851. Siegel, Larry J.; Sullivan, Dennis C. & Greene, Jack R. (Northeastern U, Coll of Criminal Justice) Decision games applied to police decision making: An exploratory study of information usage. *Journal of Criminal Justice*, 1974(Sum), Vol 2(2), 131-146. —Analyzed police decision-making processes using L. T. Wilkins's 1965 decision board technique. This method assumes that decision-making can be measured by observing S's response to stimuli presented in the form of pieces of information. A board was created and employed with 50 municipal police officers. Findings suggest that police demonstrate individualized preferences for varying amounts and kinds of information. The nature of the offense was considered most frequently. The attitude of the offender was also an important determinant of the decision outcome; the offender's attitude then influenced the amount and type of information subsequently used. (22 ref)—*Journal abstract*.

8852. Smith, Gene F. & Dorfman, Donald D. (Western Illinois U) The effect of stimulus uncertainty on the relationship between frequency of exposure and liking. *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 150-155. —Determined whether the relationship between frequency of stimulus exposure and affective ratings depends on the uncertainty of the stimuli involved. It was assumed that Ss prefer stimuli of an intermediate uncertainty (or complexity) level and that increasing the frequency of exposure of a stimulus reduces the uncertainty elicited by the stimulus. These assumptions led to the prediction of an Exposure Frequency  $\times$  Stimulus Uncertainty interaction which was supported by data from 300 male undergraduates. For low-uncertainty stimuli, liking decreased as frequency increased. For high-uncertainty stimuli, liking increased as frequency increased. For stimuli of an intermediate uncertainty level, liking first increased and then decreased as a function of exposure. Results are interpreted in information-theoretic terms. (23 ref)—*Journal abstract*.

8853. Terry, Roger L. & Lindsay, Diane. (Hanover Coll) Expectancy confirmation and affectivity: A role playing variation. *Psychological Record*, 1974(Fal), Vol

24(4), 469-475. —Measured the affective reactions of persons to the confirmation and disconfirmation of their expectancies varying in strength and value. 25 female undergraduates role played in 8 situations created by the orthogonal arrangement of dichotomized variables of expectancy outcome, strength, and value. Results confirm earlier findings obtained by laboratory experimental manipulations involving deception. Thus transmethodological generality is given to the conclusion that the affect generated by confirmation (disconfirmation) is directly (inversely) related to the strength and/or value of the held expectancy. (20 ref)—*Journal abstract*.

8854. Terry, Roger L. (Hanover Coll) Role playing and the effects of expectancy confirmation. *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 291-292. —Results of a test of 25 undergraduate females indicate that (a) greater positive effect was generated by confirmation than by disconfirmation and (b) the positive affect generated by confirmation or disconfirmation was directly or inversely related to expectancy strength and value.

8855. Weintraub, Marcy; Segal, Richard M. & Beck, Aaron T. (U Michigan) An investigation of cognition and affect in the depressive experiences of normal men. *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 911. —Administered the Depression Adjective Check List and a projective story completion test as measures of depression to 30 male undergraduates 5 times over a 2-mo period. Data demonstrate the existence of a unified, negative content that is associated with depressed mood among normal Ss and suggest a similarity in the depressive processes of pathological depression and depressed mood.

## NEUROLOGY AND PHYSIOLOGY

8856. Ferchmin, P. A.; Bennett, Edward L. & Rosenzweig, Mark R. (U California, Berkeley) Direct contact with enriched environment is required to alter cerebral weights in rats. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 360-367. —To test the relative effectiveness of direct vs indirect interaction with an enriched environment, 2 experiments were conducted with Berkeley Ss, rats. Some Ss were housed in groups of 12 in large enriched condition (EC) cages while littermate "observer" (OC) Ss were placed singly in small wire-mesh cages within EC. A 3rd group was housed singly in an impoverished condition (IC) where stimulation was minimal. After 30 days, Ss were killed and the brains dissected. In both experiments the usual pattern of EC-IC differences in brain weights appeared, whereas OC showed no significant differences from IC. On measures of exploratory behavior taken during the last 2 days of Exp II, IC fell significantly below EC, and OC was somewhat below IC. Thus EC differed from both IC and OC in brain and in behavior. Active contact with an enriched environment appears necessary for development of EC effects. (35 ref)—*Journal abstract*.

8857. Hirsh, Richard. (California Inst of Technology) The hippocampus and contextual retrieval of information from memory: A theory. *Behavioral Biology*,

1974(Dec), Vol 12(4), 421-444.—Advances a theory which holds that information is normally stored within a specialized memory rather than the system immediately responsible for the performance of behavior. The transfer of information from storage to the system immediately responsible for performance, according to the theory, can occur independently of the occurrence of external stimuli. Usually such information transfer would be prompted by motivational cues and always result in anticipation of stimuli. The hippocampus is regarded as part of a system responsible for determining which information is to be transferred from storage to the performance system. The effects of hippocampal ablation are explained in terms of the elimination of such transfer. A subsidiary system relying upon habit formation is held to be responsible for the learning of which hippocampally ablated animals are capable. (4 p ref) —*Journal abstract.*

8858. Suzdaleva, V. A. & Chuprikova, N. I. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) [Speed parameters of associative responses and the typological properties of the human nervous system.] (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 137-144.—Studied the relationship between associative response times (RTs) in 17 tasks and several measures of the strength, lability, and mobility of the nervous system in 35 university students. Factor analysis of the RTs yielded a single factor. The intercorrelations among all measures yielded 2 factors. It is concluded that for each individual there is a characteristic associative RT that is a function of the lability of the nervous system. The mobility aspect of the functioning of the nervous system influences the RT of those associations that involve additional information processing and decision making. (29 ref)—*L. Zusne.*

8859. Vogt, Brent A. (Harvard Neurological Unit, Boston City Hosp, MA) A reduced silver stain for normal axons in the central nervous system. *Physiology & Behavior*, 1974(Dec), Vol 13(6), 837-840.—Describes a staining technique which impregnates nerve fibers with silver and then differentiates with a hematoxylin differentiator. The result is a simple and efficient stain which can be used to study normal fiber plexes with great clarity and to evaluate lesions in cortical fiber plexes and fiber tracts.

#### Neuroanatomy & Electrophysiology

8860. Barr, Murray L. (U Western Ontario, London, Canada) *The human nervous system: An anatomical viewpoint.* (2nd ed). New York, NY: Harper & Row, 1974. x, 408 p. \$12.95.—Focuses discussions of the anatomy of the central nervous system (CNS) on (a) neurohistology; (b) the regional anatomy of the CNS, beginning with the spinal cord and progressing to the highest levels of the brain; (c) the sensory and motor systems; and (d) the blood supply of the CNS, its meningeal coverings, and the cerebrospinal fluid.

8861. Ben-Ari, Yehezkel & Le Gal La Salle, Gildas. (CNRS, Lab de Physiologie nerveuse, Gif-sur-Yvette, France) Lateral amygdala unit activity: II. Habituating and non-habituating neurons. *Electroencephalography & Clinical Neurophysiology*, 1974(Nov), Vol 37(5), 463-472.

—Recorded unit activity from the lateral amygdala in 60 adult immobilized cats for prolonged periods during which habituation procedures were applied (somatic, auditory, and visual stimuli were used). A mean intertrial interval of 13 sec  $\pm$  7 sec was used. Changes induced by the procedure were consistently similar for a large number of units: either the response parameters, particularly the duration, decreased progressively (habituating—H units) or were unchanged (nonhabituating—NH units). The relationship between spontaneous and evoked activity described by Y. Ben-Ari et al (see PA, Vol 53:Issue 4) was used to differentiate H from NH units—H units had inhibitory responses most often, an initial long duration response and a low spontaneous frequency. NH units had excitatory short duration responses and a high spontaneous frequency. The spontaneous frequency which was initially low in H units progressively increased while it was stable for NH units. Differences between somatic and auditory response decrements are discussed in relation to dishabituation and transfer of habituation phenomena. (French summary) (17 ref)—*Journal summary.*

8862. Ben-Ari, Yehezkel; Le Gal La Salle, Gildas & Champagnat, Jean-Claude. (CNRS, Lab de Physiologie nerveuse, Gif-sur-Yvette, France) Lateral amygdala unit activity: I. Relationship between spontaneous and evoked activity. *Electroencephalography & Clinical Neurophysiology*, 1974(Nov), Vol 37(5), 449-461.—Recorded unit activity from the lateral amygdala in 60 locally anesthetized adult cats. Units were recorded from between .5 to 8 hrs, and both spontaneous and evoked discharges were recorded, along with EEG, hippocampal activity, and arterial blood pressure. Results show that (a) there was a high percentage of low firing rates, particularly in the central core of the nucleus; (b) somatic stimuli were more effective in evoking a response than were auditory or visual stimuli; (c) inhibitory responses were more frequent than excitatory or complex ones (i.e., excitation followed by inhibition or the reverse); (d) spontaneous rate of responsive units was higher than the nonresponsive ones; and (e) spontaneous rates were inversely proportional to response duration. The type of response was not changed although the firing rate may have been modified in relation to sleep-waking changes; however, the relation between firing and response duration was maintained. (French summary) (20 ref)—*Journal summary.*

8863. Bigler, Erin D. & Fleming, Donovan E. (Brigham Young U) Habituation and the occurrence of photically evoked afterdischarges in the albino rat. *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-A), 275-277.—Examined photically evoked afterdischarge (AD) parameters in 13 Holtzman albino rats during the time course of 1 hr of iterative photic stimulation (515 light flashes). It was observed that percentage of AD elicitation, duration of AD activity, and number of spindle waves per AD increased and then subsequently decreased over time. The amplitude of the largest peak-to-peak wave per AD was unaffected by time. Greatest AD elicitation took place during the 5- to 15-min time segment following the initiation of iterative photic stimulation. Likewise, the last 5 min of iterative stimulation yielded the lowest AD elicitation scores. It

was also observed that spontaneous AD-like waves occurred in the visual cortex at irregular intervals that were not specifically correlated with the light flashes. Data suggest the operation of an arousal continuum in the process of AD elicitation.—*Journal abstract.*

8864. Branchey, M.; Brebbia, D. R.; Kohn, M. & Litchfield, D. (Rockland State Hosp, Research Ctr, Orangeburg, NY) **Results of studies using an on-line automatic analyzer of sleep stages in the rat.** *Electroencephalography & Clinical Neurophysiology*, 1974(Nov), Vol 37(5), 501-506.—Reports results of studies using an on-line automatic analysis of polygraphic records in male Sprague-Dawley rats which distinguishes between waking (W), and REM and NREM sleep. 3 basic parameters, similar to those used in visual scoring of polygraphic records were used: a bifrontal electrocorticogram, a fronto-occipital electrocorticogram (which shows theta activity during REM), and nuchal electromyogram. The correspondence between visual and automatic scoring, based on 24-hr recordings of 5 different Ss, was as good as that obtained between different human scorers. The method described here appears to be particularly applicable for use in long-term sleep studies in the rat. (French summary)—*Journal summary.*

8865. Brown, H. R.; Andrianov, G. N. & Ilyinsky, O. B. (USSR Academy of Sciences, Pavlov Inst of Physiology, Leningrad) **Magnetic field perception by electroreceptors in Black Sea skates.** *Nature*, 1974(May), Vol 249(5453), 178-179.—Describes the method and results of assessing the magnetic perception of Black Sea skates who have electroreceptor apparatus. The experiments showed that the changing magnetic field penetrating the fish evoked the response of neurons in the area acoustico-lateralic, whereas the constant magnetic field failed to influence the electroreceptor system. Results are discussed in terms of the magnetic field of the earth and the fish movements that occur naturally.

8866. Buchsbaum, Monte; Coppola, Richard & Bittker, Thomas E. (NIMH Public Health Service, Bethesda, MD) **Differential effects of "congruence," stimulus meaning, and information on early and late components of the average evoked response.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 533-544.—Visual average evoked responses (AERs) were studied in situations where Ss expected after training that a different stimulus intensity would occur, or misperceived the actual intensity of the stimulus. In Exp I 15 paid female young adults were taught a simple temporal pattern of light intensities. After repeated presentation of a simple pattern of lights, Ss tended to view more complex patterns as if they were a continuation of the preceding simpler pattern. In Exp II with 36 young adult volunteers, when Ss erred in an absolute intensity judgment task, their AERs to the misperceived stimulus had an amplitude either larger or smaller depending on the direction of the S's error. This tendency to produce AERs consistent with what the S expected was reflected significantly in the early but not late components of the S's AER. Termed the "congruence illusion," the effect is hypothesized to be a means of protection against stimulus overload. The congruence illusion was eliminated by providing Ss with sufficient details of a complex pattern. Stimulus meaning effects

were reflected principally in early components, while information value and contrast effects were confined to later components. (French & German summaries) (22 ref)—*Journal abstract.*

8867. Carmeliet, J.; Debecker, J. & Demaret, P. (U Brussels, Brain Research Unit, Belgium) **A convenient stimulus and situation coding system for the tape recording of event-related potentials.** *Electroencephalography & Clinical Neurophysiology*, 1974(Nov), Vol 37(5), 516-517.—Describes a low-cost versatile electronic coding apparatus for tape-recorded psychophysiological experiments. The 1st circuit serves to encode, to record in AM mode on tape and to retrieve the occurrence in time of 4 independent sensory stimuli, using only 1 tape track. The 2nd circuit is used to write in FM mode on another tape track any figure from 1 to 9 characterizing as many experimental situations. (French summary)

8868. Christie, Margaret J. & Venables, P. H. **Change in palmar skin potential level during relaxation after stress.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 301-306.—A noise-avoidance task was used as a laboratory stressor, and rate of reduction in the negativity of palmar skin potential level (SPL) was used as an index of speed of relaxation. SPL was monitored from 12 male Ss during relaxation periods before and after the task, and compared with similar records from 12 control Ss who were not exposed to this stressor. The rate of reduction in negativity of poststressor SPL was significantly slower than in the prestressor condition; there was no such difference in the data from control Ss. Emotionally unstable introverts relaxed the slowest. (26 ref)—*W. G. Shipman.*

8869. Debecker, J. & Carmeliet, J. (U Brussels, Brain Research Unit, Belgium) **Automatic suppression of eye movement and muscle artifacts when averaging tape recorded cerebral evoked potentials.** *Electroencephalography & Clinical Neurophysiology*, 1974(Nov), Vol 37(5), 513-515.—Describes a method which allows the elimination of eye blinks and other artifacts from the evoked potentials averaged from tape-stored EEG data. Circuit diagrams and technical specifications for the method are presented. (French summary)

8870. Denisova, I. M. & Kosilov, S. A. (USSR Academy of Pedagogical Sciences, Inst of Child & Juvenile Physiology, Moscow) **[Bioelectrical processes in the cerebral cortex and antagonist muscles in dogs in the formation of precision movements.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 16-25.—Measured the bioelectrical activity of the cerebral cortex and the antagonist muscles of 3 dogs trained on a special stand to evoke precision movements. Bioelectrical activity reflected the periods of formation of the integral image of precision movement, corresponding to changes in mechanogram parameters in the process of movement elaboration. When the intensity of search increased, a diffused excitation process was observed in the cerebral cortex, and eventually an excitation irradiation in the motoneurons of the working muscles. At the end of search, the motoneurons and the cerebral cortex displayed a concentration of excitation. The integral image of precision movement corrects precision by 1 kinesthetic channel of information, but the change in one of the parameters of the effort of

movement requires an additional, visual channel of information.—*English abstract.*

8871. Džoljić, M. R.; Bonta, I. L. & Holten, C. V. Erasmus U, School of Medicine, Rotterdam, Netherlands) A method and its pharmacological application to determine the duration of arousal pattern based on amplitude changes of EEG signals in rats. *Experientia*, 1974, Vol 30(1), 117-119.

8872. Evarts, Edward V. (NIMH, Lab of Neurophysiology, Bethesda, MD) Brain mechanisms in motor control. *Life Sciences*, 1974(Oct), Vol 15(8), 1393-1399.—Discusses observations which have emerged as the result of techniques developed to allow individual neuron activity to be recorded in the course of normal movement in the monkey. Data thus obtained have been applied to study of the way information flows between the 3 major subsystems of the brain's motor control system: the cerebral motor cortex, the basal ganglia, and the cerebellum. The mechanism of action of each of these subsystems and their interrelationships in movement control are detailed from the literature. Implications for future research in psychology and psychiatry are suggested. (17 ref)—*B. McLean.*

8873. Fleming, Donovan E. & Bigler, Erin D. (Brigham Young U) Relationship between photically evoked after-discharge occurrence and hippocampal EEG rhythms in restrained and unrestrained albino rats. *Physiology & Behavior*, 1974(Dec), Vol 13(6), 757-761.—The relationship between photically evoked after-discharge (PhAD) occurrence and dorsal hippocampal EEG patterns was examined in 10 restrained and 10 unrestrained Holtzman albino rats during the presentation of 25 photic stimuli. Although the restrained and unrestrained conditions yielded significant differences in PhAD occurrence and type of hippocampal EEG pattern exhibited, it was determined that if the hippocampus displayed a rhythmic slow-wave activity (RSA or theta) PhADs were not elicited. These hippocampal RSA periods were highly correlated with grid activity in the unrestrained condition. PhADs were elicited only during hippocampal EEG episodes that could be characterized as either large- or small-amplitude irregular slow waves. (32 ref)—*Journal abstract.*

8874. Hill, R. M. & Ritchie, G. D. (Ohio State U, Coll of Optometry, Physiology Lab) Directional discrimination: Tolerance of visual cortical cells to severe stimulus degradation. *Experientia*, 1974, Vol 30(6), 628-629.—Investigated the vulnerability of the cortical cell's directionally selective response to severe forms of stimulus degradation. Nearly 300 observations were made of pigmented hybrid rabbits' responses to projected stimuli while under light urethane anesthesia. Microelectrodes were used to record data from the photically responsive cells of the contralateral visual cortex. Results indicate that the production of the maximum spike numbers was dependent on optimum focal conditioning, while preservation of the directionally selective property was independent of focal conditions. (German summary)—*R. Tomasko.*

stages in the rat. *Electroencephalography & Clinical Neurophysiology*, 1974(Nov), Vol 37(5), 518-520.

8876. Malmö, Robert B. & Mundl, William J. (McGill U, Allan Memorial Inst, Montreal, Quebec, Canada) Osmosensitive neurons in the rat's preoptic area: Medial-lateral comparison. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 161-175.—Conducted an experiment with 17 Charles River Long-Evans hooded rats in which, for the 1st time, brain-recording data were brought to bear directly on the question of a critical osmosensitive zone in the lateral preoptic area as specifically delimited in the rat by E. M. Blass and A. N. Epstein (see PA, Vol 47:2252) and in the rabbit by J. W. Peck and D. Novin (see PA, Vol 45:7490). The present data clearly show that this critical zone in the lateral preoptic area of the rat contains cells that are osmosensitive. Simultaneous recording from cell populations (a) inside the critical zone and (b) in a zone medial to it showed that the net acceleratory response to challenge for the former was much greater than it was for the latter. Findings constitute new evidence for the critical importance of the lateral preoptic area in cellular dehydration thirst. (47 ref)—*Journal abstract.*

8877. McFarland, Willard L.; Teitelbaum, Herman & Hedges, Elizabeth K. (NIH, Div of Research Grants, Bethesda, MD) Relationship between hippocampal theta activity and running speed in the rat. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 324-328.—The frequency of occurrence and amplitude of hippocampal theta waves induced by forced locomotion was proportional to speed of movement on a treadmill of 6 implanted male Sprague-Dawley rats. Although induction of hippocampal theta waves was related to the initiation of movement, it was not dependent upon proprioceptive feedback because it persisted in the resting S after a bout of running. It was possible to obtain cortical theta waves in the absence of hippocampal theta activity.—*Journal abstract.*

8878. Moneta, M. Eugenia; Lolas, Fernando & Pinto-Hamuy, Teresa. (U Chile, Santiago) Response variables and motor slow cortical potentials (SCP) during performance of learned movements in the squirrel monkey (*Saimiri sciureus*). *Neuropsychologia*, 1974(Oct), Vol 12(4), 477-485.—Studied the influence of response-dependent variables on SCP morphology to corroborate motor cortex contribution to SCP genesis. Electrical responses were recorded using nonpolarizable electrodes from motor cortex of 5 monkeys during performance of a learned appetitive instrumental upper-limb response under 2 different force ranges which were signaled by colored lights. SCP and force values were sampled and processed by means of a LINC computer. Data indicate that SCP recorded bilaterally from specific motor cortex were influenced by response-dependent variables: force exerted and duration of movement. This effect was especially clear over the hemisphere contralateral to the limb used. A possible relationship between response variables explored and SCP components is suggested. (French & German summaries) (33 ref)—*Journal abstract.*

8879. Mulroy, M. J.; Altmann, D. W.; Weiss, T. F. & Peake, W. T. (Massachusetts Eye & Ear Infirmary, Boston) Intracellular electric responses to sound in a

**vertebrate cochlea.** *Nature*, 1974(May), Vol 249(5456), 482-485.—Reports intracellular responses from single hair cells and supporting cells in the cochlea of the alligator lizard *Gerrhonotus multicarinatus*. Electric responses to sounds were of nearly the same magnitude in both hair cells and supporting cells, but the waveforms of the responses to clicks differed in these 2 types of cells. (27 ref)

(27 ref)  
8880. Nash, Allan & Singer, Jay J. (Florida Atlantic U) The late positive component of the auditory evoked potential in a shared reading and counting task. *Neuropsychologia*, 1974(Oct), Vol 12(4), 521-526.—Presented 8 male university student volunteers with a series of low and high tones. When they were instructed to ignore the tones and perform a reading task, the late positive component (LPC) of the evoked EEG was absent. Both tones, however, produced LPCs when S counted the higher tone, with the counted tone showing greater LPC amplitude. Under a shared reading and counting task, LPC amplitudes were reduced and comparable to those observed in the read-only condition. Results are interpreted as most consistent with a selective attention hypothesis of the LPC (French & German summaries)—*Journal abstract*.

8881. Oatman, Lynn C. & Marvel, Kenneth D. (US Army Human Engineering Lab, Aberdeen Proving Ground, MD) **Effect of click intensity on round-window potentials in cat.** *Journal of Auditory Research*, 1972(Jul), Vol 12(3), 208-211.—Re-examined cochlear microphonic (CM) and N<sub>1</sub> intensity functions for click stimuli. Ss were 4 anesthetized cats and 7 chronically-implanted, waking cats, all with middle ear muscles cut. Mean peak-to-peak amplitudes of the N<sub>1</sub> response indicated that the intensity function is not monotonic, but clearly shows a 2-stage growth. The 2 stages are separated by a plateau in the 75-95 db intensity range, although at these levels the CM intensity function is growing monotonically. Anesthetized Ss showed lower maximum outputs of both CM and N<sub>1</sub>.—*M. B. Meikle.*

and N<sub>1</sub>.—M. B. Meikle.

8882. Petsche, H. et al. (U Vienna, Neurophysiologisches Inst, Austria) **Cortical seizure patterns in multidimensional view: The information content of equipotential maps.** *Epilepsia*, 1974(Dec), Vol 15(4), 439-463. —Recorded seizure patterns elicited by penicillin, pentylenetetrazol, or electrical stimulation in curarized rabbits from 16 electrodes at 1- and 2-mm distances in a square grid. The potential fields were calculated and printed as equipotential maps every 2, 4, or 8 msec, and the paths of the positive and negative maxima of the fields were drawn. The positive potential fields usually moved in a preferred direction whereas the negative fields were stationary. The paths were seldom straight lines. Regularity of the EEG pattern appeared to be caused by potential fields that maintained their path of propagation. Potential gradients were steeper on the leading than on the trailing edges of the fields. At cytoarchitectonic borders the fields were often distorted or disappeared. Traveling waves were frequent and the equipotential lines usually elliptical in the direction of propagation. Since potential fields tend to follow the same path, they must leave a trail of facilitation, thus aiding the formation of "engrams." (French, Spanish, & German summaries) (23 ref)—*Journal summary.*

8883. Šušić, V.; Kovačević, R. & Knežević, S. (U Belgrade, Medical Faculty, Yugoslavia) **Restricted sleep regime: Effects on the occurrence of different sleep phases and spiking activity in the lateral geniculate nucleus.** *Experientia*, 1974, Vol 30(1), 42-43.—Examined the effects of reduced sleep time on the occurrence of ponto-geniculate-occipital spikes during and shortly preceding REM sleep. A treadmill was used to restrict the sleep periods of 4 adult cats to 8, 4, and 2 hrs. EEG, electromyogram, and electroculogram readings were continuously made. Results indicate that the reorganization of the sleep-waking profile, with reduced sleep, is in favor of REM sleep. The proportional increase of REM sleep was higher as sleep deprivation increased. Restricted sleep increased the spike density in slow-wave and REM sleep, with REM spike density showing little increase and slow-wave spike density showing considerable increase. (French summary)—*R. Tomasko.*

8884. Schweitzer, Paul K. & Tepas, Donald I. (St Louis U) **Intensity effects of the auditory evoked brain response to stimulus onset and cessation.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 396-400.—Average evoked brain responses (EBR) to the onset (ON) and cessation (OFF) of 1-kHz pure-tone stimuli were computed from 3 normally hearing, adult male human scalp recordings. Stimuli of 2,000-msec duration were presented binaurally at 10 intensity levels. Results show that the waveform of the OFF EBR was similar to the ON EBR. The ON response was in general larger than the OFF response. Comparable ON and OFF amplitude response measures were both sensitive to changes in stimulus intensity which were fitted by a linear function. Significant differences in slope between ON and OFF amplitude intensity functions were demonstrated, which suggests different physiological systems for these responses.—*Journal abstract.*

8885. Siddle, David A. (U Southampton, England) **Overextinction of the evoked skin conductance response: An EEG study.** *Psychophysiology*, 1974(Nov), Vol 11(6), 630-638.—Investigated Y. N. Sokolov's (1963) proposal that overextinction of the orienting response (OR) is related to sleep onset. 80 auditory stimuli were presented to 22 male and female undergraduates. Although re-evocation of the skin conductance response (SCR) component of the OR occurred, in the majority of Ss, after 40-50 stimulus presentations, this was not accompanied by any change in cortical alertness as measured by integrated EEG output in 3 frequency bands. However, results indicate that Ss displaying SCR return required more stimulus presentations before initial SCR habituation and displayed more spontaneous fluctuations in skin conductance during the prestimulus period than did nonreturn Ss. Within the return group, latency of SCR return was negatively related to both spontaneous activity during the prestimulus period and number of stimuli to initial habituation. (21 ref)—*Journal abstract.*

8886. Squires, Kenneth C.; Squires, Nancy K. Hillyard, Steven A. (U Illinois) Vertex evoked potentials in a rating-scale detection task: Relation to signal probability. *Behavioral Biology*, 1975(Jan), Vol 13(1), 21-34.—Recorded vertex-evoked potentials from 4 experienced young adults with normal hearing performing

a auditory detection task with rating-scale responses. 3 values of an a priori probability of signal presentation were tested. The amplitudes of the N1 and P3 components of the vertex potential associated with correct detections of the signal were systematically related to the strictness of the response criterion and independent of variations in a priori signal probability. No similar evoked potential components were found associated with signal-absent judgments (misses and correct rejections) regardless of the confidence level of the judgment or signal probability. Results strongly support the contention that the form of the vertex-evoked response was closely correlated with the S's psychophysical decision regarding the presence or absence of a threshold-level signal. Implications for a general hypothesis for describing the sensitivity of the P3 component to psychological variables are discussed. (26 ref)—*Journal abstract*.

8887. Terkildsen, K.; Osterhammel, P. & Huis in't Veld, F. (Rigshospitalet, ENT Clinic F, Copenhagen, Denmark) **Far field electrocochleography, electrode positions.** *Scandinavian Audiology*, 1974, Vol 3(3), 123-129.—Proved, by means of 2 experiments using a total of 15 normal-hearing humans, that activity belonging to the far field electrocochleogram can be detected all over the head, including the tip of the nose. Findings of greatest interest were the tracings from the vertex and the mastoid. The cochlear microphonic response (CM) was present at both sites, but largest at the mastoid and with a phase difference of less than 90°, while the action potential (AP) showed complete phase reversal. From 2.6-5.6 msec the vertex exhibited 3 peaks. At the mastoid the counterpart of the 1st 2 was a single wave, while the 3rd peak was distinct and homophasic. Around 7 msec there was a characteristic potential at the vertex, which could be traced close to the subjective threshold. Optimum recording configurations were (a) for the CM, mastoid vs contralateral side of the neck; (b) for the AP, vertex vs mastoid; (c) for the 7 msec potential, vertex vs homolateral side of the neck.—*Journal abstract*.

8888. Travis, T. A.; Kondo, C. Y. & Knott, J. R. (Southern Illinois U, Medical School) **Parameters of eyes-closed alpha enhancement.** *Psychophysiology*, 1974(Nov), Vol 11(6), 674-681.—In an experiment with 56 undergraduates and university employees, the performance of Ss receiving contingent feedback in an eyes-closed alpha enhancement setting was compared with changes in alpha of Ss receiving random feedback and no feedback. In addition, comparisons were made between (a) binary and continuous feedback signals, (b) integrated and criterion alpha as dependent variables, and (c) eyes-open and eyes-closed alpha enhancement tasks. Results show that (a) increases in emitted occipital alpha under eyes-closed conditions were related to contingent reinforcement; (b) proportional feedback was most efficient in the rapid development of eyes-closed training; (c) larger changes in alpha were seen during eyes-open than during eyes-closed training; (d) binary feedback appeared to be more efficient in increasing eyes-open alpha response; and (e) no relationships between the ability to perform the eyes-open and eyes-closed alpha enhancement tasks were found within Ss. (16 ref)—*Journal abstract*.

8889. Trimble, J. L.; Zuber, B. L. & Trimble, S. N. (U Chicago, Eye Research Lab) **Enhancement of single motor unit activity in the human extraocular electromyogram.** *Vision Research*, 1974(Dec), Vol 14(12), 1327-1332.—Compared the frequency spectra of the single motor unit potential and interference electromyogram from extraocular muscles of 6 adult volunteers with normal oculomotor systems. Results allowed the construction of a filter to enhance these potentials in the presence of interference background activity. The relationships between horizontal eye position and single motor unit activity obtained from filtered data compare favorably with brain-stem single unit recordings. (French, German, & Russian summaries)—*Journal abstract*.

8890. Vanderwolf, C. H. & Cooley, R. K. (U Western Ontario, London, Canada) **Hippocampal electrical activity during long-continued avoidance performance: Effects of fatigue.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 819-823.—Implanted 4 male hooded rats in the dorsal hippocampus and trained them to avoid electric shock by jumping out of a box to a height of 35.5 or 48 cm. Hippocampal slow-wave activity was then recorded continuously during a single session in which avoidance testing was continued to the point of extreme fatigue. Rhythmical slow activity (RSA) always appeared prior to a successful avoidance response and rose in frequency as the instant of jump initiation approached. As the Ss became fatigued and failed to avoid, this anticipatory upward shift in frequency failed to occur. (21 ref)—*Journal abstract*.

### Physiological Processes

8891. Alvarez-Buylla, Ramon & Rocas de Alvarez-Buylla, Elena. (Inst Politecnico Nacional, Mexico City, Mexico) **Hypoglycemic conditioned reflex in rats: Preliminary study of its mechanism.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 155-160.—Conducted an experiment with female Wistar rats implanted in the left carotid artery. A conditioned reflex was established after a series of reinforcements in which an insulin injection (unconditioned stimulus) was associated with the sound of a bell (conditioned stimulus). The hypoglycemic conditioned response was statistically similar to that of insulin. The latency of the beginning of the hypoglycemic response to insulin was between 4 and 6 min. The latency of the conditioned hypoglycemic response to the conditioning stimulus was about 1 min. Blood extracted from a conditioned S during the test of conditioning produced a hypoglycemic effect when injected into a nonconditioned receptor S. It is concluded that a nervous mechanism was involved in eliciting the hypoglycemic response.—*Journal abstract*.

8892. Astic, L. & Royet, J. P. (U Claude Bernard, Villeurbanne, France) **[Sleep in the kangaroo-rat (*Potorous apicalis*): A study in the adult and the young, one month before final leaving of the pouch: Effects of weaning.]** (Fren) *Electroencephalography & Clinical Neurophysiology*, 1974(Nov), Vol 37(5), 483-489.—Studied states of sleep by polygraphic methods in the adult kangaroo-rat and in the young, 1 mo before it finally left the pouch. In the adult, 2 stages of sleep were identified whose behavioral and polygraphic characteristics were

similar to those of higher mammals. The percent time of paradoxical sleep (PS) was 5.8% and the ratio of PS to total sleep was 13%. A clear rhythm in the states of sleep was observed in relation to a 12 hr light-dark cycle. About 1 mo before weaning, the young displayed an electrocorticogram pattern of sleep very similar to that of the adult, but with some characteristics of immaturity: a low percentage of wakefulness (32%) and, particularly, a high percentage of PS (25%). At the beginning of weaning, coinciding with the final emergence of the young from the pouch, there was a 20% increase in wakefulness of slow-wave sleep and PS decreased. The progressive organization of a nycthemeral rhythm of the states of alertness was observed while the animal was still in the pouch.—*English summary.*

8894. Barlow, David H.; Abel, Gene G.; Blanchard, Edward B. & Mavissakalian, Matig. (U Mississippi, Medical Ctr, Jackson) **Plasma testosterone levels in male homosexuality: A failure to replicate.** *Archives of Sexual Behavior*, 1974(Nov), Vol 3(6), 571-575.—Compared the plasma testosterone values for 15 15-35 yr old male homosexuals of Kinsey rating 5 or 6 with the values reported by R. C. Kolodny et al (see PA, Vol 47:11202), who had found male homosexuals to have lower testosterone values than heterosexuals. The values for the present Ss were significantly higher than those reported by Kolodny et al. In fact, the mean values for the current sample did not differ from the mean value reported by Kolodny et al for heterosexual (Kinsey rating 0 or 1) controls. The present findings thus fail to confirm the relation between degree of homosexuality and plasma testosterone level.—*Journal abstract.*

8895. Baxter, Sam. (Medical Coll of St Bartholomew's Hosp, Hackney Hosp, London, England) **Orgasm and labour in primiparae.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 357-360.—A randomly selected group of 54 married primiparous women were interviewed on a large variety of data relating to their pregnancy and sexual behavior including their ability to achieve orgasm during intercourse. It was found that women who had not achieved coital orgasm before pregnancy (20.4%) had a significantly longer 2nd stage of labor and were significantly more likely to have had their labor induced. Nonorgasmic women also tended to have had a longer first stage of labor, were more likely to have had a labor lasting more than 24 hrs, and had a greater blood loss.—*W. G. Shipman.*

8896. Bondy, Stephen C.; Lehman, Ralph A. & Purdy, Janet L. (U Colorado, Medical Ctr, Denver) **Visual attention affects brain blood flow.** *Nature*, 1974(Mar), Vol 284(5447), 440-441.—Explored the hypothesis that intellectual activity increases the rate of blood flow through the brain. 2 small cardboard blinkers were glued to the heads of 3-day-old chicks that had been fasted for the preceding day. The blinkers were positioned adjacent to each eye so that one eye could see only forward and the other only backward. Ss were then

placed in a smooth white circular bowl containing grains of chicken food which they could thus only peck with straight forward pecks. After 10 min brain blood flow was determined and the chicks were sacrificed after 10 sessions. It was found that the regions innervated by the forward-looking eye had a significantly greater rate of blood flow than regions associated with the backward-looking eye. A control group of chicks treated similarly except for the absence of grain in the white bowl in which they were placed, showed no such differences. Explanations for these results are discussed.—R. S. Albin.

8897. Borbély, Alexander A. & Huston, Joseph P. (U Zürich, Inst of Pharmacology, Switzerland) **Effects of two-hour light-dark cycles on feeding, drinking and motor activity of the rat.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 795-802.—Compared the behavior of 7 male CFN COBS albino rats under 2-hr and 12/12 hr cycles. The 2-hr cycles consisted of 60/60 min, 80/40 min and 40/80 min light-dark schedules which were maintained each for 7 days. Water intake, frequency of feeding, and motor activity were still significantly higher during dark than during light, although their occurrence during dark was reduced as compared to the 12/12 hr control schedule. A free-running circadian rhythm of consummatory behavior with a period length exceeding 24 hrs was present throughout the experimental period. The amplitude of the circadian feeding rhythm gradually decreased over time, whereas the percentage of feeding during dark increased. During the circadian phase of minimal food intake, illumination changes affected feeding behavior more strongly than during the phase of maximal food intake. After restoration of the original 12/12 hr cycle, the amplitude of the nocturnal feeding rhythm increased gradually over several days, whereas the amplitude of the drinking rhythm showed a more rapid recovery. Results show that even short cycles of illumination may exert control over the rat's consummatory and motor activity. Short light-dark schedules provide a way for studying separately effects of illumination and of circadian rhythms. (19 ref)—*Journal abstract.*

8898. Brener, Jasper & Jones, J. Michael. (U Hull, England) **Interceptive discrimination in intact humans: Detection of cardiac activity.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 763-767.—Conducted an experiment which demonstrated that individuals could be trained to discriminate between vibratory stimuli that were contingent on their heart beats and vibratory stimuli that displayed the same temporal and physical properties as the contingent stimuli, but that were independent of their heart beats. Data derived from 1 experimental and 2 control groups each comprised of 10 male undergraduate volunteers suggest that the procedure employed may provide a useful means of assessing the ability of intact humans to detect normal variations in visceral activity. (18 ref)—*Journal abstract.*

8899. Brooksbank, B. W.; Brown, R. & Gustafsson, J.-A. (MRC Neuropsychiatry Unit, Carshalton, England) **The detection of 5 $\alpha$ -androst-16-en-3 $\alpha$ -ol in human male axillary sweat.** *Experientia*, 1974, Vol 30(8), 864-865.—Describes research to determine if axillary sweat from human males contains sufficient quantities of 16-dehydro C<sub>19</sub> steroids to be detectable by gas chromatography

and spectrometry. It was found that both androstenol and androstenone occur in axillary sweat from adult men. Implications of these results, in light of the sex-releasing function of androstenol in other mammals, are discussed. (French summary)

8900. Burdick, J. Alan; Stewart, D. Y. & Adamson, J. D. (U Manitoba, Winnipeg, Canada) **Cardiac activity and verbal report of homosexuals and heterosexuals.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 377-385.—20 homosexual and 21 heterosexual males were shown slide stimuli of sexual content. Tonic heart rate (HR) and 4 measures of tonic heart rate variability (HRV) were measured during the slide viewing and these data were compared with an evaluation during the period following the viewing. The evaluations were more uniform and extreme in the heterosexual group. HR increases were higher in both groups for slides of homosexual content. (21 ref)—W. G. Shipman.

8901. Chen, C. S.; Bock, G. R. & Gates, G. R. (Monash U, Clayton, Vic, Australia) **Effect of priming and testing for audiogenic seizures in BALB/c mice as a function of stimulus intensity.** *Experientia*, 1974, Vol 30(2), 153.—Investigated susceptibility to induced audiogenic seizures in 126 BALB/c mice in a 3 (priming intensity)  $\times$  3 (testing intensity) factorial design. Mice were exposed at 21 days to tones of 85, 98, or 114 db and were tested at 28 days for seizures at 1 of these intensities. Priming stimulus intensity was more important than the testing stimulus: mice primed at 85 and 98 db exhibited low test seizures at all testing intensities, whereas all mice primed at 114 db exhibited seizure activity. It is suggested that priming at 114 db increases the auditory system's reactivity to loud sounds. Results are consistent with a sensory deprivation hypothesis of acoustic priming in mice. (German summary)—C. Wright.

8902. Dallaire, A. & Ruckebusch, Y. (Ecole Nationale Vétérinaire, Lab de Physiologie, Toulouse, France) **Rest-activity cycle and sleep patterns in captive foxes (*Vulpes vulpes*).** *Experientia*, 1974, Vol 30(1), 59-60.—Studied the sleep-activity cycle adaptation of the fox to a restricted laboratory environment. The 24-hr activity cycle of 3 foxes (2 male, 1 female), captured at the age of 2 mo, was recorded when they were 1 yr old. Measurements were made with an electrocardiogram, electrocorticogram, and electromyogram. 2 phases of activity were indicated: between 20.00 hrs and 1.00 hrs, and between 7.00 hrs and 8.00 hrs. Food ingestion was restricted to the evening period. Results indicate that captivity does not greatly modify the natural rest-activity cycle of the foxes. (French summary)—R. Tomasko.

8903. Damon, Albert & Bajema, Carl J. **Age at menarche: Accuracy of recall after thirty-nine years.** *Human Biology*, 1974(Sep), Vol 46(3), 381-384.—Among 143 women whose menarcheal age was documented during a longitudinal growth study, recall 39 yrs after the event gave the following results: menarche was recalled as .2 yrs earlier than the actual date ( $p = .05$ ), the standard deviation of recalled age was .3 yrs larger ( $p = .01$ ), and the coefficient of correlation,  $r$ , between actual and recalled age was .6.—S. L. Warren.

8904. Davis, Harry N.; Gray, Gary D.; Zerylnick, Matthew & Dewsbury, Donald A. (U Florida) **Ovulation**

**and implantation in montane voles (*Microtus montanus*) as a function of varying amounts of copulatory stimulation.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 383-388.—A total of 46 estrous female voles received (a) no copulation, (b) 1 ejaculatory series, (c) 2 ejaculatory series, or (d) more than 2 series. 18 sexually experienced males served as mating partners. Copulation was essential for ovulation, and increasing amounts of copulatory stimulation increased the probability of ovulation. Only 25% of females receiving 1 ejaculatory series ovulated, whereas 100% of those receiving more than 2 series ovulated. Thus, multiple ejaculations play an important role in successful reproduction in this species. (26 ref)—*Journal abstract*.

8905. Fröberg, Jan E. **Circadian rhythms in catecholamine excretion, performance and self-ratings.** *Reports from the Laboratory for Clinical Stress Research*, 1974(Apr), No 36, 22 p.—Circadian rhythms in urinary catecholamine excretion, performance on an electronic rifle range, and self-ratings were studied with 29 servicemen deprived of sleep for 72 hrs. Adrenaline excretion and fatigue ratings showed the most consistent diurnal variations; noradrenaline and shooting performance rhythms were more irregular. The average phase for adrenaline excretion was about 14 hrs, for noradrenaline about 8 hrs, for shooting range performance 17 hrs, and fatigue 5 hrs. 24-hr performance scores and subjective ratings of arousal decreased over the 3 days, while adrenaline excretion levels increased. Even with regularly spaced meals and other activities in the artificially lighted environment, adrenaline excretion, performance, and arousal were low during the night and higher during the day. A phase difference of a few hours between the physiological and psychological circadian rhythms is suggested. (28 ref)—*Journal summary*.

8906. Geer, James H.; Morokoff, Patricia & Greenwood, Pamela. (State U New York, Stony Brook) **Sexual arousal in women: The development of a measurement device for vaginal blood volume.** *Archives of Sexual Behavior*, 1974(Nov), Vol 3(6), 559-564.—Showed erotic and nonerotic films to 20 undergraduate women. A vaginal photoplethysmograph was developed to measure pressure pulse and vaginal blood volume during film presentations. All Ss yielded a visible increase in pressure pulse amplitude during the presentation of the erotic films. Statistical analyses of the pressure pulse data strongly confirmed ( $p < .001$ ) the visual impressions. In addition, total blood volume in the vaginal wall also increased during the presentation of the erotic film. Subjective ratings of sexual arousal did not correlate with physiological measures. Results indicate that measures obtained from the device appear to be useful for detecting sexual arousal in women.—*Journal abstract*.

8907. Gray, Gary D.; Zerylnick, Matthew; Davis, Harry N. & Dewsbury, Donald A. (U Florida) **Effects of variations in male copulatory behavior on ovulation and implantation in prairie voles, *Microtus ochrogaster*.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 389-396.—Conducted 2 experiments with a total of 100 female and 29 male adult voles. One ejaculatory series was sufficient for induction of ovulation and implantation, and a 2nd series did not elicit any increase in either the

probability of ovulation or the number of corpora lutea and implanted embryos. Within the 1st ejaculatory series, the probability of ovulation increased with increased numbers of intromissions and intravaginal thrusts. Mounting without vaginal penetration was not sufficient to induce ovulation. It is suggested that *Microtus* species display a coadaptation of male copulatory behavior and stimulation requirements of the female reproductive system.—*Journal abstract*.

8908. Guttman, Ruth; Liebllich, Israel & Gross, Ruth. (Hebrew U Jerusalem, Israel) **Behavioral correlates of estrous cycle stages in laboratory mice.** *Behavioral Biology*, 1975(Jan), Vol 13(1), 127-132.—70 virgin female mice of 2 inbred strains (DBA/1J and C57BL/6J) and an F<sub>1</sub> cross between them displayed rhythmicity in behavior variables with changes in estrous cycle stage. Motor activity in the barrier apparatus, as measured by jumping, reached a peak during estrus and decreased between metestrus and diestrus. Anxiety—as expressed by defecation—followed an exactly opposite pattern. "Peeking," a complex trait including anxiety and exploration, followed no discernible pattern. During the 5 min of the observation period, jumping increased with time in the apparatus during all estrous stages, acting as a typically adaptive trait. The peeking pattern was far less clear-cut. It is concluded that, while a clear-cut correlation existed between estrus and locomotor activity, the association was less straightforward with estrus and more diffuse kinds of activity.—*Journal abstract*.

8909. Hilgard, Ernest R. et al. (Stanford U) **Heart rate changes in pain and hypnosis.** *Psychophysiology*, 1974(Nov), Vol 11(6), 692-702.—Measured heart rate in 4 experiments using the cold pressor test. Data from 53 high school and 65 college students and 12 highly hypnotizable Ss show that (a) the heart rate rise between relaxation and stress levels was significant when the water was sufficiently cold (significant in 0° and 5°C water, not 10°C); (b) the amount of heart rate rise in the normal waking state in 0°C water was unrelated to the hypnotizability of the S; (c) there was a significant difference in heart rate following a hypnotic induction with suggestions of analgesia, although the reduction in heart rate rise was unrelated to the amount of reduction in felt pain; and (d) heart rate rise during hallucinated pain in highly hypnotizable Ss was not significantly different from the rise recorded during normal waking or hypnotically analgesic conditions.—*Journal abstract*.

8910. Hirschman, Richard & Brumbaugh-Buehler, Barbara. (Kent State U) **Electrodermal habituation and subjective response: Effects of manifest anxiety and autonomic arousal.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 46-50.—Studied the effects of cortical function and individual differences on galvanic skin response (GSR) habituation to tones of low and moderate intensity. 40 female undergraduates were divided into high- and low-anxious groups, on the basis of their Taylor Manifest Anxiety scale scores, and into high- and low-arousal groups, on the basis of their resting-level GSR activity. High-anxious Ss perceived nonchanging, nonnoxious moderate and low tones as increasing in intensity over trials while their electrodermal responses to the tones were habituating. Although the low-anxious group and the high- and low-arousal

groups also showed electrodermal habituation, there were no significant effects of trials for intensity ratings. (17 ref)—*Journal abstract*.

8911. Jackson, Jan C. (U Wisconsin, Medical School, Lab of Neurophysiology, Madison) **Amplitude and habituation of the orienting reflex as a function of stimulus intensity.** *Psychophysiology*, 1974(Nov), Vol 11(6), 647-659.—Conducted 2 within-S experiments with 20 male undergraduates in each and 1 between-S experiment with 100 male undergraduates to examine effects of stimulus intensity on orienting response amplitude and habituation. 5 intensities of a 1000 Hz tone were presented, ranging from 0 to 40 db in Exp I and from 0 to 80 db in Exps II and III. Response measures were skin conductance response (SCR) and heart rate (HR). SCR amplitude increased monotonically with stimulus intensity while HR deceleration tended to decrease, increase, and finally decrease again as intensity increased. Not only was deceleration greatest at 0 db but it was more resistant to habituation. Several intensities of test stimulation were presented after habituating stimuli in the between-S experiment. The SCR to test stimuli was facilitated by habituation at 0 db and depressed by habituation at 80 db. Results suggest a direct relationship between stimulus intensity and development of habituation. (19 ref)—*Journal abstract*.

8912. Kasang, G.; Knauer, Barbara & Beroza, M. (Max-Planck-Inst für Biochemie, München, W Germany) **Uptake of the sex attractant <sup>3</sup>H-disparlure by male gypsy moth antennae (*Lymantria dispar*) [*-Porthetria dispar*].** *Experientia*, 1974, Vol 30(2), 147-148.—Exposed batches of 10 antennae from newly emerged adult male gypsy moths to an air stream containing <sup>3</sup>H-disparlure. Distribution of <sup>3</sup>H-activity was a function of duration of incubation of antennae. It is noted that penetration of pheromones is more specific in insect antennae than previously thought. (German summary) (16 ref)

8913. Katz, David. (Washington U) **Relaxation due to verbal suggestion: A psychophysiological study.** *Psychological Record*, 1974(Fal), Vol 24(4), 523-532.—Evaluated the effects of the verbal aspects of relaxation training procedures on physiological arousal. 3 groups of 30 17-26 yr old normal Ss participated in 5 experimental sequences consisting of a 1-min period of mental arithmetic followed by a 2-min recovery period. During recovery periods the relaxation group (R) received suggestions to feel relaxed, while comparison groups either received messages irrelevant to relaxation or rested in silence. Electrodermal (skin resistance) indices of physiological arousal revealed significantly lower scores for Group R during recovery periods. Results support the hypothesis that suggestion is an active ingredient in relaxation training. Implications for suggestive-related placebo and expectancy effects are discussed. (25 ref)—*Journal abstract*.

8914. Kozłowski, Stanisław & Domaniecki, Janusz. (Polish Academy of Sciences, Lab of Applied Physiology, Warsaw) **Thermoregulation during physical effort in humans of different physical performance capacity.** *Acta Physiologica Polonica*, 1972, Vol 23(5), 815-825.—Found that rectal temperature increased significantly in Ss of low physical performance capacity after physical

exertion requiring 65% of maximum oxygen intake. (26 ref)

8915. Lang, Peter J. & Twentyman, Craig T. (U Wisconsin, Madison) **Learning to control heart rate: Binary vs analogue feedback.** *Psychophysiology*, 1974(Nov), Vol 11(6), 616-629.—Used 22 male undergraduates to test the efficiency of 2 procedures, one emphasizing analog and the other binary feedback, in training human Ss to change their heart rate. Ss were seen for 7 separate sessions, which included 2 training sessions in speeding heart rate and 2 devoted to slowing. Both heart rate and respiration cycle length were recorded. The timing of the experiment, presentation of instructions, feedback, data acquisition, and primary data reduction were all accomplished by a computer. The feedback mediated acquisition of directional changes in heart rate, and these changes were sustained on instruction with feedback removed. No differences between the binary and analog procedures were noted for slowing. However, the analog display prompted significantly greater instructed acceleration than the binary method. An important distinction was made between organ feedback (heart activity) and task performance feedback (relative success or failure). It is noted that the acquisition of heart rate speeding and slowing appear to involve different psychophysiological mechanisms.—*Journal abstract*.

8916. McConaghy, N. (U New South Wales, Sydney, Australia) **Penile volume responses to moving and still pictures of male and female nudes.** *Archives of Sexual Behavior*, 1974(Nov), Vol 3(6), 565-570.—12 medical students were shown 2 series of 10 pictures of orange circles followed by pictures of nude females, alternating at 1-min intervals with 10 pictures of blue triangles followed by pictures of nude males. All were shown for 10 sec. In one series, the pictures were moving and were inserted into a travelog film; in the other, they were still, and still pictures of landscapes were shown in the intervals. 6 students were randomly allocated to watch the moving sequences first; the other 6 watched the still sequences first. The summed penile volume increases of the students to the moving pictures of the women were significantly greater than those to the still pictures, and conditioned penile increases were greater to the pictures of circles preceding these moving pictures compared with those to circles preceding the still pictures. Only the former conditioned responses correlated significantly with the unconditioned penile responses on which they were based. It is concluded that conditioned penile volume increases could be established more satisfactorily using moving rather than still pictures of female nudes as unconditioned stimuli. The summed penile response to 10 such still stimuli nevertheless provided a reliable measure of the Ss' responsiveness.—*Journal abstract*.

8917. McCuaig, Larry W. (Dalhousie U, Faculty of Medicine, Halifax, Nova Scotia, Canada) **Salivary electrolytes, protein and pH during transcendental meditation.** *Experientia*, 1974, Vol 30(9), 988-989.—Examined the relationship of mineral metabolism to the state of consciousness induced by transcendental meditation. Meditation produced an increase in salivary minerals: Na (70%), Mg (42%), Ca (36%), Pi (46%), and

K (23%). Salivary pH decreases and protein content increases were noted. (French summary)

8918. McMahon, C. E. (State U New York, Buffalo) **Voluntary control of "involuntary" functions: The approach of the Stoics.** *Psychophysiology*, 1974(Nov), Vol 11(6), 710-714.—The Stoics expressed great concern about emotion-related psychophysiological phenomena as pathological states of body and spirit. They outlined procedures through which all bodily functions could be brought under voluntary control. The Pneumatist school of medicine of the 1st century A.D. adopted these philosophical convictions and instituted them in their diagnostic and treatment techniques for psychosomatic disorders. Pneumatic theory, and its application in this context, is described.—*Journal abstract*.

8919. Michael, Richard P.; Bonsall, R. W. & Warner, Patricia. (Emory U, Medical School) **Human vaginal secretions: Volatile fatty acid content.** *Science*, 1974(Dec), Vol 186(4170), 1217-1219.—Collected 682 vaginal samples by a tampon method from 50 healthy young university women. Samples were analyzed by gas chromatography. The volatile aliphatic acids increased during the late follicular phase of the menstrual cycle and declined progressively during the luteal phase. Women on oral contraceptives had lower amounts of volatile acids and did not show any rhythmic changes in acid content during the menstrual cycle. It is noted that these same substances possess sex-attractant properties in other primate species.—*Journal abstract*.

Contact with this compound is postulated to enable adult males to discriminate sexually through antennal contact. (German summary)

8922. Paré, William P. & Isom, Kile E. (VA Hosp, Pavlovian Research Lab, Perry Point, MD) **Gastric secretion as a function of acute and chronic stress in the gastric fistula rat.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 431-435.—Conducted 2 experiments using a total of 54 male Long-Evans rats chronically implanted with gastric cannulas. In Exp I Ss exposed to signaled and unsignaled grid shock secreted more gastric acid after shock stress (chronic stress) for 8 days compared to the 1st 12 hrs of shock stress (acute stress). However, Exp II indicated that the higher gastric acid values under chronic stress were not significantly greater than prestress baseline values. Results are interpreted to reflect an inhibition of gastric acid secretion as a function of acute stress. During chronic stress this inhibition was followed by an habituation of gastric secretory processes which was

observed as a return of secretion volume to baseline levels.—*Journal abstract.*

8923. Pátkai, Paula; Johansson, Gunn & Post, Birgitta. (U Stockholm, Psychological Lab, Sweden) **Mood, alertness and sympathetic-adrenal medullary activity during the menstrual cycle.** *Psychosomatic Medicine*, 1974(Nov-Dec), Vol 36(6), 503-512.—Studied 6 healthy women during a daily work routine for a period covering 2 menstrual cycles. Urinary catecholamines and body temperature were measured each morning of ordinary weekdays. On each occasion estimates of subjective mood and alertness were obtained. 4 periods of the menstrual cycle—premenstrual, postmenstrual, ovulation, and postovulation—were compared with respect to physiological and subjective variables. No significant differences in adrenaline and noradrenaline excretion between periods were found. Estimates of subjective states did not generally differ between periods except for feelings of restlessness. Night sleep was most disturbed during premenstrual, coinciding with the longest sleep duration. All physiological variables exhibited a high degree of intraindividual constancy during the cycle. (22 ref)—*Journal abstract.*

8924. Pearlman, Chester & Becker, Michael. (Boston VA Hosp, MA) **REM sleep deprivation impairs barpress acquisition in rats.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 813-817.—Conducted a study with 110 Long-Evans rats in which brief REM sleep deprivation immediately after training temporarily retarded the Ss' barpress acquisition, abolished observational learning of the barpress habit, and prevented adaptation to a shift from a continuous reinforcement to a differential reinforcement of low rate schedule. Results support the information-processing model of REM sleep function. (16 ref)—*Journal abstract.*

8925. Pirke, Karl M.; Kockott, Götz & Dittmar, Franz. (Max-Planck-Inst für Psychiatrie, München, W Germany) **Psychosexual stimulation and plasma testosterone in man.** *Archives of Sexual Behavior*, 1974(Nov), Vol 3(6), 577-584.—Measured plasma testosterone every 15 min for 3½ hrs in 8 21-34 yr old males before, during, and after the showing of a sexually explicit movie. There was an average increase of 35% in testosterone. The maximum concentration was observed 60-90 min after the end of the film. No increase was found in 8 control Ss who saw a sexually neutral film.—*Journal abstract.*

8926. Robinson, G. Wilse. (California Inst of Technology, Arthur Amos Noyes Lab of Chemical Physics) **Rhodopsin cooperativity in visual response.** *Vision Research*, 1975(Jan), Vol 15(1), 35-48.—Proposes a theory of vertebrate scotopic vision. The essence of the theory is that absorption of 1 photon in the disc membrane gives rise to transmitter release through cooperativity among a number (10-50, depending on vertebrate species) of unbleached rhodopsin molecules. Conclusions based upon the theory are in good agreement with both psychophysical and electrophysiological threshold experiments carried out in the absence of background illumination. Empirical incorporation of a generalized Weber-Fechner law allows the theory to be applied in the case of certain backgrounds. (French, German, & Russian summaries) (59 ref)—*Journal abstract.*

8927. Schwartz, R.; Sackler, A. M. & Weltman, A. S. (Brooklyn Coll of Pharmacy, Long Island U, Lab for Therapeutic Research) **Adrenal relationships to aggressiveness in isolated female mice.** *Experientia*, 1974, Vol 30(2), 199-200.—Tested 46 isolated and Lab for Therapeutic Research, 22 paired U aggressiveness by introducing brown naive female mice into home cages weekly for 5-min periods. Isolated mice showed significant increases in body weights and locomotor activity and decreases in white blood cell counts. Organ weights at sacrifice indicated heavier adrenals and significantly higher plasma corticosterone titers in isolated than in paired Ss. Although total adrenal catecholamine levels did not differ between the 2 groups, isolated Ss classified as fighters had higher levels than isolated nonfighters. Findings are consistent with previous studies using male mice that indicated higher sympathetic-adrenal activity in isolated fighters vs nonfighters. (French summary) (26 ref)—*C. Wright.*

8928. Sheldrake, Peter & Cormack, Margaret. **Dream recall and the menstrual cycle.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 347-350.—Convergers, people who score higher on conventional IQ tests than on open-ended tests, were compared with divergers, those with the opposite bias. Divergers are more likely to recall a dream in REM sleep, while convergers report more dreams when awakened from non-REM sleep. 26 female biology students tended to be divergent when tested in the pre-ovulatory stage of their menstrual cycle and convergent during the final stage of the cycle. 4 divergers had most dreams in the pre-ovulatory stage while 3 convergers had the most dreams in the premenstrual stage of their cycle.—*W. G. Shipman.*

8929. Södersten, P.; de Jong, F. H.; Vreeburg, J. T. & Baum, M. J. (U Göteborg, Sweden) **Lordosis behavior in intact male rats: Absence of correlation with mounting behavior or testicular secretion of estradiol-17 $\beta$  and testosterone.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 803-808.—From a population of 64 Danish and 8 Dutch male Wistar rats, groups of intact Ss were selected according to whether or not they displayed lordosis in response to manual stimulation. In subsequent tests with estrous females no differences in mounting behavior were found between males which did or did not display lordosis. Estimation of the steroid hormones, estradiol-17 $\beta$  and testosterone, in testicular venous and peripheral plasma by radioimmunoassay showed that there was no relationship between the concentrations of these hormones and the display of either mounting behavior or lordosis elicited by the mounts of stud males. Findings show that sexual performance is not directly correlated with testicular secretion of hormones, and it is suggested that individual differences in mating behavior are caused by some other factor such as individual differences in neural sensitivity to gonadal hormones. (22 ref)—*Journal abstract.*

8930. Strahan, Robert F.; Todd, John B. & Inglis, Geoffrey B. (U Rochester) **A palmar sweat measure particularly suited for naturalistic research.** *Psychophysiology*, 1974(Nov), Vol 11(6), 715-720.—Describes a simple measure of palmar sweating that seems especially applicable to naturalistic research. A sweat sample is collected by inverting a small bottle of distilled water on

a palm or a fingertip. Inexpensive, simple apparatus is later used to measure the sweat solution's electrical conductivity. Substantial evidence speaking to issues of reliability and validity warrants further exploration of this measure.—*Journal abstract.*

8931. Velden, M. (U Mainz, W Germany) **An empirical test of Sokolov's entropy model of the orienting response.** *Psychophysiology*, 1974(Nov), Vol 11(6), 682-691.—Tested several hypotheses derived from Y. N. Sokolov's entropy model of the orienting response (OR). The galvanic skin response (GSR) served as the indicator of the OR. Printed language, analyzed with regard to the information content in bits, was used as stimulus material. 48 female students served as Ss. Results indicate that (a) the uncertainty of a situation does not determine the strength of the OR; (b) the strength of the OR depends on the information carried by an event; and (c) the processing of this information, as indicated by the OR, may be delayed by one or more events in a serial application. For tonic level over a series of events no trend could be found. (28 ref)—*Journal abstract.*

8932. Vick, K. W. et al. (USDA Agriculture Research Service, Biology Research Lab, Gainesville, FL) (Z-E)-7,11-hexadecadien-1-ol acetate: The sex pheromone of the angoumois grain moth, *Sitotroga cerealella*. *Experientia*, 1974, Vol 30(1), 17-18.—Describes the isolation, identification, and synthesis of the sex pheromone (male attractant) of the female Angoumois grain moth. (German summary)

### Genetics

8933. Akcasu, A.; Kameswaran, Lalitha; Sanyal, R. K. & West, G. B. (U Istanbul, Medical School, Turkey) **Taste thresholds of phenylthiocarbamate.** *Behavior Genetics*, 1974(Dec), Vol 4(4), 305-315.—Reports that the common frequency of the nontasting gene for phenylthiocarbamate (about 28%) was found both in 301 Indian adults and in 305 Indian children aged 6-11 yrs. However, a much lower frequency (less than 11%) was obtained when both 315 Turkish adults and 306 6-11 yr old Turkish children were tested. On the other hand, 180 English children under the age of 7 yrs possessed a higher frequency (up to 60%). 327 English children aged 9 yrs or older had a frequency comparable with that of 581 English adults (about 28%). It was found that between the ages of 7 and 9 many English nontaster children became tasters, which accounts for the observed change in frequency.—*Journal abstract.*

8934. Angus, John. (U Birmingham, England) **Genetic control of activity, preening, and the response to a shadow stimulus in *Drosophila melanogaster*.** *Behavior Genetics*, 1974(Dec), Vol 4(4), 317-329.—Spontaneous locomotor activity, preening, and the change in frequency of each in response to a shadow have been studied in *Drosophila melanogaster* by a time-sampling technique. The genetic control of these 4 behaviors was elucidated in the present study by application of biometrical genetic analysis. A total of 2,800 flies were tested, 200 from each of 14 generations comprising 2 inbred lines, 6C/L and Edinburgh, and their F<sub>1</sub> s, F<sub>2</sub> s, and first backcrosses including all reciprocals. The genetic architecture for spontaneous activity indicated a history of natural

selection for comparatively high activity. There was a tendency for both activity and preening to decrease in response to shadow stimulation. The genetic control indicates that this form of reaction is advantageous and suggests a relation to the avoidance of predation. (42 ref)—*Journal abstract.*

8935. Eleftheriou, B. E.; Bailey, D. W. & Denenberg, V. H. (Jackson Lab, Bar Harbor, ME) **Genetic analysis of fighting behavior in mice.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 773-777.—In 5 experiments, isolation-induced fighting behavior measured in a neutral arena for 5 min/day over a 5-day period differed significantly in C57BL/6By and BALB/cBy male mice. Evaluation of this performance in reciprocal F<sub>1</sub> hybrids of these 2 inbred strains and their recently developed recombinant inbred strains permitted the derivation of an hypothesis regarding possible genetic control of this behavior in mice. Additionally, examination was made regarding the possible influences of maternal social and uterine environments on fighting behavior. It is tentatively concluded that isolation-induced fighting behavior in mice is influenced by at least 2 homozygous loci and by a possible cytoplasmic factor of the ovum. (16 ref)—*Journal abstract.*

8936. Holmes, T. M.; Aksel, R. & Royce, J. R. (U Alberta, Edmonton, Canada) **Inheritance of avoidance behavior in *Mus musculus*.** *Behavior Genetics*, 1974(Dec), Vol 4(4), 357-371.—Studied the inheritance of avoidance behavior in 2,204 mice (*Mus musculus*) consisting of the inbred strains A/HeJ, BALB/cJ, SWR/J, and 129/J, and F<sub>1</sub> and F<sub>2</sub> generations of all their crosses, and the 1st generation of their backcrosses. The mode of inheritance of avoidance behavior was different in the 2 sexes. In the males it was transmitted predominantly as an overdominant trait, whereas in the females both overdominance and partial dominance were observed. Significant nonallelic interaction was found mostly in the male data, indicating that the dominance observed in the males may be inflated. (38 ref)—*Journal abstract.*

8937. Horn, Joseph M. (U Texas) **Aggression as a component of relative fitness in four inbred strains of mice.** *Behavior Genetics*, 1974(Dec), Vol 4(4), 373-381.—In 3 separate experiments, male mice from the RF/J, BALB/cJ, DBA/2J, and C57BL/6J strains were grouped in a seminaturalistic environment with females from the C57BL/6J strain. Observations were made concerning the aggressive behavior of the different strains, and starch gel electrophoresis of the esterase III and hemoglobin proteins was used to determine paternity of the offspring. Results indicate that the most aggressive strain, RF/J, sired 95.6% of all offspring. Control groups indicated that the reproductive disadvantage of the BALB and C57 males could be explained in terms of differences in general fertilizing ability, the effects of grouping mice together, or pregnancy blockage. These factors alone were not sufficient to explain the disadvantage of the DBA males. Differences in fighting success may therefore be an important determinant of fitness differences between RF and DBA males.—*Journal abstract.*

8938. Kristal, Mark B. & Eleftheriou, Basil E. (State U New York, Buffalo) **Placentophagia in nonpregnant nulliparous mice: A genetic investigation.** *Behavioral*

*Biology*, 1975(Jan), Vol 13(1), 113-119.—Investigated the genetic influence on the response of nonpregnant nulliparous mice to foster placenta. 16 virgin female mice in each of 2 highly inbred strains (BALB/cBy and C57BL/6By), their F<sub>1</sub> hybrids, a backcross generation, and 7 recombinant-inbred strains derived from the F<sub>1</sub> generation were tested. It is concluded that there is a genetic component to the response of female mice to placenta in the absence of previous experience and that more than 1, but possibly as few as 2, loci are involved. Alternative explanations of average dominance for placentophagia and for no placentophagia (by the promotion of competing responses) are considered.—*Journal abstract*.

8939. Padeh, Benjamin; Wahlsten, Douglas & DeFries, J. C. (Bar-Ilan U, Ramat-Gan, Israel) **Operant discrimination learning and operant bar-pressing rates in inbred and heterogeneous laboratory mice.** *Behavior Genetics*, 1974(Dec), Vol 4(4), 383-393.—118 male and 125 female mice from 4 inbred strains (A/1bg, BALB/c1bg, C57BL/61bg, and DBA/21bg) and a heterogeneous line (HS/1bg) were first reduced to 90% of their *ad libitum* body weight and were then trained to press a bar to obtain food pellets. After 9 days of training with a continuous schedule of reinforcement (CRF), mice were required to discriminate between conditions of reward and nonreward as indicated by a tone and a light; discrimination training continued for 21 days. Considerable genetic variation was apparent for asymptotic pressing rates under CRF as well as discrimination performance. However, the highest discrimination ratios were achieved by mice with the lowest pressing rates. Results are discussed in terms of associative and nonassociative processes which may contribute to genetic variation in performance on learning tasks. (20 ref)—*Journal abstract*.

8940. Parsons, P. A. (La Trobe U, Bundoora, Vic, Australia) **Male mating speed as a component of fitness in *Drosophila*.** *Behavior Genetics*, 1974(Dec), Vol 4(4), 395-404.—A review of the literature on *Drosophila* shows that male mating speed or male virility is probably the most important component of fitness. Rapid matings tend to be controlled by the male genotype, while the genotype of the female may assume importance for slower matings. Where data exist, male mating speed is subject to directional selection in the direction of rapid speed, as would be expected for an important component of fitness. (30 ref)—*Journal abstract*.

8941. Tobach, E.; Bellin, J. S. & Das, D. K. (American Museum of Natural History, New York, NY) **Differences in bitter taste perception in three strains of rats.** *Behavior Genetics*, 1974(Dec), Vol 4(4), 405-410.—Reports that micromolar concentrations of cycloheximide (CH) can be used to test for genetic differences in the ability to taste bitter substances. 30 rats of 3 related strains of rats—Fawn-hooded, Long Evans, and Wistar—differed significantly in their ability to taste this substance, the former being unusually deficient in this respect. Wistar and Long Evans rats were able to perceive millimolar concentrations of phenylthiocarbam-

ide (PTC) and 0.2  $\mu$ M CH. Fawn-hooded Ss were unable to detect millimolar PTC and first recognized CH when it was present in 1.5  $\mu$ M concentration. (15 ref)—*Journal abstract*.

## PSYCHOPHARMACOLOGY AND PHYSIOLOGICAL INTERVENTION

8942. Agadzhanian, N. A.; Doronin, G. P. & Elfmov, A. I. [Influence of pressure-chamber training on conditioned chain motor reflexes.] (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 37-45.—Subjected 132 male white rats to hypoxia during 10 days of pressure-chamber training at an altitude of 5000 m. Their adaptation involved reorganization of physiological reactions to provide more effective use of oxygen. The reorganization helped to reduce disturbances of the structural and temporal characteristics of chain motor reflexes and contributed to a more rapid recovery of complex behavior in the Ss after acute oxygen deficiency. The adaptive potentialities of the organism were lowered in Ss devoid of sinocarotid receptive zones. This indicates the important role of these chemoreceptors in the trigger compensatory-adaptive reactions of the organism and in maintaining adequate functioning of the higher parts of the brain during acute hypoxia. (16 ref)—*English abstract*.

8943. Arn, H.; Schwarz, C.; Limacher, H. & Mani, E. (Swiss Federal Research Station for Arboriculture, Viticulture & Horticulture, Wädenswil) **Sex attractant inhibitors of the codling moth *Laspeyresia pomonella* L.** *Experientia*, 1974, Vol 30(10), 1142-1144.—Studied the characteristics of sex attractant inhibitors. Implications for the usage of the inhibitors in insect control, reproductive isolation, and selective pest monitoring are discussed. (German summary)

8944. Barchas, Jack D. et al. (Stanford U, Medical School, Lab of Behavioral Neurochemistry) **Tryptolines: Formation from tryptamines and 5-MTHF by human platelets.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 862-867.—Reports that an enzymatic preparation from human platelets uses 5-MTHF as a cofactor to convert tryptamine and 2 tryptamine derivatives to tryptolines (tetrahydro- $\beta$ -carboline), a class of tricyclic compounds. Findings suggest the need for further examination of the pharmacological and psychological effects of tryptolines.

8945. Belluzzi, J. D.; Ritter, S.; Wise, C. D. & Stein, L. (Wyeth Lab, Philadelphia, PA) **Substantia nigra self-stimulation: Dependence on noradrenergic reward pathways.** *Behavioral Biology*, 1975(Jan), Vol 13(1), 103-111.—Conducted 3 experiments with a total of 33 experimental and 9 control male Charles River rats. Electrodes in the dopamine cell groups of the substantia nigra lost their ability to support self-stimulation after mechanical or chemical damage to ipsilateral noradrenergic pathways, or after pharmacological inhibition of norepinephrine synthesis. Replenishment of depleted stores of norepinephrine by central administration of exogenous transmitter selectively reinstated the suppressed behavior. These findings, which demonstrate an essential role for norepinephrine in the mediation of substantia nigra self-stimulation, lend no support to the hypothesis that self-stimulation can result from the

activation of dopamine neurons alone. (27 ref)—*Journal abstract*.

8946. Carroll, Marilyn E. & Smith, James C. (Florida State U) Time course of radiation-induced taste aversion conditioning. *Physiology & Behavior*, 1974(Dec), Vol 13(6), 809-812.—Taste aversion conditioning was used with 162 male Sprague-Dawley albino rats to define the onset and duration of the period after exposure to 100 R gamma radiation which was most aversive to the Ss. Ss were irradiated and then allowed to drink a saccharin solution. A significant decrement appeared in their cumulative intake, compared to sham Ss at 90 min postexposure. When time delays between 0-90 min were imposed between offset of the radiation beam (unconditioned stimulus, UCS) and onset of saccharin exposure (conditioned stimulus, CS), the time at which a significant decrement in saccharin drinking occurred remained constant at 90 min. With UCS-CS delays of 2, 4, and 6 hrs a weaker aversion was found in terms of the time span before a significant decrement in the irradiated groups' saccharin drinking rate appeared. Groups which were irradiated then allowed access to tap water for 24 hrs, either immediately or 1.5 hrs after radiation offset, showed no decrement in their water drinking rate with respect to a sham control. The procedures used in this experiment provide a method for measuring the latency of onset of subtle physiological effects.—*Journal abstract*.

8947. Carter, Carol S. & Porges, Stephen W. (U Illinois) Ovarian hormones and the duration of sexual receptivity in the female golden hamster. *Hormones & Behavior*, 1974(Dec), Vol 5(4), 303-315.—In 2 experiments with a total of 112 female hamsters, the induction of sexual receptivity and its maintenance after copulation in ovariectomized Ss was a function of the levels of ovarian hormones administered. Various combinations of estradiol benzoate (.6-666 µg) and progesterone (.05-5.0 mg) were administered. Although some Ss responded at .6 µg, higher levels of estradiol benzoate (1-6 µg or more) were more effective in inducing levels of lordosis equivalent to those seen in intact Ss in natural estrus. After mating, a depression in lordosis was observed in both ovariectomized and intact Ss. However, in ovariectomized Ss (excluding those that did not respond initially) the duration of postcopulatory receptivity was a function of the level of progesterone administered. High levels of progesterone tended to prolong slightly the duration of postcopulatory receptivity. (25 ref)—*Journal abstract*.

8948. Chapman, Harold W. & Richardson, H. Mark. (U Guelph, Ontario, Canada) The role of systemic hydration in the acquisition of schedule-induced polydipsia by rats. *Behavioral Biology*, 1974(Dec), Vol 12(4), 501-508.—Conducted 3 experiments with a total of 32 male Sprague-Dawley rats. Intragastric water prevented the acquisition of schedule-induced polydipsia by Ss despite its lack of effect on established polydipsia. When drinking was maintained (by the prior induction of dry-mouth drinking) schedule-induced polydipsia was acquired in spite of intragastric hydration. Results suggest that polydipsia is an acquired, operant, behavior rather than an exaggeration of an existing behavior.—*Journal abstract*.

8949. Cheng, Mei-fang & Silver, Rae. (Hunter Coll, City U New York) Estrogen-progesterone regulation of nest-building and incubation behavior in ovariectomized ring doves (*Streptopelia risoria*). *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 256-263.—Determined the role of ovarian hormones in the induction of nest-building (tucking) and incubation behavior in female doves by systemic injections of estrogen, or progesterone, or estrogen combined with progesterone, or oil in 40 reproductively experienced, ovariectomized Ss. Combined estrogen and progesterone treatment was the most effective hormone regimen for eliciting both behavior patterns in females and also facilitated these behaviors in their 40 untreated mates. Differences in role of the gonadal progesterone in male and female doves are discussed. (23 ref)—*Journal abstract*.

8950. Damstra, Terri; Entingh, Dan; Wilson, John E. & Glassman, Edward. (U North Carolina, Medical School, Div of Chemical Neurobiology, Chapel Hill) Incorporation of <sup>3</sup>H-L-fucose into brain glycoproteins during environmental stimulation following intracranial, intravenous, or subcutaneous injections. *Behavioral Biology*, 1975(Jan), Vol 13(1), 121-126.—Conducted a series of experiments with a total of 84 male C57BL/6J mice. Previously reported changes in the amount of <sup>3</sup>H-letofucose incorporated into glycoproteins of brain and liver after subcutaneous injections of precursor when Ss were exposed to the training apparatus did not occur when the precursor was injected either intracranially or intravenously. The increased incorporation of subcutaneously injected <sup>3</sup>H-letofucose was attenuated by sham intracranial and by sham intravenous injections. Thus, the failure to detect incorporation changes when the precursor was administered through these routes may be partially due to stress caused by intracranial or intravenous injection.—*Journal abstract*.

8951. Edwards, M. J.; Penny, R. H.; Lyle, J. & Jonson, K. (U Sydney, NSW, Australia) Brain growth and learning behaviour of the guinea-pig following prenatal hyperthermia. *Experientia*, 1974, Vol 30(4), 406-407.—Exposed groups of pregnant female guinea pigs to excessive heat (42-43°C) at 3 different stages of gestation. More errors were made by offspring of groups stressed at 20-24 days and at 40-44 days than by controls on nonspatial discrimination reversal tasks at approximately 100 days of age. No differences appeared with the offspring of a group stressed on days 56-60. Whole brain and brain segment weights were lower for heat stressed offspring than for weight-matched controls, suggesting that the deficits in brain size did not result from general body growth retardation. (Germany summary)—C. Wright.

8952. Harrell, L. E. & Balagura, S. (U Massachusetts, Amherst) Influence of ovarian hormones on the recovery period following hypothalamic lesions. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 194-201.—Examined the effects of ovariectomy and its interaction with body weight on the recovery period following lateral hypothalamic lesions. Results in 18 ovariectomized and 24 control female Charles River rats indicate that but set point prior to lesioning, liable to be influenced by hormonal and metabolic factors, was a

more important variable in modifying the recovery process after lateral hypothalamic lesions than was absolute body weight, while absolute body weight determined the amount of weight loss that followed lesions of the lateral hypothalamus. (24 ref)—*Journal abstract*.

8953. Hough, John C.; Ho, George K-W; Cooke, Peter H. & Quadagno, David M. (U Kansas) **Actinomycin D: Reversible inhibition of lordosis behavior and correlated changes in nucleolar morphology.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 367-375.—Actinomycin D (Act D) infused into the preoptic area (POA) of 6 ovariectomized, estrogen-progesterone-primed female Sprague-Dawley rats inhibited sexual behavior and caused nucleolar segregation in neurons. When reprimed with estrogen and progesterone 7 days later the Ss displayed high levels of sexual behavior, and the nucleolar structure was normal. Nucleolar segregation has been related to the inhibition of RNA synthesis. The findings indicate that Act D has a reversible effect on sexual behavior and nucleolar morphology. Data also indicate a correlation between normal levels of sexual receptivity and normal nucleolar morphology. Results, although circumstantial, are consistent with earlier studies indicating that estrogen may stimulate RNA and/or protein synthesis in its facilitation of sexual receptivity in the female rat. (27 ref)—*Journal abstract*.

8954. Howland, B. E.; Beaton, D. B. & Jack, Mary I. (U Manitoba, Winnipeg, Canada) **Changes in serum levels of gonadotropins and testosterone in the male rat in response to fasting, surgery and ether.** *Experientia*, 1974, Vol 30(10), 1223-1225.—Studied male Long-Evans rats divided into groups with  $2 \times 2 \times 2$  factorial combinations of sham castration, fasting, and ether anesthesia as experimental variables. Blood serum was assayed using radioimmunoassay. Results indicate Ss anesthetized with ether had higher ( $P < .05$ ) levels of gonadotropins (LH and FSH) than Ss not exposed to ether. Fasted Ss had lower levels ( $P < .01$ ) of LH and FSH than nonfasted rats, as well as reduced testosterone levels ( $P < .05$ ). Surgery lowered LH levels ( $P < .01$ ) but did not alter FSH or testosterone levels. It is concluded that common procedures used in endocrine studies may affect the hormone levels being studied. (French summary)—*R. Tomasko*.

8955. Kelsey, John E. (Indiana U) **Role of pituitary-adrenocortical system in mediating avoidance behavior of rats with septal lesions.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 271-280.—3 experiments with a total of 186 male Sprague-Dawley rats examined the hypothesis that the effects of septal lesions and systemic injections of scopolamine on avoidance acquisition could be attributed to the effects of either of these treatments on ACTH secretion. Septal lesions and scopolamine facilitated 2-way conditioned avoidance response acquisition, and the lesions retarded passive avoidance acquisition. However, neither the injections of dexamethasone, a synthetic glucocorticoid which inhibited ACTH secretion as did septal lesions, nor injections of ACTH which mimicked the facilitatory effects of scopolamine on basal ACTH secretion, affected avoidance in these paradigms. Thus, the main hypothesis was not supported. The finding that scopolamine

did not affect passive avoidance indicates that a cholinergic system may not be involved in mediating the suppressive effects of punishment. (26 ref)—*Journal abstract*.

8956. Klein, Donald F. (Long Island Jewish-Hillside Medical Ctr, Glen Oaks, NY) **What should the package insert be?** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 735-741.—Considers that the professional and legal status of the package insert needs radical revision. Currently this insert is considered part of drug labeling and must be approved by the Food and Drug Administration (FDA). However, the package insert has achieved, in many physicians' minds, an unwarranted quasi-legal status so that an indication or dosage that is not specifically recommended becomes, by default, experimental or investigational and may open the physician to a charge of malpractice. An alternative format for the package insert is described, with use of a pharmacotherapeutic monograph as a model. A partial example of such a procedure with chlorpromazine is offered.—*Journal abstract*.

8957. Martin, Douglas & Webster, William G. (Carleton U, Ottawa, Ontario, Canada) **Paw preference shifts in the rat following forced practice.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 745-748.—Rats which are forced to reach for food pellets with the nonpreferred paw subsequently show a shift in paw preference. The present study was conducted with 20 experimental and 10 control male albino rats with sections of the corpus callosum, and with 20 experimental and 20 control intact Ss. Results demonstrate that the preference shift occurred regardless of whether the cerebral hemispheres were surgically separated and/or the hemisphere contralateral to the initially preferred paw was functionally depressed during the administration of forced practice training.—*Journal abstract*.

8958. Pearson, J. A. & Vickers, R. A. (U British Columbia, Vancouver, Canada) **Influence of ACTH and adrenal hormones on the amplitude and habituation of the flexor reflex.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 789-793.—Hypothesized that changes in conditioned-reflex habituation would result from experimental manipulation of the pituitary-adrenal axis. Habituation of the flexor reflex was investigated in adrenalectomized male Holtzman rats, demedullated Ss, and Ss which had received injection of ACTH, cortisol, or metyrapone. In none of these circumstances was the degree of habituation significantly different from that in control Ss. It is concluded that if extinction and habituation are due to a common mechanism, then an additional mechanism, which is sensitive to changes in ACTH and corticosteroids, must be postulated for extinction but not for habituation. The magnitude of flexor reflexes was lower in adrenalectomized than in control Ss. Administration of ACTH or cortisol caused elevation of response, whereas metyrapone had no effect. There was no difference between the responses from adrenalectomized Ss and those from demedullated Ss. From these data, the tentative conclusion is made that the amplitude of flexor responses is related to adrenal medullary catecholamines rather than to corticosteroids or ACTH. 8959. Pendse, G. S. (Indian Drugs Research Assn, Drug Research Lab, Poona) **A note on new chemical compounds isolated from a fungus hitherto unknown.** *Experientia*, 1974, Vol 30(1), 107-108.—Describes the isolation of a new compound, Paspaline-P, closely related to the cytochalasins. It was isolated from the *Phomopsis paspali* fungi, hosted by the *Paspalum scrobiculatum* (an Indian food grain).

8960. Pfaff, Donald W. & Lewis, Catherine. (Rockefeller U, New York, NY) **Film analyses of lordosis in female rats.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 317-335.—Studied the responses of 18 ovariectomized female Sprague-Dawley rats, subcutaneously injected with estradiol benzoate daily and with progesterone 2-6 hrs before testing, to 18 sexually experienced male Ss. Descriptions are presented of the males and females during the initiation of lordosis by the female, using observations with films taken from a side or ventral view. Where possible, behavioral events are described objectively, quantified, and plotted as a function of time. Responses of receptive and unreceptive females to mounts by the male are compared.—*Journal abstract*.

8961. Pietras, Richard J. & Wenzel, Bernice M. (U California, Medical School, Los Angeles) **Effects of androgens on body weight, feeding, and courtship behavior in the pigeon.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 289-302.—In 5 experiments adult male pigeons, 7 sham-operated and 29 castrated in adulthood, were housed in individual cages kept in an isolated room with temperature and lighting controlled. Weekly measurements were made of ad lib food intake and body weight for 4 mo after surgery. Castration was followed by a significant depression in body weight and by initially depressed but then progressively enhanced feeding. Food deprivation elicited an increase in food intake proportional to body weight loss, but castrates consumed less food at 100, 90, and 80% of ad lib feeding weight than either intact Ss or castrates treated daily with testosterone propionate (TP). Castrates gained weight and ate more than controls in response to daily intramuscular treatments with TP or 5 $\alpha$ -dihydrotestosterone (DHT, 6 mg/400 g), while androstenedione and androstosterone were ineffective. Administration of 100 mg of DHT subcutaneously to castrates produced a significant enhancement of body weight without elevating the level of food intake. The biological potency of these diverse androgens on male courtship behavior was reciprocal to that for weight-promoting potency. Results suggest that the structural requirements of the androgen molecule for promoting body weight differ from those for stimulating sexual behavior. (34 ref)—*Journal abstract*.

8962. Riege, Walter H. & Cherkin, Arthur. (VA Hosp, Sepulveda, CA) **Sensitive period for reversal of carbon-dioxide amnesia in goldfish.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 477-490.—In 3 experiments spontaneous upstream swimming of goldfish ( $N = 1118$ ) into a quiet well was suppressed in 1 training trial by brief electric shock. Posttraining treatment with normoxic carbon dioxide (CO<sub>2</sub>) solution (saturated with 80% CO<sub>2</sub>: 20% O<sub>2</sub>) produced retrograde amnesia; the extent depended upon the duration of CO<sub>2</sub> treatment (.5-32 min) and the training-CO<sub>2</sub> treatment

interval (.5-256 min). CO<sub>2</sub>-induced amnesia was reversed by treatments previously found to enhance retention retroactively. Complete reversal of amnesia was observed when a retention-enhancing temperature shift (a 4-min abrupt shift from 25 to 10 to 25°C) closely preceded (-8 min) or followed (+8 or +16 min) the CO<sub>2</sub> treatment within the 1st 2 hrs after training. Beyond this sensitive period enhancing treatments were ineffective; a delay of 64 min between CO<sub>2</sub> treatment and temperature shift weakened the reversal effect. Both treatments, alone or in combination, had no effect upon upstream swimming performance of noncontingently shocked controls. The time constraints for the posttraining amnesia reversal implicate processes involved in the consolidation of the memory trace. (50 ref)—*Journal abstract*.

8963. Routtenberg, Aryeh; George, Del R.; Davis, Leonard G. & Brunngraber, Eric G. (Northwestern U, Cresap Neuroscience Lab) **Memory consolidation and fucosylation of crude synaptosomal glycoproteins resolved by gel electrophoresis: A regional study.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 461-475.—36 male Holtzman albino rats were assigned to 1 of 3 training conditions: control, footshock only, and learning a simple withdrawal from footshock by climbing on a safe platform. Ss were injected intraperitoneally with <sup>3</sup>H-fucose prior to training condition. At various intervals after training the delipidated P2 fraction of Whittaker was prepared from the temporal cortex, hippocampus, caudate-putamen, and cerebellum of each S. Gel electrophoresis was carried out using a 3-layered discontinuous polyacrylamide-SDS system. It was found that, as a function of training condition, there were (a) no differences in any gel region in percentage of total protein determined densitometrically; (b) a region 4 mm into the gel and 22 mm into the gel where, as a function of training condition, statistically significant differences in the caudate-putamen but not the other 3 regions were observed in percentage of <sup>3</sup>H-fucose incorporation; (c) a region 26 mm from the origin where <sup>3</sup>H-fucose incorporation differences as a function of training were observed in temporal cortex only; and (d) no effects of training on <sup>3</sup>H-fucose incorporation in hippocampus or cerebellum. Results indicate that quantitative changes occur in particular brain regions in the rates of <sup>3</sup>H-fucose turnover of glycoproteins of particular molecular weight range after a training experience. (41 ref)—*Journal abstract*.

8964. Scouten, Charles W.; Grotelueschen, Linda K. & Beatty, William W. (North Dakota State U) **Androgens and the organization of sex differences in active avoidance behavior in the rat.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 264-270.—Performed 3 experiments to clarify the role of androgens in the development of sex differences in the acquisition of active avoidance behavior in a total of 248 male and 231 female Holtzman albino rats. Gonadectomy in adulthood did not affect the performance of either sex regardless of the length of the postoperative recovery interval. Neonatal castration also failed to improve the avoidance performance of males, but prenatal exposure to the antiandrogen cyproterone acetate combined with neonatal gonadectomy produced males whose avoidance acquisition and open field activity scores were indistin-

guishable from those of control females. Prenatal exposure to endogenous androgens was sufficient to organize the avoidance behavior characteristic of normal males, but there is no compelling evidence that exposure to androgens during the prenatal period was critical to this effect.—*Journal abstract.*

8965. **Snowdon, Charles T.** (U Wisconsin, Madison) **Production of satiety with small intraduodenal infusions in the rat.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 231-238.—9 male Sprague-Dawley rats equipped with chronic intragastric and intraduodenal catheters received small infusions of various solutions through 1 catheter during spontaneous meals. Regardless of which compartment or which solution was infused, the Ss maintained a constant daily nutrient intake. However, all hypertonic solutions reduced mean meal size and increased the frequency of feeding when injected intraduodenally, while only nutritive solutions reduced mean meal size when infused intragastrically. Water ingestion varied with the effective osmotic pressure of the injected solutions, but there were no differences in water ingestion as a function of the compartment infused. Data suggest both the presence of a duodenal satiety mechanism and the validity of interpreting the meal patterns of vagotomized Ss eating a liquid diet as resulting from the rapid emptying of the diet into the duodenum. (18 ref)—*Journal abstract.*

8966. **Södersten, P.** (Stanford U) **Mounting behavior in pregnant and pseudopregnant female rats.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 345-354.—In 2 experiments with a total of 108 female Wistar rats, mounting behavior by Ss with regular 4-day estrous cycles was significantly reduced after the induction of pregnancy, pseudopregnancy, or subcutaneous treatment with progesterone. The mounting behavior shown by pseudopregnant Ss was comparable to that shown by ovariectomized Ss. Pseudopregnant and unmated Ss showed mounts with pelvic thrusting with the same frequency after treatment with estradiol benzoate (EB). EB stimulated the display of mounts with pelvic thrusting in ovariectomized Ss, and this behavior was not affected by concurrent progesterone treatment. It is suggested that the reduction of mounting in pregnant and pseudopregnant female rats is due to decreased ovarian estrogen secretion. (20 ref)—*Journal abstract.*

8967. **Wade, George N.** (U Massachusetts, Amherst) **Some effects of ovarian hormones on food intake and body weight in female rats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 183-193.—Conducted 3 experiments with a total of 63 ovariectomized and 41 ovariectomized-adrenalectomized Sprague-Dawley rats in which ovarian steroids affected food intake and body weight. These effects were probably mediated by estradiol and progesterone, since these 2 hormones were more effective than their principal metabolites (estrone and 5 $\alpha$ -pregnane-3, 20-dione, respectively) in altering the food intake and body weight of ovariectomized Ss. Estradiol seemed to affect food intake by lowering the set point about which body weight is regulated in a dose-dependent fashion. These actions of estradiol could be attenuated or completely blocked by concurrent injections of progesterone. Estradiol-treated ovariectomized Ss were

far more responsive to the weight- and appetite-promoting actions of progesterone than were ovariectomized-adrenalectomized Ss, suggesting that the principal action of progesterone on energy balance may be to interfere with the effects of estradiol. (30 ref)—*Journal abstract.*

8968. **Whalen, Richard E. et al.** (U California, Irvine) **Studies on the effects of intracerebral actinomycin D implants on estrogen-induced receptivity in rats.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 337-343.—In 3 experiments ovariectomized female Sprague-Dawley rats were injected subcutaneously with estrogen and progesterone, and actinomycin D was implanted into different brain areas. Implants of actinomycin D inhibited estrogen-induced lordosis behavior when applied to the preoptic region within 12 hrs of estrogen treatment regardless of whether the interval between implantation and testing was 29, 38, or 68 hrs. Implants 21 hrs after estrogen treatment were ineffective. Attempts to localize the site of action showed that implants into the preoptic region were effective even when the implant cannulae did not pierce the ventricles, that implants into the caudate nucleus were ineffective even if the cannulae pierced the lateral ventricles, and that implants into the 3rd ventricle were highly effective in inhibiting lordosis behavior.—*Journal abstract.*

8969. **Yahr, Pauline & Thiessen, D. D.** (U California, Irvine) **Estrogen control of scent marking in female Mongolian gerbils (*Meriones unguiculatus*).** *Behavioral Biology*, 1975(Jan), Vol 13(1), 95-101.—Ovarian hormones control a species-specific scent marking behavior displayed by female Mongolian gerbils. The present studies examined steroid induction of scent marking in 15 female gerbils that regularly displayed the response prior to treatment and in 28 Ss that rarely or never scent marked. In Ss that regularly scent marked preoperatively, marking behavior and scent gland size decreased after ovariectomy and were reinstated by subcutaneous estrogen given alone or with progesterone. Steroid injections did not stimulate scent marking in ovariectomized females that scent marked very seldom preoperatively, although the hormones promoted gland growth. In contrast to other studies, estrogen and estrogen plus progesterone proved equally effective in all cases.—*Journal abstract.*

### Brain & Electrical Stimulation & Lesions

8970. **Asratyan, E. A.** (USSR Academy of Sciences, Inst of Higher Nervous Activity & Neurophysiology, Moscow) **[Effects of limb deafferentation on the performance of conditioned reflexes of different degrees of complexity and precision.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 3-9.—Attempts to clarify the contradictory data and views of different investigators as to the role of afferents of the somatosensory system in different types of acquired motor actions. Experimental findings indicate that the effects of total or partial deafferentation of the paws of dogs on the performance of conditioned reflexes are more serious and prolonged the more complicated and precise the reflexes. The quick disappearance of classical conditioned reflexes and the slow disappearance of instrumental conditioned reflexes are probably explained

by the properties of the functional architecture of the arcs of each reflex. (19 ref)—*J. Larsen.*

8971. Boyle, Peter C. & Keesey, Richard E. (U Wisconsin, Madison) **Chronically reduced body weight in rats sustaining lesions of the lateral hypothalamus and maintained on palatable diets and drinking solutions.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 218-223.—12 male Holtzman rats sustaining lateral hypothalamic (LH) lesions regulated their body weight at a reduced level when maintained for 1 mo postlesion upon a wet mash diet. Thereafter, for a period of 84 days, half of these Ss were offered a high fat diet, whereas the remaining Ss continued to receive wet mash. A series of palatable drinking solutions were also offered. Body weight remained at reduced levels relative to 8 intake controls regardless of the diet offered, even under conditions of high fluid intake generated by the palatable drinking solutions. Results contradict the interpretation of E. J. Mufson and R. S. Wampler (see PA, Vol 49:428) that the lower body weight observed in LH-lesioned animals is secondary to lesion-produced "finickiness" and/or dehydration resulting from hypodipsia. Rather, a primary shift in the set point for body weight appears to underlie the reduced levels of weight maintenance in LH-lesioned animals. (16 ref)—*Journal abstract.*

8972. Burešová, Olga & Bureš, Jan. (Czechoslovak Academy of Sciences, Inst of Physiology, Prague) **Functional decortication by cortical spreading depression does not prevent forced extinction of conditioned saccharin aversion in rats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 47-52.—In 2 experiments conditioned taste aversion established in Druckrey hooded rats by association of saccharin drinking with subsequent lithium chloride intoxication decreased saccharin intake to 22% of normal consumption. Force-feeding saccharin to intact and functionally decorticate trained Ss returned saccharin consumption on the next day to 62% ( $n = 18$ ) and 77% ( $n = 19$ ), respectively. Overtrained conditioned saccharin aversion was affected by forced extinction in a similar way (saccharin intake increased from 28% to 50% and 63%, respectively). Intact-brain Ss refused to swallow saccharin during forced feeding, while functionally decorticate Ss showed no signs of aversion; extinction was almost equal in both cases. Application of lithium chloride after forced feeding of saccharin in functionally decorticate Ss neither prevented extinction of conditioned taste aversion nor reestablished the aversion habit extinguished earlier with intact brain. It is concluded that acquisition of the conditioned taste aversion requires cortical input to a short-term memory file, whereas decorticate extinction can be induced by subcortical gustatory processing analogous to the mechanism controlling feeding behavior during the preweaning period.—*Journal abstract.*

8973. Butcher, Larry L. & Gan, Jennifer. (U California, Los Angeles) **Effects on precise motor responding of bilateral intrastriatal application of dopamine.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 533-539.—Bilateral intrastriatal administration of dopamine (200  $\mu$ g over 2 hrs) in iproniazid-treated male Sprague-Dawley rats produced stereotyped movements of the jaws and

forelimbs. In an experimental situation specifically designed to measure behaviorally the analog characteristics of motor responses, these Ss displayed oscillatory, choreiform-like response patterns. This motor symptomatology was not observed after intrastriatal application of dopamine or noradrenaline alone, or after intracortical administration of dopamine. It is concluded that increments in striatal dopamine may be correlated with the production of chorea and related reiterative motor processes.—*Journal abstract.*

8974. Calhoun, Karen S.; Prewett, Michael J.; Peters, R. Douglas & Adams, Henry E. (U Georgia) **Factors in the modification by isolation of electroconvulsive shock-produced retrograde amnesia in the rat.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 373-377.—Cites earlier research which demonstrated that placing rats in a sensory-restricted environment during the electroconvulsive shock (ECS) retention interval following 1-trial appetitive learning will prevent or eliminate ECS-produced retrograde amnesia. Exp I replicated this finding using 32 male Dublin albino rats in a 1-trial aversive learning task, indicating that this effect is not task specific. Exp II attempted to determine whether illumination or the restricted environment was the crucial factor in this phenomenon. 64 male Sprague-Dawley rats placed in the light during the ECS-retention interval, whether restricted or in the colony, demonstrated retrograde amnesia after ECS. However, Ss left in the dark during this interval demonstrated little, if any, retention deficit particularly if this condition was combined with sensory isolation. These studies further indicate that manipulation of S's general environment after ECS can alter ECS-produced retention losses.—*Journal abstract.*

8975. Crowley, William R.; Ward, Ingeborg L. & Margules, D. L. (Rutgers State U, Inst of Animal Behavior) **Female lordotic behavior mediated by monoamines in male rat.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 62-68.—In Exp I direct application of serotonergic or  $\beta$ -adrenergic receptor blockers to anterior or posterior areas of the hypothalamus induced lordosis in 18 intact estrogen-primed male Sprague-Dawley rats. Such treatment with an  $\alpha$ -adrenergic blocker or systemic administration of progesterone failed to increase lordosis. In Exp II ( $n = 7$ ) centrally elicited lordosis did not occur without estrogen priming. It is concluded that anatomical and neurochemical similarity may exist in the brain mechanism mediating lordotic behavior in male and female adult rats. (36 ref)—*Journal abstract.*

8976. de Castro, John M. & Marrone, Babetta L. (Georgia State U) **Effect of fornix lesions on shock-induced aggression, muricide and motor behavior in the albino rat.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 737-743.—In Exp I a substantially lower fighting frequency was observed in shock-induced aggression in 10 fornix-lesioned male Holtzman rats as compared to 8 sham-operated controls. Exp II attempted to relate this low fighting frequency to a lesion-induced decrease in motor responsivity and also to determine whether another form of aggressive behavior, muricide, was affected by damage to the fornix. A battery of motor tests revealed a deficiency in motor responsivity which

coexisted with low shock-induced fighting frequencies in 8 lesioned Ss, compared to 20 controls. Muricidal behavior was not affected. In Exp III with 8 lesioned and 12 control Ss, no changes in shock-induced fighting frequencies were found in Ss which had previous experience with this form of aggression, despite significant changes in motor responsivity. Results indicate that the hippocampus affected motor behavior through the extrapyramidal motor system and played a substantial role in shock-induced fighting behavior. It is concluded that the effects of fornix lesions on aggressive behavior and motor ability are independent phenomena. (20 ref)—*Journal abstract*.

8977. Dean, P. (U Oxford, England) **Choice reaction times for pattern discriminations in monkeys with inferotemporal lesions.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 465-476.—Measured the choice reaction times of 3 rhesus monkeys with inferotemporal lesions for the performance of learned pattern discriminations. A titration schedule was used to make the Ss respond as rapidly as possible. Although all 3 inferotemporals were impaired at learning the pattern discriminations, 2 were able to perform them as fast as 3 Ss with superior temporal lesions and 3 normal Ss. It is suggested that the behavior of the 3rd may have been caused by invasion of foveal prestriate cortex, and that the results of the other 2 do not support the hypothesis that inferotemporal removal produces a defect in pattern perception. This is consistent with other experiments demonstrating normal perception in inferotemporal animals. (French & German summaries) (38 ref)—*Journal abstract*.

8978. Denisova, A. S. (USSR Academy of Sciences, Pavlov Inst of Physiology, Leningrad) **[Differentiation and extinction inhibition in dogs after lesion of the caudate nuclei.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 54-59.—Evoked alimentary secretory conditioned reflexes in 7 dogs. Differentiation inhibition was disturbed after lesion of the head of the caudate nuclei, in all Ss regardless of the site of the lesion. Extinction inhibition was disturbed only after lesion of the dorsal part of the head of the caudate nuclei at the rostral level. Results show that the caudate nuclei, and not the cerebral cortex alone as had been postulated, participated in the formation of differentiation and extinction inhibition. (19 ref)—*English abstract*.

8979. Durinyan, R. A.; Reshetnyak, V. K. & Rabin, A. G. (USSR Academy of Medical Sciences, Inst of Normal & Pathological Physiology, Moscow) **[Effects of stimulation of somatic cortical areas in unrestrained cats.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 109-115.—Studied corticofugal effects of stimulation of the 1st and 2nd somatosensory cortical areas in 11 unrestrained cats, and their behavioral reactions during the stimulation. An "attention reaction" was frequently caused by repetitive stimulation of the 2nd somatosensory area, but stimulation of the 1st area produced no visible reactions. (29 ref)

8980. Eviatar, L.; Eviatar, A. & Naray, I. (Bronx-Lebanon Hosp Ctr, NY) **Maturation of neurovestibular responses in infants.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 435-446.—Full-term and preterm babies, divided according to birthweight into small (SGA), appropriate (AGA), and large (LGA)

for gestational age, were tested for nystagmus by per-rotatory stimulation (using a torsion swing) and ice-cold caloric stimulation. 83% of AGA and 24% of SGA babies responded with nystagmus to torsion swing; 69% of AGA and 26% of SGA babies to caloric irrigation. None of the preterm babies responded to vestibular stimulation. (German, French & Spanish summaries) (30 ref)—P. W. Pruyser.

8981. Gandelman, Ronald & Svare, Bruce. (Rutgers State U, New Brunswick) **Mice: Pregnancy termination, lactation, and aggression.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 397-405.—Conducted 2 experiments with a total of 154 female Rockland-Swiss albino mice. Hysterectomy on the 14th day of gestation in combination with the immediate and repetitive presentation of 1-day-old foster young produced lactation and fighting behavior toward adult males. The fighting behavior was comparable to that displayed by normally parturient Ss. Hysterectomy alone or the presentation of pups alone initiated neither lactation nor fighting. Hysterectomy performed prior to the 12th day of gestation plus the presentation of foster young also did not initiate lactation or fighting. Ovariectomy performed in conjunction with hysterectomy on the 14th day of pregnancy together with the presentation of young produced lactation but not fighting behavior, thus suggesting that fighting and lactation are controlled by somewhat different hormonal mechanisms.—*Journal abstract*.

8982. Gavrilo, L. N. (USSR Academy of Medical Sciences, Inst of Experimental Medicine, Leningrad) **[Taste sensitivity and the dynamics of conditioned and unconditioned salivation after unilateral ablation of thalamic nuclei in dogs.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 46-53.—Carried out unilateral electrocoagulation of the sensory taste thalamic nucleus (STN) and other associative and nonspecific nuclei with direct afferents from different levels (the medulla, thalamus, and orbital cortex) of the ascending taste pathway in 11 dogs. Coagulation led to impairment of taste sensitivity for 6-8 wks, tested by feeding meat and rusk powder dissolved in .03, .05, and .06 M quinine solutions. It also changed the dynamics of unconditioned salivation without substantially altering the total amount of secretion. The indicated changes were evident chiefly after ablation of the STN and to a lesser degree after ablation of other nuclei. Ablation of the nuclei of the anterior thalamic parts and the reticular nucleus did not perceptibly influence taste sensitivity and the dynamics of salivation, although it was accompanied by a diminution of the total amount of secretion. (39 ref)—*English abstract*.

8983. Glick, S. D. & Marsanico, R. G. (Mt Sinai School of Medicine, City U New York) **Time-dependent changes in amphetamine self-administration following frontal cortex ablations in rats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 355-359.—Conducted 2 experiments with a total of 28 operated, 25 sham-operated, and 21 normal female Sprague-Dawley albino rats. Ss were trained to intravenously self-administer dextroamphetamine (.01 mg/kg per reward infusion) during daily 1-hr testing sessions. Following removal of frontal cortex, rates of dextroamphetamine

self-administration were higher at early (3-5 days) postoperative intervals but lower at later (2-4 wks) postoperative intervals. These and other results indicate that, as a function of time after surgery, frontal Ss were first hyposensitive and then became increasingly hypersensitive to the rewarding effect of dextroamphetamine. —*Journal abstract.*

8984. Gold, Richard M. & Kapatos, Gregory. (U Massachusetts, Amherst) **Delayed hyperphagia and increased body length after hypothalamic knife cuts in weanling rats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 202-209.—In 2 experiments a total of 23 4-wk-old female Carworth albino rats received parasagittal hypothalamic knife cuts. 11 Ss served as sham-operated controls. Polydipsia began in the experimental Ss right after surgery, but hyperphagia, obesity, and excessive nose-anal length did not begin until after the Ss were 7-8 wk old. The delayed onset appears to await some maturational event that is required for the expression of hypothalamic obesity. It appears likely that puberty is the critical maturational event. (49 ref)—*Journal abstract.*

8985. Goldstein, Melvin L. (Indiana U, Kokomo) **The effect of amygdectomy on acquisition of a classically conditioned fear response.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 465-466.—In an experiment with male albino Holtzman rats, 4 Ss were subjected to bilateral amygdectomy, and their performance latencies on acquisition of the classically conditioned fear response were compared with the performance of 4 normal Ss. Bilateral amygdectomy interfered with acquisition of a classically conditioned fear response. Amygdectomy also reduced the general level of activity. The amygdaloid complex is, therefore, essential for the acquisition of fear-motivated behaviors. This finding is consistent with the results obtained for other fear-motivated behavior such as active avoidance. It is concluded that the specific structures which are essential for the acquisition of a classically conditioned fear response need further investigation.—*Journal abstract.*

8986. Gromova, E. A. & Gil'man, I. M. (USSR Academy of Medical Sciences, Inst of Normal & Pathological Physiology, Moscow) **[The influence on the cerebral cortex of application of serotonin to hypothalamic structures.]** (Russ) *Zhurnal Vyshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 158-164.—Studied, in 9 grown unanesthetized cats with electrodes and cannulae implanted in the brain, the action on the cortex of serotonin, adrenalin, acetylcholine, and eserine applied to different structures of the hypothalamus. 20-40 µg serotonin had a 2-phase effect: a generalized desynchronization and then a synchronization of brain electrical activity, with corresponding shifts of evoked potentials appearing in response to photic stimulation. In Phase 1, Ss exhibited reactions of alertness and restlessness without motor activity; in Phase 2, sleep often developed. The most pronounced effects of serotonin were recorded after it was applied to the structures of the posterior hypothalamic-mamillary complex. It is suggested that the intensity of exchange and biosynthesis of serotonin in the hypothalamic area of the brain is one of the mechanisms for regulating the cortical activity level

and thus the sleep and alertness cycle. (30 ref)—*English abstract.*

8987. Horch, K. (U Utah, Medical Ctr) **Barth's myochordotonal organ as an acoustic sensor in the ghost crab, *Ocypode*.** *Experientia*, 1974, Vol 30(6), 630-631.—Tested the importance of Barth's organ in intraspecific communication. The organ was shown to be the Ss' only receptor sensitive to high frequency sounds. The organ is believed to be used for detection of acoustic signals, and probably crucial for intraspecific communication among crustaceans.

8988. Hranchuk, Kenneth B. & Webster, William G. (Carleton U, Ottawa, Ontario, Canada) **Interocular transfer of lateral mirror-image discrimination by cats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 368-372.—Interocular transfer of mirror-image discriminations has been shown to be paradoxical in split-chiasm monkeys tested in a lighted Wisconsin General Test Apparatus (WGTA) with 3-dimensional forms, but veridical in split-chiasm cats tested in a darkened 2-choice discrimination box with transilluminated patterns. In the present study, 8 split-chiasm cats showed veridical interocular transfer of a mirror-image and a non-mirror-image discrimination in a WGTA or a 2-choice discrimination box. On the basis of the testing parameters used, it is argued that the discrepancy in the literature arises from a species difference (having a behavioral rather than a gross neurological basis) and not from differences in behavioral testing apparatus or mode of stimulus presentation. (16 ref)—*Journal abstract.*

8989. Johnston, V. S.; Hart, M. & Howell, W. (New Mexico State U) **The nature of the medial wall deficit in the rat.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 497-504.—In 2 experiments, spatial and temporal (go-no-go) alternation tasks were run in a computerized Y-maze apparatus in an attempt to characterize the behavioral deficit which resulted from frontopolar ( $N = 11$ ) and medial cortex lesions ( $N = 11$ ) in male hooded and albino rats. The medial cortex lesions caused a severe behavioral impairment on both tasks. The deficit is characterized as an inability to temporally organize recent events. This interpretation is consistent with theories of primate frontal lobe function based on similar data obtained in nonhuman primates and man. (French & German summaries) (21 ref)—*Journal abstract.*

8990. Kadobayashi, Iwao & Nakamura, Michihiko. (Kyoto Prefectural U of Medicine, Japan) **Modification of visual, auditory, and somatosensory evoked responses in cortical primary receiving areas by nigral stimulation.** *Experientia*, 1974, Vol 30(3), 260-262.—Investigated the effects of stimulation of the substantia nigra on evoked visual, auditory, and somatosensory responses in 30 cats lightly anesthetized with pentobarbital. Stimuli were a flash from a xenon lamp, a click, and a 1-2 V electrical shock, respectively. Stimulation was effected with stereotactically placed .1-mm insulated stainless steel needles. There was an increased amplitude of primary components of all 3 evoked responses in cortical primary receiving areas. An effect of the conditioning-test interval was also noted. Nigral stimulation alone produced no response. It is concluded that the substantia

nigra has "nonspecific" functions in the brain stem. (German summary) (18 ref)—C. Wright.

8991. Kalashnikova, N. S. (Medical Inst, Voroshilovgrad, USSR) [The role of the claustrum in conditioned activity.] (Russ) *Zhurnal Vyshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 76-81.—Electrically stimulated the claustrum in 5 cats, and thus inhibited conditioned alimentary motor reflexes. The reflex was inhibited either completely or in its separate links, depending on the moment of stimulation. Lesion and ablation of the claustrum also caused disappearance of the conditioned reflexes, observed for 3-4 wks. (19 ref)—English abstract.

8992. Lanier, Linda P. & Isaacson, Robert L. (U Florida) Activity changes related to the location of lesions in the hippocampus. *Behavioral Biology*, 1975(Jan), Vol 13(1), 59-69.—Studied the effects of dorsal or ventral hippocampal lesions, as related to extent of damage to cytoarchitectural fields, on open-field activity. 30 male Long-Evans hooded rats with dorsal, ventral, or near-total hippocampal damage, 5 Ss with lesions restricted to the neocortex, and 5 operated controls without damage to the brain were given daily 5-min open-field activity tests in 9 postoperative testing sessions. Ss with dorsal or near-total hippocampal damage had significantly more destruction of CA1 fields than Ss with ventral hippocampal damage. In contrast, Ss with ventral or near-total hippocampal damage had significantly more damage to CA3 fields than Ss with dorsal damage and were significantly more active than the other groups. However, results of within-group correlational analyses indicate that differential CA field destruction was not correlated with open-field activity. (19 ref)—Journal abstract.

8993. Leith, Nancy J. & Barrett, Robert J. (Vanderbilt U, Medical School) Effects of hippocampal microinjections of  $\alpha$ -amphetamine and scopolamine on active avoidance behavior in rats. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 285-299.—100 male Sprague-Dawley rats received bilateral injections of 20 or 40  $\mu$ g of dextroamphetamine or scopolamine into the dorsal or ventral hippocampus prior to each of 8 daily training sessions in a discriminated Y-maze active avoidance task. Scopolamine, but not dextroamphetamine, facilitated avoidance responding in both sites, with the effect being greatest following administration of 20  $\mu$ g into the dorsal hippocampus. On Days 9 and 10, all Ss received saline injections and were tested for transfer of responding to the nondrug state. A decrement of performance occurred irrespective of whether the drug had facilitated avoidance responding. The performance changes were greater following termination of scopolamine than dextroamphetamine injections, and in no case were so great as those previously reported following peripheral injections of the drugs. (53 ref)—Journal abstract.

8994. LeVere, T. E. & Morlock, Gerald W. (North Carolina State U, Raleigh) The influence of preoperative learning on the recovery of a successive brightness discrimination. *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 507-509.—Data from 28 male hooded rats show that the recovery of a successive 2-choice brightness discrimination following posterior

neodecortication was significantly impaired if the reinforcement contingencies of the postoperative task were the reverse of those learned preoperatively. Results replicate a simultaneous 2-choice brightness discrimination.—Journal abstract.

8995. Livesey, P. J. & Rankine-Wilson, J. (U Western Australia, Nedlands) Delayed alternation learning under electrical (blocking) stimulation of the caudate nucleus in the cat. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 342-354.—Of 9 young adult cats with electrodes implanted in the dorsolateral caudate nucleus, 4 had previously reached criterion on a delayed alternation task. Tested under alternating conditions of stimulation and nonstimulation, these 4 Ss showed a significant performance decline with stimulation. When a marker was placed on 1 response panel, performance under stimulation did not decline. Stimulation did not affect the learning of a visual discrimination. The remaining 5 Ss were trained on delayed alternation with alternating stimulation and nonstimulation conditions. Under stimulation, performance remained near chance levels. These Ss were tested on position learning and reversal, and under unilateral stimulation. Results support the view that the caudate nucleus and prefrontal cortex mediate separate aspects of delayed response behavior. (35 ref)—Journal abstract.

8996. Lockhart, Mel & Moore, John W. (U Massachusetts, Amherst) Classical differential and operant conditioning in rabbits (*Oryctolagus cuniculus*) with septal lesions. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 147-154.—12 normal New Zealand white rabbits and 12 with septal lesions received classical differential conditioning of the nictitating membrane response (NMR), followed by auditory generalization tests run in extinction. Although rate of acquisition and asymptotic responding to positive conditioned stimuli did not differ, septals responded more than normals to nonreinforced stimuli. Resultant decrements in differential conditioning could not be attributed to changes in auditory or shock thresholds or to increased spontaneous NMRs. Septals also responded at higher rates in both operant conditioning (barpresses reinforced with food pellets on a variable interval schedule) and extinction sessions. No difference in suppression in a passive avoidance task was found. Results are discussed in relation to R. A. McCleary's (1966) response disinhibition analysis of septal function, and an habituation hypothesis is considered. (31 ref)—Journal abstract.

8997. Malakhovskaya, D. B. (USSR Academy of Sciences, Sechenov Inst of Evolutionary Physiology & Biochemistry, Leningrad) [Effect of cortical divaricate depression on the conditioned cleaning reflex in young rabbits.] (Russ) *Zhurnal Vyshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 89-96.—Evoked a conditioned cleaning reflex in 11 rabbits 10 days old. At the end of the 1st and beginning of the 2nd mo of life, when the reflex had been well stabilized, trepanation holes were made in the occipital-parietal areas, one on each side, to apply a potassium chloride solution to the dura mater. 24-48 hrs after the operation, a training session was carried out during cortical divaricate depression induced by application of the solution (2-25% in different cases).

The spreading of the cortical depression was observed by EEG records from the motor cortex. In all the training sessions made during the divaricate depression, the number of effective trials was considerably reduced. When the depression ended the conditioned reflex was recovered. Results suggest that under normal conditions the reflex is achieved with the involvement of the cerebral cortex. (36 ref)—*English abstract*.

8998. Marshall, Leslie B. & Smith, Orville A. (U Washington, Regional Primate Research Ctr) **Prefrontal control of conditioned suppression and associated cardiovascular variables in the monkey (*Macaca mulatta*)**. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 21-35.—Trained 17 male rhesus monkeys in a discriminated conditioned emotional responses paradigm. The discriminated conditioned response (CR) complex consisted of barpress suppression, increased terminal aortic blood flow, and increased arterial pressure. Barpress suppression and blood-flow responses were temporarily eliminated by single-stage bilateral prefrontal lobectomy but not by extensive posterior cortical ablation, 2-stage prefrontal lobe removal, or 3-stage prefrontal cortical surface ablation. The blood pressure CR was attenuated by almost every surgical operation. The changes in heart rate paralleled changes in general activity. Data indicate that the prefrontal lobes influenced the conditioned suppression of ongoing rewarded behavior and the vascular responses accompanying the suppression. The time course for recovery of the somatic CR after lobectomy differed from those of the cardiovascular CRs. (33 ref)—*Journal abstract*.

8999. Mast, M.; Blanchard, R. J. & Matsumoto, R. (U Hawaii) **Stimulus control of predatory aggression**. *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 454-456.—Results of 2 experiments indicate that in contrast to enucleation or deafening, olfactory bulbectomy increased mouse-killing in male Wistar-derived rats ( $N = 58$ ). Mice coated with lavender oil were killed more frequently by intact rats. Results of these and previous experiments indicate that olfactory bulbectomy releases an inhibition of mouse-killing in the rat, and suggest a specific mechanism for such inhibition.—*Journal abstract*.

9000. Meyer, Cornelius C. (Quinnipiac Coll) **Effects of lesions in the medial preoptic region on precocial copulation in the male chick**. *Hormones & Behavior*, 1974(Dec), Vol 5(4), 377-381.—Male Rhode Island Red  $\times$  White Rock chicks showing androgen-induced precocial copulation to a prone hand were given bilateral electrolytic lesions in the medial preoptic region. Symmetrical lesions ( $n = 16$ ) in the medial preoptic area disrupted copulatory behavior over the 10-day postoperative test period. Asymmetrical or sham lesions ( $n = 12$  and 15, respectively) did not differentially affect copulatory activity. Postoperative records indicated that all Ss showed similar increases in weight gain and comb size.—*Journal abstract*.

9001. Nie, V.; Maccabe, J. J.; Ettlinger, G. & Driver, M. V. (Inst of Psychiatry, London, England) **The development of secondary epileptic discharges in the rhesus monkey after commissure section**. *Electroencephalography & Clinical Neurophysiology*, 1974(Nov), Vol

37(5), 473-481.—9 rhesus monkeys had total or partial division of the forebrain commissures, the massa intermedia of the thalamus, and the posterior commissures. Celluloid caps containing aluminum hydroxide were then placed unilaterally on posterior parietal cortex in 5 Ss. Monthly EEG recordings were taken from all Ss. All 5 Ss with epileptogenic implants showed abnormal spike discharges over the primary hemisphere; in addition, transmitted discharges from the primary to the secondary hemisphere were noted. 4 Ss had unexpected contralateral EEG abnormalities (both ictal and interictal) which were independent in time of primary discharges. In all 4 of these Ss histological findings indicate complete division of the corpus callosum, anterior and posterior commissures, and of the massa intermedia. It is suggested that the discharges spread neuronally from the primary to the secondary hemisphere by way of certain remaining pathways. (French summary)—*Journal summary*.

9002. Oke, Arvin F.; Mendelson, Joseph & Justesen, Don R. (VA Hosp, Lab of Experimental Neuropsychology, Kansas City, MO) **Cortical hypothermia is a sequela of electroconvulsive shock**. *Nature*, 1974(Mar), Vol 248(5447), 437-439.—Studied the relationship between amnesia-inducing electroconvulsive treatment (ECT) and cortical hypothermia in 8 mature rats. Ss were implanted with electrodes used both to administer ECT and to record the electrocorticogram. Major findings were that (a) a reversible cortical hypothermia is a consequence of an amnesia-inducing ECT and (b) the hypothermia is associated with an alternation of electrocortical activity. The degree of hypothermia that was exhibited after ECT was less severe than that which has been previously reported as necessary to produce amnesia by partial immersion of the murine animal in cold water.—*R. S. Albin*.

9003. Overstreet, D. H.; Vasquez, Beatriz J. & Russell, R. W. (Flinders U South Australia, School of Biological Sciences) **Reduced behavioural effects of intrahippocampally administered carbachol in rats with low cholinesterase activity**. *Neuropharmacology*, 1974(Nov), Vol 13(10-11), 911-917.—Studied the effects of bilateral hippocampal administration of carbachol on discrete trial single alternation performance in 2 groups of male Sprague-Dawley rats. 6 Ss were examined both before and after chronic treatment with diisopropyl fluorophosphate (DFP), an irreversible anticholinesterase agent, and 6 Ss before and after treatment with its arachis oil vehicle. Initially, carbachol, a cholinomimetic, produced a dose-dependent decrease in the number of reinforced responses in both groups. A similar dose-dependence was found after chronic treatment with arachis oil. However, Ss chronically treated with DFP were unaffected. Results suggest that the sensitivity of cholinergic receptors in the hippocampus may be reduced during chronic treatment with DFP. This reduced sensitivity may be 1 mechanism underlying the development of behavioral tolerance to DFP. (27 ref)—*Journal abstract*.

9004. Rabin, Bernard M. (U Maryland, Baltimore County) **Independence of food intake and obesity following ventromedial hypothalamic lesions in the rat**. *Physiology & Behavior*, 1974(Dec), Vol 13(6), 769-772.

—Lesions of the ventromedial nucleus of the hypothalamus that did not cause overeating caused significantly greater accumulations of body fat in 24 male albino rats maintained on an ad lib diet than in 8 controls. Lesioned Ss that overate showed a still greater percentage of body fat. Results indicate that obesity caused by medial hypothalamic lesions can result from both primary metabolic disturbances and from overeating, and that experimental obesity consistently results from ventromedial hypothalamic lesions independently of the development of hyperphagia. (16 ref)—*Journal abstract*.

9005. Roldán, E.; Alvarez-Pelaez, R. & Fernandez de Molina, A. (Inst Cajal, Madrid, Spain) **Electrographic study of the amygdaloid defense response.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 779-787.—In 14 adult cats with chronic indwelling multiple electrodes, changes in the electrical activity of limbic and hypothalamic structures simultaneous with or following the amygdaloid defense response were assessed. Electrical stimulation of the dorsomedial amygdala consistently elicited a defense response without the simultaneous development of synchronous discharges. High amplitude discharges and afterdischarges recorded from the dorsomedial amygdala following stimulation of the nucleus basalis pars parvocellularis did not necessarily lead to the development of the defense response. Stimulation of the dorsomedial amygdala superimposed on previously elicited afterdischarges produced a defense response associated with a reduction in the amplitude and frequency of the discharges. Results are interpreted in terms of an interfering action of paroxysmal activity on the amygdalo-hypothalamic substrate for the defense response. (50 ref)—*Journal abstract*.

9006. Ruth, Russell E.; Rosenfield, J. Peter; Harris, David M. & Birkel, Paul. (Northwestern U, Cresap Neuroscience Lab) **Effects of aversive and rewarding electrical brain stimulation on auditory evoked responses in albino rat tectum.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 729-735.—Auditory evoked responses in the tectum of 14 Holtzman rats yielded recovery functions to aversive electrical brain stimulation of either contralateral mesencephalic central gray or deep superior colliculus. Effects of stimulation on inferior colliculus auditory potentials were abolished by pentobarbital and curare, implying tympanic muscle mediation due to reticular activation. Brain stimulation effects survived identical pharmacological manipulations when auditory responses were led from deep superior colliculus, showing independence from reticular processes or events occurring in inferior colliculus, 1 synapse previous. Rewarding brain stimulation also affected deep superior colliculus potentials but interacted in an undetermined manner with nonspecific process. (49 ref)—*Journal abstract*.

9007. Schneider, Allen M. (Swarthmore Coll) **Retrograde amnesia and the "reminder effect."** *Science*, 1974(Dec), Vol 186(4169), 1135-1136.—Discusses the explanation, advanced by P. E. Gold et al (see PA, Vol 55:8787), of the mechanism whereby noncontingent footshock (NCFS) restores memory for a learned response in amnesic animals. It is considered possible that Gold et al's learning interpretation of NCFS is

correct, but their experiment does not provide unequivocal support for that notion.

9008. Sclafani, Anthony; Berner, Charles N. & Maul, Glen. (Brooklyn Coll, City U New York) **Multiple knife cuts between the medial and lateral hypothalamus in the rat: A reevaluation of hypothalamic feeding circuitry.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 210-217.—In 2 experiments single or multiple sets of bilateral knife cuts were made in a total of 73 female CFE rats just lateral to the ventromedial hypothalamus (VMH) and/or just medial to the lateral hypothalamus (LH). The lateral VMH knife cuts by themselves produced greater hyperphagia and obesity than did the medial LH cuts. The lateral VMH knife cuts also significantly increased food intake and body weight in Ss previously given bilateral cuts along the medial LH border. Findings indicate that the feeding inhibitory fibers responsible for the hyperphagia syndrome do not project from the VMH to the LH, and this calls for a reevaluation of hypothalamic circuitry. It was also discovered that sham surgery in 7 Ss had a significant suppressive effect on the hyperphagia syndrome produced by hypothalamic knife cuts. (25 ref)—*Journal abstract*.

9009. Sclafani, Anthony; Gale, Steven K. & Maul, Glen. (Brooklyn Coll, City U New York) **The effects of knife cuts between the medial and lateral hypothalamus on feeding and LH self-stimulation in the rat.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 491-500.—9 female CFE strain rats which received bilateral parasagittal knife cuts between the ventromedial (VMH) and lateral hypothalamus (LH) increased their food intake and body weight during a 2-wk postoperative period. The knife-cut Ss did not, however, increase or decrease their LH self-stimulation behavior during this period compared to 6 sham-operated controls. Results question the view that the VMH inhibits the LH but are consistent with the recent suggestion that these hypothalamic areas involve different body-weight setpoint mechanisms. (20 ref)—*Journal abstract*.

9010. Shalyapina, V. G. & Telegdi, G. (USSR Academy of Sciences, Pavlov Inst of Physiology, Leningrad) **[Conditioned activity of rats with serotonin implanted in the amygdaloid complex.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 104-108.—Conducted experiments on a total of 49 male rats (including controls) to study the avoidance reaction after bilateral implantation of serotonin. Implantation in the amygdala inhibited development of the avoidance reaction and depressed its reproduction. Implantation in the cerebral cortex had no substantial influence on conditioned activity. (24 ref)

9011. Shapiro, Sandra; Schuckman, Harold; Sussman, Daniel & Tucker, A. Marie. (Queens Coll, City U New York) **Effects of telencephalic lesions on the gill cover response of Siamese fighting fish.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 749-755.—Gill cover extension, a component of the fighting pattern of Siamese fighting fish, *Betta splendens*, was observed in 7 telencephalic-lesioned and 7 sham-operated Ss during exposure to mirror image and live *Betta* stimuli. The conspecific stimulus elicited more frequent and longer duration gill cover (operculum) responses than the mirror stimulus.

Lesioning decreased the frequency of gill cover responses to both stimuli. The mean duration of the gill cover response was not affected by lesioning and, unlike response rate, did not decrease (habituate) with repeated stimulus presentation. Lesioning reduced the efficiency of food retrieval and tended to reduce activity level. It is concluded that behavioral changes may be related to the extent of the lesion. Results are discussed in relation to current hypotheses concerning forebrain function. (29 ref)—*Journal abstract*.

9012. Sherman, S. Murray. (U Virginia, Medical School) **Monocularly deprived cats: Improvement of the deprived eye's vision by visual decortication.** *Science*, 1974(Oct), Vol 186(4160), 267-269.—Tested 3 monocularly deprived cats for visual perimetry before and after visual cortex lesions. Such a lesion greatly enhanced the deprived eye's performance and impaired that of the nondeprived eye so that the pronounced preoperative interocular asymmetry was lost postoperatively. Apparently this destruction of abnormal corticocortical pathways allows the expression of previously suppressed, normal retinotectal pathways. (26 ref)—*Journal abstract*.

9013. Simpson, C. W.; Baile, C. A. & Krabill, L. F. (State University Coll New York, Brockport) **Neurochemical coding for feeding in sheep and steers.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 176-182.—Feeding responses of 8 sheep (wethers) and 8 steers were compared following intraventricular injection of  $\alpha$ -adrenergic agonists and antagonists in 2-hr tests. In sheep, injection of the  $\alpha$ -agonist levonorepinephrine (L-NE) (140-1,120 nmoles) increased feed intakes 288% and 388% compared with intakes following synthetic cerebrospinal fluid. This response was blocked by the  $\alpha$ -antagonist phenoxybenzamine, whereas the antagonist alone decreased feed intake. The  $\alpha$ -adrenergic antagonist propranolol did not modify the L-NE response. A purer but weaker  $\alpha$ -agonist levophenylephrine, also resulted in increased feed intake that was blocked by phenoxybenzamine. In contrast to the feeding responses of sheep, L-NE caused hypophagia in steers, reducing intakes as much as 58% in 2-hr tests over doses ranging 42-27,800 nmoles. Phenoxybenzamine blocked the L-NE-induced hypophagia in steers; when injected alone, it increased feed intakes 181% of control values. Changes in feeding following L-NE injections are probably not attributable to changes in temperature, fat mobilization, or stupor. Data support the hypothesis of an  $\alpha$ -adrenergic-coded system for feeding in sheep and for satiety in steers. (24 ref)—*Journal abstract*.

9014. Sitdikova, V. V. (USSR Academy of Sciences, Pavlov Inst of Physiology, Leningrad) **[Influence of electrical stimulation of the hippocampus on defensive shaking-off conditioned reflexes during development in rabbits.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 68-75.—Stimulated the dorsal hippocampus in 19 rabbits, changing the course of defensive shaking-off conditioned reflexes. In young Ss (1 and 3 mo), the stimulation only facilitated the defensive reflexes, regardless of the intensity of the current. This was shown by the considerable increase in the number of shaking movements in response to the positive signal. In 6-mo-old Ss, an inhibitory influence

was observed along with the facilitating effect. The differentiation reflex was disinhibited after stimulation of the hippocampus only in 4-wk-old Ss, remaining unchanged in 3- and 6-mo-old Ss. (35 ref)—*English abstract*.

9015. Slotnick, Burton M. & Nigrosh, Barry J. (American U) **Maternal behavior of mice with cingulate cortical, amygdala, or septal lesions.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 118-127.—Evaluated nest building, pup retrieving, and pup survival and growth in 11 primiparous female CF-1 strain mice and in 36 others with cingulate cortical, neocortical, amygdala, or septal lesions. Ss with neocortical or amygdala lesions showed little or no deficits in maternal behavior. Ss with septal lesions were severely impaired in all aspects of maternal care. These did not build nests, showed a variety of aberrant behaviors during pup retrieving, and their pups died or gained significantly less weight than those of controls. Ss with cingulate cortical lesions retrieved pups more slowly than controls, and retrieving deficits were correlated with the extent of retrograde degeneration found in the anterior thalamic nuclei. (26 ref)—*Journal abstract*.

9016. Suvorov, N. F. & Shapovalova, K. B. (USSR Academy of Sciences, Pavlov Inst of Physiology, Leningrad) **[Analysis of the central mechanisms of the instrumental defensive reflex.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 26-36.—Conducted repeated experiments on 7 dogs to study the effect of lesion of the cortical projection areas C<sub>1</sub> and C<sub>2</sub> of the ventroposterior nucleus (VPN) and partial lesion of the posterior nuclear group (PNG) of the thalamus on the formation and perfection of motor instrumental reflexes linked with the maintenance of a certain posture, as well as on the recovery of preliminarily evoked reflexes of this type. VPN and PNG were important in the formation and maintenance of a stable instrumental reaction. Ablation of the same thalamic zones after preliminary evocation and stabilization of reflexes did not bring about any considerable changes in reflexes. More drastic and longer disturbances in evoking instrumental postural tonic reflexes and in their recovery (after preliminary evocation) occurred after ablation of the contralateral somatosensory cortical areas, particularly if the lesion spread to the bottom and walls of the anterior suprasylvian fissure. It is suggested that the evoked postural tonic defensive reaction is fixed bilaterally in the cortical projection areas C<sub>1</sub> and C<sub>2</sub>. (35 ref)—*English abstract*.

9017. Talalaenko, A. N. (Gorky Medical Inst, Donetsk, USSR) **[Neurochemical mechanisms of the inhibitory influence of the hippocampus on the avoidance reaction in rats.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 97-103.—Studied the results of applying gamma-aminobutyric acid (GABA), noradrenaline, serotonin, and their antagonists to the dorsal hippocampus on the latency of the avoidance reaction in 34 male rats. Bioamines and GABA substantially increased reaction latency. The inhibitory influence of noradrenaline on the avoidance reaction was weakened by phentolamine, dehydroergotamine, and chlorpromazine but not by propranolol. The effect of serotonin was eliminated by morphine injected in the

dorsal hippocampus and was not changed by methysergide administration. At the same time, antagonists of serotonin and of the adrenolytics did not prevent the depressing effect of GABA on the avoidance reaction. Results show that the depressing influence of bioamines on the conditioned defensive reflex is achieved through the alpha-adreno- and M-serotonin-sensitive structures of the dorsal hippocampus. The depressive effect of GABA on the avoidance reaction is not due to the action of acid on these receptive structures. (35 ref)—*English abstract*.

9018. Teschke, Eric J.; Maser, Jack D. & Gallup, Gordon G. (Tulane U) **Cortical involvement in tonic immobility ("animal hypnosis"): Effect of spreading cortical depression.** *Behavioral Biology*, 1975(Jan), Vol 13(1), 139-143.—Either 25% potassium chloride (KCl) solution or .9% saline was applied to the surface of the brain of 20 male Sprague-Dawley rats. Ss were restrained on their dorsal surface and duration of the tonic immobility response (animal hypnosis) observed for 20 consecutive trials. Ss that received KCl showed significantly longer durations of tonic immobility than did saline Ss and 4 intact controls. A cyclic pattern of high to low durations was also found. Data support W. R. Klemm's (1971) neural model of tonic immobility which suggests that the neocortex inhibits a brain-stem immobility control center.—*Journal abstract*.

9019. Treichler, F. Robert. (Kent State U) **Two-stage frontal lesion influences upon severity of delayed-response deficit.** *Behavioral Biology*, 1975(Jan), Vol 13(1), 35-47.—33 female rhesus monkeys underwent 1- or 2-stage bilateral aspirative removal of frontal cortical areas after acquisition of 5-sec spatial delayed response. Some Ss were tested for retention as normals, and all were eventually tested under some postoperative condition. Relative to normal retention, 1-stage dorsolateral removals produced severe deficits. 2-stage removals, divided into zones above or below the principal sulcus, generally yielded lesser severity, but this property was also influenced by the order and, to a lesser degree, the extent of these lesions. Some potential bases for the consequences of serial removals are discussed. (16 ref)—*Journal abstract*.

9020. Ursin, Holger & Divac, Ivan. (U Bergen, Inst of Physiology, Norway) **Emotional behavior in feral cats with ablations of prefrontal cortex and subsequent lesions in amygdala.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 36-39.—Bilateral ablations of gyrus preceus in 6 cats did not significantly alter either the intensity or the pattern of flight behavior during confrontation with a human. The scores for defense behavior were reduced in only 2 Ss. Subsequent lesions in the rostral part of the basolateral nuclei of amygdala reduced flight and transiently decreased defense scores in all Ss. It is concluded that the prefrontal cortex does not seem necessary for the flight and defense responding observed in feral cats. The role of amygdala in the regulation of these behaviors is confirmed. (26 ref)—*Journal abstract*.

9021. Wada, Juhn A.; Sato, Mitsumoto & Corcoran, Michael E. (U British Columbia, Div of Neurological Sciences, Vancouver, Canada) **Persistent seizure susceptibility and recurrent spontaneous seizures in**

**kindled cats.** *Epilepsia*, 1974(Dec), Vol 15(4), 465-478.—Daily unilateral electrical stimulation of initially subconvulsive amygdala resulted in progressive development of seizures (kindling) in 21 adult male cats, culminating in generalized convulsive seizures of focal onset that could occur spontaneously. Kindled cerebral epileptogenicity persisted for up to 12 mo and was characterized by both interictal spike discharges of consistent morphology and localization, and an "all or none" response to stimulation at the generalized seizure triggering threshold. Pentyleneetetrazol enhanced the frequency of interictal discharge without changing its localization or morphology, and caused generalized seizures with focal onset exactly like those produced by unilateral stimulation of the amygdala. Findings indicate that repeated electrical stimulation of amygdala produced widespread alteration of brain function resulting in a permanent state of epileptogenicity. Kindling thus qualifies as an experimental model reminiscent of certain types of human epilepsy. (French, Spanish, & German summaries)—*Journal summary*.

9022. Ward, Ingeborg L.; Crowley, William R.; Zemlan, Frank P. & Margules, D. L. (Villanova U) **Monoaminergic mediation of female sexual behavior.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 53-61.—Facilitated lordotic behavior in 18 estrogen-primed ovariectomized female Sprague-Dawley rats by direct application of progesterone or serotonergic or  $\beta$ -adrenergic receptor blockers to specific telencephalic, anterior hypothalamic-medial preoptic, or posterior hypothalamic sites. Blockade of the  $\alpha$ -adrenergic system was ineffective in facilitating lordosis, as was the application of the active drugs to control sites in the thalamus or basal ganglia. Female soliciting behavior was not evoked by any of the treatments. It is concluded that the lordotic behavior component of the female rat's estrous behavior pattern is inhibited by a specific central monoaminergic system that also responds to progesterone. Soliciting behavior appears to be mediated by systems that are anatomically, and possibly neurochemically, separable from those regulating lordosis. (57 ref)—*Journal abstract*.

9023. Webster, Joseph C. & Fox, Kevin A. (State U New York, Medical School, Buffalo) **Diminished aggression by recipients of brain extracts from trained aggressor mice.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 567-571.—The water-soluble fraction from the brains of C57BL/6J male mice which had been trained to a high level of aggressiveness was transferred to untrained Ss of the same sex and strain by subdural injection. An inversion effect was seen wherein the recipients of trained aggressor brain material were significantly less aggressive than were recipients of untrained brain material. Possible causes of these unexpected findings are discussed. (17 ref)—*Journal abstract*.

9024. Whishaw, Ian Q. & Nikkel, Ronald W. (U Lethbridge, Alberta, Canada) **Anterior hypothalamic electrical stimulation and hippocampal EEG in the rat: Suppressed EEG, locomotion, self-stimulation and inhibition of shock avoidance.** *Behavioral Biology*, 1975(Jan), Vol 13(1), 1-20.—Stimulated 101 freely moving male Sprague-Dawley albino rats via electrodes

implanted in the forebrain and brainstem while concurrent hippocampal EEG and behavior were recorded. Stimulation of the preoptic-anterior hypothalamus and lateral hypothalamus produced desynchronization of slow hippocampal EEG but either increased or left fast hippocampal EEG unchanged. Increases in stimulation voltage produced intensity-related decreases in hippocampal EEG amplitude, increases in distance Ss ran, and increases in barpress rates. Stimulation in the medial hypothalamus produced hippocampal rhythmical slow activity, no change in fast activity, stimulus-bound running, and supported self-stimulation. On a jump-avoidance task, anterior and lateral hypothalamic stimulation disrupted performance, while medial hypothalamic stimulation did not. Stimulation of 2 sites in the medial septum and 7 in the dentate gyrus inhibited ongoing movement and depressed amplitude of slow and fast activity. Results suggest that movement inhibition may be related to depression of slow and fast activity, that rewarding properties of stimulation are not necessarily related to either slow or fast hippocampal EEG changes, and that stimulation which produces either rhythmic slow activity or desynchronization can differentially affect performance on a motor task. (45 ref) —*Journal abstract.*

9025. Wilcott, R. C. (Case Western Reserve U) **Skeletal and autonomic inhibition from low-frequency electrical stimulation of the cat's brain.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 487-496.—Results obtained at the head of the caudate nucleus and at parts of the frontal cortex of the cat indicate that these 2 structures are part of a common inhibitory system for both skeletal and autonomic responses. The inhibition of autonomic activity in the cat immobilized by flaxedil suggests that this inhibitory system may have a direct influence on autonomic centers in the brain. (French & German summaries) (22 ref)

9026. Woodruff, Michael L.; Hatton, Daniel C. & Meyer, Merle E. (U Florida) **Hippocampal ablation prolongs immobility response in rabbits (*Oryctolagus cuniculus*).** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 329-334.—Hypothesized that damage to the hippocampus would reduce tonic immobility in rabbits. 2 measures were used with 14 implanted and 6 control Dutch Belt rabbits: the number of successful inductions of tonic immobility in a test session and the duration of each successful immobilization. Both of these measures increased in Ss with hippocampal lesions rather than decreased as expected. It is suggested that the hippocampus may act to suppress any ongoing dominant or prepotent response, whether the response involves movement or cessation of movement. (28 ref)—*Journal abstract.*

9027. Woodruff, Michael L.; Kearley, Richard C. & Isaacson, Robert L. (Middlebury Coll) **Deficient brightness discrimination acquisition produced by daily intracranial injections of penicillin in rats.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 445-460.—12 male Wistar albino rats with unilateral epileptiform foci produced by daily injections of penicillin into either occipital cortex or hippocampus were trained on an operant visual discrimination. Both of the experimental groups were retarded in the acquisition of the discrimination, but the

Ss with foci in the occipital cortex demonstrated a more severe impairment, despite the fact that secondary epileptiform discharges appeared in hippocampus and visual cortex under both conditions. As a control for the nonepileptiform properties of the penicillin, 12 Ss received intracranial injections of sodium sulfadiazine. Ss injected with this drug were not significantly different from 6 normal controls in the percentage of correct responses emitted, despite reduced response rates. After 5-7 days of treatment this drug produced some slight seizure activity which was unrelated to performance. On Day 11 of discrimination training the Ss receiving penicillin were injected with sodium sulfadiazine and the Ss receiving sodium sulfadiazine were given penicillin. The Ss changed from penicillin to sodium sulfadiazine showed an immediate increase in the percentage of correct responses. Ss switched from sodium sulfadiazine to penicillin demonstrated a transitory impairment in performance. Data are interpreted to indicate that epileptiform activity produced by penicillin results in a deficit in retrieval of recently formed memories. (19 ref) —*Journal abstract.*

### Drug Effects

9028. Abreu, Luiz A. & Abreu, R. Raposo. (Inst Oswaldo Cruz, Lab of Biochemistry, Rio de Janeiro, Brazil) **Effect of long term lithium treatment on brain fumarase activity.** *Experientia*, 1974, Vol 30(9), 1056-1057.—Conducted experiments with male Swiss mice to study the mechanism responsible for lithium therapy's effectiveness in treating manic-depressive psychosis. (French summary)

9029. Ahlenius, Sven. (U Göteborg, Sweden) **Effects of low and high doses of L-dopa on the tetrabenazine or  $\alpha$ -methyltyrosine-induced suppression of behaviour in a successive discrimination task.** *Psychopharmacologia*, 1974, Vol 39(3), 199-212.—Studied the effect in male Sprague-Dawley rats of the administration of levodopa on the suppression of a successive discrimination-conditioned avoidance task induced by  $\alpha$ -methyltyrosine methylester hydrochloride ( $\alpha$ -MT) or tetrabenazine (TBZ). All drugs were administered intraperitoneally. Administration of 100 mg/kg levodopa resulted in a reversal of the  $\alpha$ -MT- or TBZ-induced suppression of the avoidance behavior, although the discrimination was lost. Restoration of the avoidance behavior and the correct discrimination were obtained with 10 mg/kg levodopa after  $\alpha$ -MT but not after TBZ. The difference in the behavioral response to levodopa after  $\alpha$ -MT as compared to the response obtained after TBZ is discussed in terms of the availability of the catecholamines formed from levodopa for release by the nerve impulses. Biochemical determinations of brain noradrenaline and dopamine were made in parallel. A simple and reliable method for the acquisition of a successive discrimination in the rat is described. 9030. Askew, W. E. & Ho, B. T. (Baylor Coll of Medicine, Houston, TX) **Effects of tetrahydrocannabinols on cyclic AMP levels in rat brain areas.** *Experientia*, 1974, Vol 30(8), 879-880.

9031. Beleslin, D. B.; Grbović, Leposava & Radmanović, B. Ž. (Medical Faculty, Beograd, Yugoslavia)

The pharmacology of gross behavioural effects of cholinomimetic substances injected into the cerebral ventricles of unanesthetized cats: Evidence for central muscarinic mediation. *Neuropharmacology*, 1974(Dec), Vol 13(12), 1163-1169.—Choline esters (acetylcholine, methacholine, and carbachol) as well as substances with a peripheral muscarinic type of action, such as pilocarpine and arecoline, injected intraventricularly in unanesthetized cats, evoked emotional behavior, autonomic changes, motor phenomena, and clonic-tonic convulsions. The gross behavioral effects of various single doses were dose-dependent. Of choline esters and substances with peripheral muscarinic type of actions that were administered, carbachol was the most potent. Atropine and scopolamine abolished the emotional behavior, autonomic changes, motor phenomena, and clonic-tonic convulsions of choline esters, while only scopolamine antagonized the gross behavioral effects of pilocarpine and arecoline. The excitant behavioral changes of choline esters, pilocarpine, and arecoline were resistant to, and potentiated by, administration of ganglionic or neuromuscular blocking agents. It is concluded that choline esters, applied intraventricularly to unanesthetized cats, elicit excitant behavioral phenomena by an action on central muscarinic cholinergic sites. (34 ref)

—*Journal abstract.*

9032. Beleslin, D. B.; Samardžić, Ranka & Malobabić, Z. S. (Medical Faculty, Beograd, Yugoslavia) An analysis of the gross behavioural changes induced by tetraethylammonium and a comparison with other substances affecting the autonomic and central nervous system after intraventricular injections to conscious cats. *Neuropharmacology*, 1974(Dec), Vol 13(12), 1171-1177.—Tetraethylammonium (TEA, 2-3.0 mg) injected intraventricularly in conscious cats caused dose-dependent emotional behavior, autonomic changes, motor phenomena, and clonic-tonic convulsions. Atropine and scopolamine abolished the emotional behavior but did not antagonize the autonomic and motor changes nor the clonic-tonic convulsions of TEA. Ganglionic and neuromuscular blocking agents, adrenergic blocking drugs, a 5-hydroxytryptamine antagonist, an antihistamine, antiepileptic drugs, calcium chloride, magnesium chloride, chlorpromazine, glycine, and noradrenaline failed to block the gross behavioral effects of TEA. It is concluded that the emotional behavior caused by TEA in conscious cats is mediated through central muscarinic cholinergic sites, probably by enhanced release of acetylcholine. Autonomic changes, motor phenomena, and convulsions are most likely the consequence of TEA's direct actions on the nerve cells. Hexamethonium, nicotine, (+)-tubocurarine, gallamine, atropine, scopolamine, and propranolol evoked excitant behavioral changes similar to those of TEA. Antazoline and magnesium chloride elicited excitant autonomic and motor phenomena followed by sedation and sleep. Noradrenaline and calcium chloride produced only depressant behavioral effects. (26 ref)

9033. Berger, Philip A.; Barchas, Jack D. & Vernikos-Danellis, Joan. (U Stanford) Serotonin and pituitary-adrenal function. *Nature*, 1974(Mar), Vol 248(5447), 424-426.—Studied the relationship between the pituitary

secretion of steroids and brain serotonin in the rat—specifically, the response of the pituitary-adrenal system to a stress stimulus. Brain serotonin synthesis was inhibited with p-chlorophenylalanine or raised with precursors such as tryptophan or 5-hydroxytryptophan. In Exp I, 180 male rats were divided into 2 groups and injected either with saline or with PCPA in saline at a dose of 300 mg. In Exp II, 2 groups of 8 adrenalectomized rats each were stressed with ether 2 hrs after the administration of serotonin precursors, and the pattern of the rise in adrenocorticotrophic hormone was studied. A serotonin pituitary-adrenal relationship was demonstrated.—R. S. Albin.

9034. Bergmann, F.; Chaimovitz, M.; Pasternak, Y. & Ramu, A. (Hebrew U—Hadassah Medical School, Jerusalem, Israel) Compulsive gnawing in rats after implantation of drugs into the ventral thalamus: A contribution to the mechanism of morphine action. *British Journal of Pharmacology*, 1974(Jun), Vol 51(2), 197-205.—Bilateral implantation of apomorphine, morphine, or methadone into the region of the nucleus ventralis of the rat thalamus evoked compulsive gnawing. Chlorpromazine, haloperidol, or pimozide blocked the response to apomorphine and morphine, but pretreatment with  $\alpha$ -methyltyrosine methyl ester or  $\alpha$ -methyltyrosine suppressed only morphine-induced gnawing. Subcutaneous injections of high doses of morphine or pethidine reduced or abolished already established gnawing activity, evoked by intrathalamic deposits of either apomorphine or morphine. Nalorphine, applied subcutaneously, antagonized only the response to morphine. Injections of amphetamine potentiated morphine-induced gnawing. The action of morphine and methadone on the ventral thalamus may therefore be mediated by catecholamines, the drugs causing enhanced biosynthesis and release of these transmitters.—*Journal abstract.*

9035. Berridge, M. J. & Prince, W. T. (ARC Unit of Invertebrate Chemistry & Physiology, Cambridge, England) The nature of the binding between LSD and a 5-HT receptor: A possible explanation for hallucinogenic activity. *British Journal of Pharmacology*, 1974(Jun), Vol 51(2), 269-278.—LSD mimicked 5-hydroxytryptamine (5-HT) in its ability to stimulate fluid secretion, to change transepithelial and intracellular potentials, and to increase the cyclic adenosine monophosphate concentrations of isolated salivary glands of *Calliphora*. Unlike 5-HT, LSD disengaged slowly from the receptor, and fluid secretion continued despite repeated washing. Both 5-HT and tryptamine prevented LSD from acting on the glands. LSD bound to the receptor was slowly displaced when glands were treated with agonists (tryptamine) or antagonists (gramine). The property of LSD which permits it to function as an agonist despite remaining tightly bound to the receptor is discussed as a possible basis for its profound effects within the central nervous system.—*Journal abstract.*

9036. Blum, K. et al. (U Texas, Health Science Ctr, San Antonio) Ethanol narcosis in mice: Serotonergic involvement. *Experientia*, 1974, Vol 30(9), 1053-1054.—Investigated the chemical mechanisms involved in ethanol-induced sleep in 100 albino, male, Swiss-Webster mice. Biogenic amine metabolites, rather than amines

per se, are suggested to be involved in ethanol's sleep mechanism. The synergistic effect of dopamine on ethanol-induced sleep is considered due in part to a serotonergic rather than a dopaminergic mechanism. (German summary)

9037. Breese, G. R.; Cooper, R. R. & Mueller, R. A. (U North Carolina, Medical School, Chapel Hill) **Evidence for involvement of 5-hydroxytryptamine in the actions of amphetamine.** *British Journal of Pharmacology*, 1974(Oct), Vol 52(2), 307-314.—Administration of pargyline 1 hr before injection of dextroamphetamine (1 mg/kg) reduced amphetamine-stimulated motor activity. *p*-Chlorophenylalanine (PCPA) treatment prevented this inhibition. Reduction of brain 5-hydroxytryptamine (5-HT) with PCPA or 5,6-dihydroxytryptamine potentiated the amphetamine-induced locomotor response. This enhanced response to amphetamine following PCPA was reversed by 5-hydroxytryptophan treatment. While amphetamine-induced stereotypies were not altered by PCPA, depletion of 5-HT enhanced the induction of tyrosine-hydroxylase activity produced by amphetamine. The inhibition of amphetamine-stimulated motor activity produced by destruction of catecholamine-containing fibers could not be reversed by treatment with PCPA. —*Journal abstract.*

9038. Brus, R.; Herman, Z. S.; Sokola, A. & Jamrozik, Z. (Silesian School of Medicine, Inst of Biology & Physiology, Zabrze, Poland) **Effect of 6-hydroxydopamine on the duration of hexobarbital sleep in rats.** *Experientia*, 1974, Vol 30(1), 66.—Examined the prolongation of hexobarbital sleep in rats after a chemical sympathectomy of the central nervous system. Implications of the effects of barbiturates on the animal brain are noted. (German summary)

9039. Cappell, Howard & Pliner, Patricia. (Addiction Research Foundation, Toronto, Ontario, Canada) **Regulation of the self-administration of marijuana by psychological and pharmacological variables.** *Psychopharmacologia*, 1974, Vol 40(1), 65-76.—Investigated the roles of 3 variables as determinants of marijuana self-administration. Marijuana-use history was manipulated by selecting 30 18-29 yr old males at each of the 2 extremes of use frequency. To determine the possible contribution of learned smoking habits to consumption, Ss smoked either large or small cigarettes. Finally, cigarettes varying in concentration of  $\Delta^9$ -tetrahydrocannabinol were used. Ss were asked to smoke until they had attained a "nice high." Although there was some evidence of titration according to potency, Ss self-administered more total tetrahydrocannabinol the more potent the material in attaining the same subjective endpoint of intoxication. More material was ingested in the form of large than small cigarettes. The latter variable accounted for nearly as much variance as did drug potency itself. This result illustrates the importance of an essentially cognitive variable as a determinant of drug intake. There was no difference in the amount required by frequent and infrequent users to attain the intoxication criterion. The latter result is in opposition to the assertion by G. H. Nahas (1973) that frequent exposure to cannabis will ultimately result in an increase in the amount required to produce the reinforcing effects of marijuana. —*Journal abstract.*

9040. Carey, Robert J.; Goodall, Edwin & Lorens, Stanley A. (VA Hosp, Syracuse, NY) **Differential effects of amphetamine and food deprivation on self-stimulation of the lateral hypothalamus and medial frontal cortex.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 224-230.—Intracranial self-stimulation of the lateral hypothalamus in 5 male Sprague-Dawley rats was markedly increased by subcutaneous dextroamphetamine administration and by food deprivation. In contrast, similar self-stimulation response rates obtained in the same Ss from the medial frontal cortex were unaffected by food deprivation and only slightly increased by dextroamphetamine administration. Furthermore, a large difference between dextro- vs levoamphetamine on response rate was obtained for lateral hypothalamic but not for medial frontal cortex self-stimulation. Results are consistent with a noradrenergic self-stimulation system for the lateral hypothalamus. Medial frontal cortex self-stimulation, however, appears to be mediated by a neuroanatomical and neurochemical system different from that of the lateral hypothalamus. —*Journal abstract.*

9041. Carlson, R. H.; Sanders, M. G.; Tal, A. & Wood, W. G. (Texas Tech U) **Attenuation of "acute" habituation by scopolamine in the black-tailed prairie dog (*Cynomys ludovicianus*).** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 335-341.—Tested and confirmed the hypothesis that scopolamine attenuates habituation occurring within a training session as well as that occurring between training sessions. Subcutaneous scopolamine injections (.5 mg/kg) reduced spontaneous wheel running in 8 female prairie dogs. The same dosage did not affect the threshold for wheel running induced by electrical brain stimulation (EBS) in 6 Ss in Exp II. Exp III ( $n = 6$ ) demonstrated that EBS-induced running declined during a 10-min stimulation period and indicated that the decline was habituated since the response was repeatedly dishabituated. In Exp IV .5 mg/kg of scopolamine reduced habituation of EBS-induced wheel running during 10-min sessions with the 6 Ss used in Exp II. (22 ref) —*Journal abstract.*

9042. Charness, Michael E.; Amit, Zalman & Taylor, Max. (Johns Hopkins U, Medical School) **Morphine induced stereotypic behavior in rats.** *Behavioral Biology*, 1975(Jan), Vol 13(1), 71-80.—5 groups of 8 male Wistar albino rats each received 5 daily intraperitoneal injections of 3 dose levels (3 mg/kg, 6 mg/kg, and 9 mg/kg) of morphine hydrochloride, 1 dose (10 mg/kg) of amphetamine, or saline. The occurrence of morphine-induced stereotypic behavior was measured and categorized into 3 subtypes. Diurnal influences on stereotypic behavior were also evaluated, and morphine and amphetamine stereotypic behavior was compared. In addition, the effect of haloperidol (a dopamine receptor blocker) on morphine- and amphetamine-stereotypic behavior was assessed. Since tolerance seemed to develop to the motor-depressant effects of morphine, while no increases in stereotypic behavior were observed when it was measured as percentage of active time, it is suggested that tolerance does not develop with respect to stereotypic behavior. It is argued that morphine-induced stereotypic behavior does not seem to be a rebound

phenomenon dependent on the development of motor tolerance. It is suggested that morphine-stereotyped behavior, unlike amphetamine-stereotyped behavior, is not wholly dependent on activity in dopamine pathways.

—*Journal abstract.*

9043. Collier, H. O.; Francis, D. L.; Henderson, G. & Schneider, C. (Miles Lab, Stoke Poges, England) **Quasi morphine-abstinence syndrome.** *Nature*, 1974(May), Vol 249(5456), 471-473.—Induced a quasi-abstinence syndrome in male albino rats previously untreated with any opiates to study the endogenous biochemical process involved in morphine dependence. Assuming that morphine induces dependence in response to continued interaction of the drug with an unidentified biochemical process of neurones, then it was felt that suitable pharmacological manipulation might produce a paradigm of the morphine abstinence syndrome in experimental animals not exposed to any opiate. (The number of rats studied is not reported.) It is concluded that the ability of theophylline to produce quasi-abstinence effects indicates that the cyclic nucleotides may be involved in morphine dependence, and that morphine tolerance and dependence may arise through compensatory changes in processes related to PGE-cyclic adenosine monophosphate interaction.—*R. S. Albin.*

9044. Constantinidis, J. et al. (U Geneva, Switzerland) **Enhancement of cerebral noradrenaline turnover by thyrotropin-releasing hormone: Evidence for fluorescence histochemistry.** *Experientia*, 1974, Vol 30(10), 1182-1183.—Studied the thyrotropin-releasing hormone's activation of noradrenaline neurons in the brain. It is suggested that this effect results in the antidepressant action of the tripeptide in man. (German summary)

9045. Crowley, Thomas J.; Styne, A. J.; Hyding, Marilyn & Kaufman, I. Charles. (U Colorado, Medical Ctr, Denver) **Ethanol, methamphetamine, pentobarbital, morphine, and monkey social behavior.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 829-838.—Reports findings of significant dose-response curves for social behaviors after single-dose administration of drugs in 5 adult male pigtail macaque monkeys living in their "home" troop of about 30 animals. Ethanol (0-2 ml/kg, gavage) produced ataxia without motor slowing, regressive playful fighting typical of juveniles, and a substantial increase in the ratio of heterosexual to autosexual behaviors. Aggressive dominance behavior was not altered. Pentobarbital sodium (0-1 mg/kg, intramuscularly) reduced submission behaviors, increasing the dominance-to-submission ratio. Methamphetamine hydrochloride (0-5 mg/kg intramuscularly) decreased the dominance-to-submission ratio, while producing hyperactivity, stereotypies, and social unrelatedness. Morphine (0-4 mg/kg, intramuscularly) blocked sexual behavior without impairing motor activity. (44 ref)—*Journal abstract.*

9046. Cummins, R. A.; Budtz-Olsen, O. E.; Walsh, R. N. & Worsley, A. (U Queensland, Brisbane, Australia) **Testosterone, early experience and behavioral arousal in a novel environment.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 283-288.—Rhode Island Red chicks were hatched either in isolation or in pairs. On the 2nd day after hatching they were injected intramuscularly with either 0, .5, 1.5, 4.5, or 13.5 mg of testosterone. 2

days later their emotional response to a novel environment was determined by counting the cheeping rate. It was found that, while low doses of testosterone elevated cheeping, the highest doses caused a depression back to or below control levels. The rearing environment also had an effect in that the isolated chicks cheeped more than their social counterparts for every dose except .5 mg. It is concluded that testosterone can influence behavioral arousal in chicks but that the effect is dependent upon both dose and previous environmental experience.—*Journal abstract.*

9047. Damitz, Charles; Tritt, John; Anderson, David & Goldstein, Melvin L. (Indiana U, Kokomo) **The effect of varying the dosage of sodium pentobarbital on the barpress rate of rats.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 471-472.—Determined the dose-response curve for sodium pentobarbital for 3 male albino Holtzman rats performing a simple barpress response for water reinforcement 20 min after having been injected with dosages of sodium pentobarbital ranging from 1.3 to 5.2 mg/kg of bodyweight. Sodium pentobarbital, in the relatively low dosages used, consistently depressed barpress responding. The barpress rate varied directly with the dosage of the drug. It is concluded that the low dosages of the drug used in the present study apparently have a depressant effect on the central nervous system.—*Journal abstract.*

9048. Davies, J. A. & Redfern, P. H. (Welsh National School of Medicine, Cardiff) **The interaction of dopamine-antagonists and amantadine hydrochloride on the acquisition of the conditioned avoidance response in rats.** *Neuropharmacology*, 1974(Nov), Vol 13(10-11), 941-948.—Studied the interaction between amantadine HCl and both pimozide and haloperidol (subcutaneously administered) on the acquisition of the conditioned avoidance response (CAR) by male Sprague-Dawley rats. Pretrial injection of haloperidol or pimozide inhibited the acquisition of the CAR in a dose-dependent manner. Amantadine HCl given 2 hrs after haloperidol or pimozide reversed the inhibitory effects of these drugs on acquisition. The significance of these results is discussed in terms of the role of brain dopamine in learning and memory mechanisms. (19 ref)—*Journal abstract.*

9049. Davies, J. A.; Navaratnam, V. & Redfern, P. H. (U Bath, School of Pharmacy, England) **The effect of phase-shift on the passive avoidance response in rats and the modifying action of chlordiazepoxide.** *British Journal of Pharmacology*, 1974(Jul), Vol 51(3), 447-451.—In rats trained to a 12-hr light-dark cycle, advancing at 12 hrs 00 min produced a resynchronization of the 24-hr variation in passive avoidance response which was completed after 10 days. The attainment of the new steady state was preceded by a period of disruption which was greatest 5 days after phase-shift. The presence of chlordiazepoxide (62.5-500 µg/ml) in the drinking water during the days after phase-shift produced a dose-dependent lessening of the disruptive effect of phase-shift and a more rapid adaptation to the new light-dark cycle. The significance of these results is discussed.—*Journal abstract.*

9050. Decsi, L. & Nagy, Julia. (Medical U, Inst of Pharmacology, Pécs, Hungary) **Chemical stimulation of**

the amygdala with special regard to influence on the hypothalamus. *Neuropharmacology*, 1974(Dec), Vol 13(12), 1153-1162.—4 different parts of the amygdala were chemically stimulated in 72 implanted, awake cats, and the effects on gross behavior, spontaneous electrical activity of the brain, and carbachol-induced hypothalamic emotional reaction were studied. Carbachol-stimulation had no effect on gross behavior. It caused a shift towards high-amplitude slow-wave activity in the EEG pattern and inhibited, in a dose-related manner, the rage reaction evoked by direct carbachol stimulation of the anteriomedial hypothalamus. The effect of carbachol from the central amygdala was blocked by a previous topical application of atropine. Nicotine inhibited the rage reaction only from the lateral part of the amygdala. Noradrenaline, when injected into the lateral or basal amygdala, caused very mild sedation, exhibited EEG effects similar to those seen after carbachol application in the central or lateral part of the amygdala, and inhibited the hypothalamic rage reaction. It is suggested that this action was a beta-receptor effect, for isoprenaline was also effective while phenylephrine and dopamine were not. (21 ref)—*Journal abstract*.

9051. Del Fiacco, M.; Fratta, W.; Gessa, G. L. & T. Diamante, A. (U Cagliari, Inst of Pharmacology, Italy) Lack of copulatory behaviour in male castrated rats after *p*-chlorophenylalanine. *British Journal of Pharmacology*, 1974(Jun), Vol 51(2), 249-251.—Notes that *p*-Chlorophenylalanine (PCPA), a compound which inhibits 5-hydroxytryptamine (5-HT) synthesis, stimulates homo- and heterosexual behavior in male animals. Previous studies have shown that the male-to-male mounting behavior elicited by PCPA is absent in castrated rats and is restored by the administration of testosterone. In the present study the effect of PCPA on the copulatory behavior of male castrated rats with receptive females was studied. Adult male rats, castrated 2 mo previously, failed to mount receptive females. PCPA, given in a dosage schedule which depleted brain 5-HT by 80%, failed to restore copulatory behavior; this behavior was restored by .1 mg/kg testosterone propionate, given subcutaneously.—*Journal abstract*.

9052. Deniker, P.; Ginestet, D. & Peron-Magnan, P. (University-Hosp Service of Mental Health & Therapy, Paris, France) New drug development in France and French-speaking countries: Short and long acting neuroleptics. *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 18-20.—Presents results of uncontrolled evaluations of neuroleptic drugs. Phenothiazines not available in the US, groups of neuroleptics with a new chemical formula, and new long-acting neuroleptics are discussed. The position of French clinicians concerning these drugs is cited.

9053. Foulon, C. (U libre Brussels, Lab de Physiologie, Belgium) [The effect of cycloheximide and actinomycin D on the spontaneous operative behaviors of the pigeon.] (Fren) *Acta Neurologica Belgica*, 1974 (May-Jun), Vol 74(3), 147-154.—Studied the effects of cycloheximide and actinomycin D (daclinomycin) in 3 groups of pigeons (including controls). Results show that in the controls, spontaneous activity increased during trials and learning was rapid, while in Ss treated with cycloheximide, spontaneous activity remained constant

during successive experiments and learning improved slowly, and in Ss given actinomycin D, spontaneous activity gradually disappeared and learning was nonexistent. Findings suggest a parallel between spontaneous and operative (operant?) behavior in control and treated animals. (18 ref)—*English abstract*.

9054. Friedman, E. & Gershon, S. (New York U, Medical Ctr) Effect of  $\Delta^1$ -THC on alcohol-induced sleeping time in the rat. *Psychopharmacologia*, 1974, Vol 39(3), 193-198.—Studied the effect of acute and repeated intraperitoneal  $\Delta^1$ -tetrahydrocannabinol ( $\Delta^1$ -THC) administration on alcohol-induced sleeping time in male Sprague-Dawley albino rats. It was observed that acute pretreatment with  $\Delta^1$ -THC markedly potentiated alcohol-induced sleeping time in a dose-related manner. This potentiation of the alcohol sleeping time was shortened significantly after repeated prior treatment with  $\Delta^1$ -THC and could be observed 72 hrs after chronic treatment. The effect of  $\Delta^1$ -THC on alcohol-induced sleeping time was not associated with an altered alcohol metabolism rate. (17 ref)—*Journal abstract*.

9055. Friedman, Jeanette; Horvath, Thomas & Meares, Russell. (U Melbourne, Vic, Australia) Tobacco smoking and a "stimulus barrier." *Nature*, 1974(Mar), Vol 248(5447), 455-456.—Presents an hypothesis about the nature of the mechanism through which tobacco smoking might be positively reinforced. Ss were 10 men between the ages of 20-25 yrs who habitually smoked at least 1 packet of cigarettes a day. Alpha-desynchronization of the EEG was the aspect of the orienting response studied. The EEG was recorded in a sound-damped room. Subsequent sessions consisted of recording of EEG subsequent to cigarette smoking. During additional sessions, Ss were requested to abstain from cigarettes for 12 hrs; tones were presented both before and after smoking. Results indicate that the immediate effect of tobacco smoking was to greatly increase the speed of habituation, and that placebo smoking had no effect. Theoretical models of the habituation process that help to explain these results are discussed.—*R. S. Albin*.

9056. Garver, David L.; Schlemmer, R. Francis; Maas, James W. & Davis, John M. (Illinois State Psychiatric Inst, Chicago) A schizophreniform behavioral psychosis mediated by dopamine. *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 33-38.—Induced schizophrenic-like behavioral disturbances in 4 selected members of a macaque social colony by the chronic nasogastric administration of dextroamphetamine. Ss showed hyper-vigilance, hyperactivity, fragmented and repetitive behaviors, and progressive social withdrawal as well as the development of solitary stereotypes. The syndrome was dissected pharmacologically with alpha-methyl-para-tyrosine, chlorpromazine, pimozide, and haloperidol. Based on the behavioral findings and the known mechanisms of action of these drugs, it is concluded that the major elements of the psychotic-like behavior induced by dextroamphetamine were mediated by dopamine systems.—*Journal abstract*.

9057. Gates, G. R. & Chen, C. S. (U Monash, Clayton, Vic, Australia) Effects of barbiturate withdrawal on audiogenic seizure susceptibility in BALB/c mice. *Nature*, 1974(May), Vol 249(5453), 162-164.—Presents evidence demonstrating that barbiturate withdrawal in

mice is highly effective in producing audiogenic seizure susceptibility in a strain of mice which are normally resistant to seizure. This barbiturate withdrawal effect is not age-dependent. It is suggested that drug-induced susceptibility to seizure shares features in common with the seizure susceptibility than can be induced in these same mice following a reduction of auditory input. 21 mice from 8 litters were divided into 2 groups (split litters) at approximately 36 days of age. Each of 14 experimental Ss was given an intragastric dose of 1.8 mg of sodium phenobarbitone dissolved in 0.3 ml of water twice daily. The other group of 7 Ss was also given the same dose on the same regimen of isotonic saline. The barbiturate was given orally in both groups. 30 hrs after the last dose of drug, all Ss from both groups were tested for susceptibility to audiogenic seizure by exposing each to the sound of an intense electric bell. While all those on phenobarbitone had florid seizures, only one of the other group did so. The induction of seizure susceptibility through pharmacological means is viewed as significant. (17 ref)—R. S. Albin.

9058. Gibermann, E.; Chari-Bitron, A.; Millo, S. & Gothliff, S. (Israel Inst for Biological Research, Ness-Ziona) Effect of  $\Delta^1$ -tetrahydrocannabinol on K<sup>+</sup> influx in rat erythrocytes. *Experientia*, 1974, Vol 30(1), 68-69. —Examined the inhibiting effect of the major psychoactive component of hashish on cation transport in the red blood cells of rats. (German summary)

9059. Graham, J. D. & Lewis, M. J. (Welsh National School of Medicine, Cardiff) The effect of  $\Delta^1$ -tetrahydrocannabinol on the uptake of [<sup>3</sup>H]-(-)-noradrenaline by the isolated perfused heart of the rat. *British Journal of Pharmacology*, 1974(Oct), Vol 52(2), 233-236. —The effects of cocaine, Tween-80, and  $\Delta^1$ -tetrahydrocannabinol ( $\Delta^1$ -THC) in Tween-80 on the uptake of [<sup>3</sup>H]-(-)-noradrenaline (<sup>3</sup>H-NA) by rat isolated perfused hearts were studied, using Iverson's methods (1963). It was found that both cocaine and  $\Delta^1$ -THC caused a concentration-related linear inhibition of the <sup>3</sup>H-NA uptake. Tween-80 alone also inhibited the uptake but to a lesser extent than that produced by the combination of  $\Delta^1$ -THC and Tween-80. It is concluded that  $\Delta^1$ -THC inhibits the accumulation of <sup>3</sup>H-NA in rat perfused hearts. —*Journal abstract*.

9060. Grahame-Smith, D. G. & Green, A. R. (Radcliffe Infirmary, Oxford, England) The role of brain 5-hydroxytryptamine in the hyperactivity produced in rats by lithium and monoamine oxidase inhibition. *British Journal of Pharmacology*, 1974(Sep), Vol 52(1), 19-26. —Subcutaneous administration to rats of lithium chloride (LiCl) (3 meq/kg) twice daily for 3 days followed by monoamine oxidase (MAO) inhibition the 4th day produced a hyperactivity syndrome. 3 or more injections of LiCl (3 meq/kg) were necessary for measurable hyperactivity, but 1 dose of 10 meq/kg 5 hrs before tranlycypromine also caused hyperactivity. The syndrome was blocked by *p*-chlorophenylalanine. 3 days of LiCl pretreatment did not alter brain tryptophan or 5-hydroxytryptamine (5-HT) concentrations, but 5-HT synthesis was increased 70%. LiCl did not potentiate the hyperactivity following 5-methoxy *N,N*-demethyltryptamine, but one dose of LiCl (3 meq/kg), while not altering 5-HT synthesis, potentiated hyperactivity following

MAO inhibition and levotryptophan (50 mg/kg). Results suggest that lithium causes an initial alteration of 5-HT available for release at the nerve ending, followed after further treatment by increased 5-HT synthesis. —*Journal abstract*.

9061. Gray, Peter. (Boston Coll) Effect of adrenocorticotrophic hormone on conditioned avoidance in rats interpreted as state-dependent learning. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 281-284. —140 male Charles River CD rats were given 1 training trial that was followed 2 days later by 1 test trial in a "step-out" passive avoidance task. Each S was injected with either ACTH or placebo before training and before testing. 4 groups of Ss were used, representing the 4 possible training-testing injection combinations: placebo-placebo, placebo-ACTH, ACTH-placebo, and ACTH-ACTH. ACTH given in testing increased avoidance for subjects that had received ACTH in training and decreased avoidance for those that had received placebo in training. —*Journal abstract*.

9062. Green, A. R. & Grahame-Smith, D. G. (Radcliffe Infirmary, MRC Unit, Oxford, England) The role of brain dopamine in the hyperactivity syndrome produced by increased 5-hydroxytryptamine synthesis in rats. *Neuropharmacology*, 1974(Nov), Vol 13(10-11), 949-959. —The syndrome of hyperactivity produced in rats by the administration of tranlycypromine followed 30 min later by tryptophan was inhibited by  $\alpha$ -methyl-*p*-tyrosine ( $\alpha$ -MPT). While brain tryptophan and 5-hydroxytryptamine (5-HT) concentrations rose to levels observed in Ss not pretreated with  $\alpha$ -MPT, noradrenaline (NA) and dopamine (DA) concentrations were depleted by 75%. The administration of levodopa 1 hr after the 2nd dose of  $\alpha$ -MPT almost restored the brain DA concentrations, did not restore brain NA concentrations but did cause return of the hyperactivity produced by tranlycypromine and tryptophan. The  $\beta$ -hydroxylase inhibitor disulfiram given 6 hrs before tranlycypromine and levotryptophan depleted brain NA by 75% but had no effect on brain DA and did not inhibit hyperactivity. The hyperactivity response seen after administration of tranlycypromine and 5-methoxy *N,N*-dimethyltryptamine, which probably acts as a 5-HT analog stimulating postsynaptic 5-HT receptor sites, was completely inhibited by  $\alpha$ -MPT pretreatment. Results are tentatively interpreted as indicating that at some point between the postsynaptic 5-HT receptor sites initiating the production of the hyperactivity syndrome and the mechanisms responsible for the expression of the syndrome, lies a system of dopaminergic neurones. Activity of these neurones depends on adequate DA concentrations, and depletion breaks the neuronal sequences necessary for the behavioral expression of 5-HT receptor site stimulation. (18 ref)—*Journal abstract*.

9063. Green, Marvin; Zelson, Carl & Behrendt, Hans. (New York Medical Coll, NY) Sweating function in the heroin withdrawal syndrome of neonates. *International Journal of the Addictions*, 1974, Vol 9(4), 495-502. —Examined the effect of 3 sudorific drugs—acetylcholine, epinephrine, and nicotine—on the sweating response of premature low-birth-weight neonates with heroin withdrawal symptoms. Results indicate signifi-

cantly greater hyperhidrotic responses in addicted neonates as compared to healthy premature controls. (17 ref)

9064. Greenblatt, David J.; Shader, Richard I. & Koch-Weser, Jan. (Massachusetts General Hosp. Boston) **Pharmacokinetic determinants of the response to single doses of chlordiazepoxide.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1395-1397.—Measured blood concentrations of chlordiazepoxide in 9 healthy male and female volunteers after administration of single 25-mg doses. Peak blood concentrations and rates of absorption and disappearance varied considerably among the Ss. Such pharmacokinetic variations have important clinical consequences and probably contribute to individual differences in the response to minor tranquilizers.—*Journal abstract.*

9065. Grelk, D. F.; Papon, B. A.; Cole, J. E. & Rowe, F. A. (Illinois Inst of Technology) **The influence of caging conditions and hormone treatments on fighting in male and female hamsters.** *Hormones & Behavior*, 1974(Dec), Vol 5(4), 355-366.—In an experiment with 45 male and 44 female golden hamsters, more individually caged, gonadectomized female Ss fought prior to the initiation of hormone treatments than did group-caged females. Daily injections of testosterone propionate (TP), estradiol benzoate (EB), or progesterone (P) had no influence on the number of individually caged females that fought. However, TP and EB were effective in increasing the number of group-caged females that fought. In contrast to females, both individually and group-caged males fought infrequently after castration. Daily injections of TP, EB, or P were effective in increasing the number of individually caged males that fought, while only TP and EB were effective in group-caged males. P failed to increase the number of group-caged Ss of either sex that fought. (21 ref)—*Journal abstract.*

9066. Hewitt, David & Milner, Jean. (U Toronto, School of Hygiene, Ontario, Canada) **Drug-related deaths in the United States: First decade of an epidemic.** *Health Services Reports*, 1974(May), Vol 89(3), 211-218.—Describes the increase in drug-related deaths in the US between the mid-1950s and the mid-1960s. (20 ref)

9067. Horn, A. S. & Trace, R. C. (MRC Neurochemical Pharmacology Unit, U Cambridge, England) **Structure-activity relations for the inhibition of 5-hydroxytryptamine uptake by tricyclic antidepressants into synaptosomes from serotonergic neurones in rat brain homogenates.** *British Journal of Pharmacology*, 1974(Jul), Vol 51(3), 399-403.—Examined the effects of imipramine analogs as inhibitors of <sup>3</sup>H-5-hydroxytryptamine uptake into homogenates of rat brain hypothalamus. For structures having a 3-carbon side chain, the tertiary amine derivative was more potent than the compound with a secondary amine function. Potency was reduced by increasing or decreasing the length of the 3-carbon side chain by 1 carbon atom. Substitution of methyl groups in the  $\alpha$  or  $\beta$  position also lead to a fall in potency. Replacement of the dimethylene bridge in imipramine by a sulphur atom or by substitution of a C=C double bond for the exocyclic N-C bond of

imipramine both produced weaker inhibitors of 5-hydroxytryptamine.—*Journal abstract.*

9068. Howes, J. & Osgood, P. (Sheehan Inst, Cambridge, MA) **The effect of  $\Delta^9$ -tetrahydrocannabinol on the uptake and release of <sup>3</sup>H-dopamine from crude striatal synaptosomal preparations.** *Neuropharmacology*, 1974(Dec), Vol 13(12), 1109-1114.— $\Delta^9$ -Tetrahydrocannabinol ( $\Delta^9$ -THC) and a water soluble ester derivative (compound I) caused a concentration-related decrease in the uptake of <sup>3</sup>H-dopamine (<sup>3</sup>H-DA) into crude synaptosomal preparations derived from male Charles River mouse striata. Both were less potent than amphetamine in this preparation. In the presence of amphetamine the  $IC_{50}$  of  $\Delta^9$ -THC was unaffected. The  $IC_{50}$  is the concentration of drug in the medium which will inhibit the uptake of <sup>3</sup>H-DA into the synaptosomes by 50%. However, in the presence of  $\Delta^9$ -THC, the dose response curve to amphetamine was shifted to the right, and the  $IC_{50}$  of amphetamine was increased.  $\Delta^9$ -THC and compound I increased the release of <sup>3</sup>H-DA from preparations pre-incubated with <sup>3</sup>H-DA. The effect was small but significant. The effects of amphetamine and  $\Delta^9$ -THC combined were additive on this system. The mode of action of  $\Delta^9$ -THC with regard to the dopaminergic system of the striatum is discussed. (25 ref)—*Journal abstract.*

9069. Huntley, M. Stephen. (U Vermont) **Effects of alcohol, uncertainty and novelty upon response reaction.** *Psychopharmacologia*, 1974, Vol 39(3), 259-266.—Conducted an experiment with 21-30 yr old male paid volunteers with normal vision. Following consumption of an alcohol or placebo beverage, 1 group of 12 Ss made familiar and a 2nd group made novel responses to tachistoscopically presented letters from stimulus groups comprised of 2, 4, or 8 letters. It was found that blood alcohol concentrations approximating 80 mg-% had little effect on letter identification times when stimulus-response associations were highly familiar. When associations were novel, identification times were increased by alcohol, and the magnitude of the increase was logarithmic with the number of equally likely stimulus-response pairs. When obtained, alcohol effects retarded selection of the identification response rather than influencing stimulus recognition per se.—*Journal abstract.*

9070. Jones, Ben M. (U Oklahoma, Health Sciences Ctr, Oklahoma City) **Circadian variation in the effects of alcohol on cognitive performance.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1212-1219.—Administered Raven's Advanced Progressive Matrices to 40 male medical students during the afternoon after Ss drank either 1.32 ml/kg of alcohol and their blood alcohol concentration (BAC) had descended to 0.09% or a placebo. Results are compared with a previous study which was identical except that the Ss were tested in the evening. The scores of the alcohol group were significantly poorer than those of the placebo group in the afternoon session, but the scores were no different between alcohol and placebo groups tested in the evening. The alcohol group in the afternoon performed significantly more poorly than the alcohol group in the evening. The alcohol metabolism rate was faster in the afternoon group than it was in the evening group. No

differences were found in amount of alcohol consumed, peak BAC, time to reach peak, or absorption rate. The correlation between test performance and elimination rate was not significant. Data suggest a circadian variation in the effects of alcohol. Possible state-dependent effects are discussed.—*Journal abstract.*

9071. Kamei, Chiaki & Ueki, Showa. (Dainippon Pharmaceutical Co, Research Lab, Osaka, Japan) **Naloxone-induced abstinence syndromes in morphine-treated mice.** *Japanese Journal of Pharmacology*, 1974(Aug), Vol 24(4), 655-657.—In male ddNS strain, morphine-dependent mice, naloxone caused increased jumping, ambulation, and rearing, loss of body weight, and fall in rectal temperature, peaking at 30 min after naloxone injection. It is suggested that changes in exploratory behavior and rectal temperature, as well as the jumping response and body-weight loss, would be more reliable in evaluating physical dependence in mice.

9072. Kamei, Chiaki; Masuda, Yoshinobu & Shimizu, Masanao. (Dainippon Pharmaceutical Co, Research Lab, Osaka, Japan) **Effects of psychotropic drugs on hypothalamic self-stimulation behavior in rats.** *Japanese Journal of Pharmacology*, 1974(Aug), Vol 24(4), 613-619.—In male Wistar rats with chronic electrodes implanted in the lateral posterior hypothalamus, intraperitoneal chlorpromazine, levomepromazine, haloperidol, clozapine, and oxypertine caused a selective depression of self-stimulation at nondebilitating doses, and a dose-response relationship was also observed. Diazepam depressed this behavior at a dose much larger than that impairing rotarod performance. Chlordiazepoxide failed to depress self-stimulation even at 50 mg/kg and rather slightly facilitated this behavior at smaller doses. The mode of action of pentobarbital was similar to that of diazepam. Antidepressants, imipramine, and amitriptyline depressed this behavior only at doses larger than those which significantly impaired coordinated motor activity. Methamphetamine facilitated self-stimulation at 5-1 mg/kg but depressed it at 5 mg/kg. It is concluded that hypothalamic self-stimulation is most selectively depressed by major tranquilizers.—*Journal abstract.*

9073. Kekki, Matti; Pentikäinen, Pertti & Mustala, Olli. (U Helsinki, Finland) **Effect of acute and prolonged ethanol administration on serotonin metabolism and excretion in urine and bile of rats.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1195-1204.—Acute administration of ethanol to male Sprague-Dawley rats increased the proportion of conjugates of 5-hydroxytryptophol in the urine and bile, whereas prolonged administration increased the formation of 5-hydroxyindoleacetic acid and its conjugates. (18 ref)

9074. Korol, S. & Owens, G. W. (U Geneva, Ophthalmological Clinic, Switzerland) **Glycine, strychnine and retinal inhibition.** *Experientia*, 1974, Vol 30(10), 1161-1162.—Studied the reversible inhibitory effect of glycine on rabbit retina in vivo. A loss of oscillatory potential and a reduction of amplitude were observed, and strychnine is indicated as a glycine antagonist. (French summary)

9075. Kulkarni, S. K. & Dandiya, P. C. (S.M.S. Medical Coll, Jaipur, India) **A preliminary report on the action of imipramine and antiparkinsonian agents on**

the open field behaviour of rats. *Japanese Journal of Pharmacology*, 1974(Oct), Vol 24(5), 809-810.

9076. Levy, Carolyn J.; Carroll, Marilyn E.; Smith, James C. & Hofer, Kurt G. (Florida State U) **Antihistamines block radiation-induced taste aversions.** *Science*, 1974(Dec), Vol 186(4168), 1044-1045.—When male albino rats were treated with an antihistamine prior to being given sublethal doses of ionizing radiation, the formation of a conditioned saccharin aversion was completely inhibited. It is suggested that an increase in histamine production after radiation exposure represents the physiological basis of radiation-induced taste aversions. (28 ref)

9077. Linnoila, M. (U Helsinki, Finland) **Effects of drugs and alcohol on psychomotor skills related to driving.** *Annals of Clinical Research*, 1974(Feb), Vol 6(1), 7-18.—Uses results of research from the literature to discuss the human information-processing system with respect to monitoring and processing data acquired and used during driving. Factors influencing this information processing and methods used to study extra-risk factors for traffic are outlined, with specific reference to the effects of alcohol, cannabis, neuroleptic and antianxiety agents, hypnotics, anesthetics, antihistamines, anticholinergics, analgesics, and stimulants, as well as the effects of drugs and alcohol in combination. Further and more sophisticated studies are urged, especially of dose-response relationships and of the correlations between psychomotor effects of drugs and their main metabolites' plasma concentrations. (126 ref)—B. McLean.

9078. Linnoila, M.; Otterström, S. & Anttila, M. (U Helsinki, Finland) **Serum chlordiazepoxide, diazepam and thioridazine concentrations after the simultaneous ingestion of alcohol or placebo drink.** *Annals of Clinical Research*, 1974(Feb), Vol 6(1), 4-6.—The effect of .8 g/kg of alcohol on serum diazepam, chlordiazepoxide, and thioridazine levels was examined in a double-blind cross-over trial with 5 healthy male student volunteers. The drugs were administered in gelatin capsules simultaneously with alcoholic or placebo bitter drinks of equal volume. Blood samples were taken 30, 60, 90, 120, 150, and 240 min later. Serum chlordiazepoxide levels only were significantly ( $p < .05$ ) increased at 120 and 150 min after alcohol as compared to those after placebo drink. The availability of any drug was not, however, significantly modified after alcohol. Taken with previous findings in behavioral studies, the results suggest that the interaction of diazepam, chlordiazepoxide, or thioridazine with alcohol takes place centrally.—*Journal abstract.*

9079. Lippmann, W. & Puzskey, T. A. **Effects of benzocetamine and chlordiazepoxide on turnover and uptake of 5-hydroxytryptamine in the brain.** *British Journal of Pharmacology*, 1974(Aug), Vol 51(4), 571-575.—Studied the effects of benzocetamine, a new antianxiety drug, and of chlordiazepoxide on the turnover of drug, and of 5-hydroxytryptamine (5-HT) and on 5-HT neuronal reuptake mechanisms in rat brain. Both drugs (20 mg/kg, administered intraperitoneally) decreased the disappearance of intraventricularly administered <sup>3</sup>H-5-HT. In addition, both drugs partially prevented the  $\alpha$ -ethyl-3-hydroxy-4-methylphenethylamine-induced depletion of rat brain 5-HT. It is concluded that benzocetamine, like chlordiazepoxide, decreased 5-HT turnover

and that this effect supports the suggestion that 5-HT neurons are involved in the antianxiety effects of these drugs in man.—*Journal abstract.*

9080. Lörcher, H. V.; Borbély, A. A.; Waser, P. G. & Huston, J. P. (U Zürich, Inst of Pharmacology, Switzerland) **Hypothalamic self-stimulation during light anesthesia in the rat.** *Experientia*, 1974, Vol 30(3), 253-254.—Investigated electrical muscle activity as an operant response in a self-stimulation experiment with adult male albino rats under light pentobarbital anesthesia (judged by loss of the righting reflex). Electrodes were implanted in the lateral hypothalamic area and Ss who exhibited self-stimulation were then tested. Reward was contingent on high activity in the left supraspinatus muscles concurrent with low activity in the right group, as measured by gold-tipped electrodes. Operant conditioning was successful despite the anesthesia. Results extend previous reports of successful operant conditioning after the ablation of forebrain structures. (German summary) —C. Wright.

9081. Marley, E. & Sellar, T. J. (Inst of Psychiatry, London, England) **Effects of nicotine given into the brain of fowls.** *British Journal of Pharmacology*, 1974(Jul), Vol 51(3), 335-346.—Nicotine was injected into the 3rd cerebral ventricle of adult nonanesthetized fowls and infused into various brain sites of nonanesthetized young chickens. Its effects given intraventricularly, applied to the brain stem, or injected intravenously to anesthetized fowls were also examined. Intraventricular nicotine in nonanesthetized Ss evoked behavioral and electrocortical sleep lasting 3-5 min; Ss then reawakened and developed postural changes and tachypnea. Intraventricular nicotine reduced or suppressed operant keypecking. Nicotine infused into the diencephalon, telencephalon, or myelencephalon of young Ss induced behavioral and electrocortical sleep; tachypnea and postural changes did not develop. Effects of nicotine, administered intraventricularly or infused into the brain, were prevented by pempidine but not hyoscine. Nicotine given intraventricularly to anesthetized Ss produced brief apnea and rise in blood pressure, the latter much prolonged by acute vagal division and abolished by spinal cord section.—*Journal abstract.*

9082. Marley, E. & Sellar, T. J. (Inst of Psychiatry, London, England) **Effects of cholinomimetic agents given into the brain of fowls.** *British Journal of Pharmacology*, 1974(Jul), Vol 51(3), 347-351.—5 cholinomimetic agents were injected into the 3rd cerebral ventricle of adult, nonanesthetized fowls and infused into the hypothalamus of nonanesthetized young chickens. Carbachol evoked behavioral and electrocortical arousal similar to that evoked by muscarine but lacked its postural and respiratory effects; pilocarpine increased respiratory rate and induced postural changes but lacked other behavioral effects and did not alter electrocortical activity. Benzoycholine induced tachypnea, postural changes, and brief electrocortical arousal; acetylcholine was effective only with physostigmine, when electrocortical arousal, postural changes, and tachypnea developed. Methacholine induced tachypnea and postural changes. Effects of carbachol and pilocarpine were prevented by hyoscine and those of benzoylcholine by pempidine; hyoscine and pempidine together prevented effects of

methacholine and attenuated those of acetylcholine with physostigmine.—*Journal abstract.*

9083. Mately, Robert E. & Krall, Roger G. (U Bridgeport) **An initial investigation of the psychedelic drug flashback phenomena.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 854-860.—Describes an initial investigation of some characteristics of those persons experiencing "flashbacks" (or recurrences of drug effects) and provides systematic descriptions of the flashback phenomena. Data from 22 undergraduates show that the drug user experiencing flashbacks, when compared with the drug user not experiencing flashbacks, exhibits neither significant differences in psychopathological characteristics as measured by the MMPI nor significant differences in attentional processes as measured by the Embedded Figures Test. There were few biographical differences between the 2 subject groups. Subjective reports by the flashback Ss offered some revealing details of the flashback experience itself.—*Journal abstract.*

9084. Minck, K.; Danneberg, P. & Knappen, F. [Effects of psychotropic drugs on exploratory behavior of mice.] (Germ) *Psychopharmacologia*, 1974, Vol 39(3), 245-257.—Studied locomotion (number of crossed squares) in an open-field situation and exploration (number of explored holes) in a hole-board situation in NMRI strain white mice. The sedative properties of chlorpromazine, haloperidol, and reserpine decreased both exploration and locomotion. Chlordiazepoxide, oxazepam, and diazepam in low doses caused an increase of locomotion and in higher doses a decrease of exploration. Phenobarbital increased both locomotion and exploration. Amphetamine caused a significant inhibition of exploration in low doses which did not increase locomotion. When locomotion was enhanced by higher doses, exploration still remained depressed. Imipramine in large doses caused a decrease of both locomotion and exploration. Mescaline caused an increase of locomotion and a decrease of exploration, but only in a dose range which has to be considered neurotoxic. (32 ref)—*English summary.*

9085. Moreau, Tina & Birch, Herbert G. (Queens Coll, City U New York) **Relationship between obstetrical general anesthesia and rate of neonatal habituation to repeated stimulation.** *Developmental Medicine & Child Neurology*, 1974(Oct), Vol 16(5), 612-619.—Compared 29 infants (GA) whose mothers had an obstetrical general anesthesia with 31 infants (NGA) whose mothers had not (though they might have had a local anesthesia or analgesic medication). Eye-movement responses to an auditory stimulus and cardiac responses to a somesthetic stimulus habituated more rapidly and remained more consistently reduced in NGA than in GA infants. (French, German, & Spanish summaries)—P. W. Pruyser.

9086. Mullins, Cecil J.; Vitola, Bart M. & Abellera, James W. **Users of cannabis only.** *US AFHRL Technical Report*, 1974(Apr), No 74-41, 12 p.—Compared 2,842 US Air Force trainees who had used only cannabis with 1,843 who had used cannabis along with other drugs and with a control sample of 9,368 on whom no drug-using information was available. All Ss were compared on 5 aptitude measures, educational level at time of enlist-

ment, and 3 measures of Air Force performance. Results indicate that cannabis-only users were more effective than users of other drugs and that even cannabis-only users compared unfavorably with controls in certain metrics which appear to require motivation as an important component. It is suggested that this may be evidence for the amotivational syndrome reported in the literature.—*Journal abstract.*

9087. Nakajima, Shinshu. (Dalhousie U, Halifax, Nova Scotia, Canada) **Amnesic effect of cycloheximide in the mouse mediated by adrenocortical hormones.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 378-385.—Conducted 6 experiments with a total of 33 groups of 10 male Swiss albino mice. Subcutaneous injection of cycloheximide shortly before a training trial of a passive avoidance task resulted in an amnesia of the avoidance response. However, amnesia was absent in adrenalectomized Ss in which cerebral protein synthesis was suppressed by cycloheximide. Injection of corticosteroids antagonized the amnesic effect, most effectively if the steroids were given immediately after training. The influence of the hormonal treatments upon the amnesic effect was not attributable to a change in general activity level. It is concluded that the amnesic effect of subcutaneously injected cycloheximide appeared to be mediated by hormonal deficiency and not related to suppression of the cerebral protein synthesis. (28 ref)—*Journal abstract.*

9088. Nasello, Antonia G.; Astrada, Carlos A. & Ramirez, Oscar. (U Nacional de Córdoba, Facultad de Ciencias, Químicas, Argentina) **Effects on the acquisition of conditioned avoidance responses and seizure threshold in the offspring of amphetamine treated gravid rats.** *Psychopharmacologia*, 1974, Vol 40(1), 25-31.—Female albino rats with 30-70% of conditioned responses in an avoidance conditioning session in a Warner cage were treated daily during pregnancy with .5 mg/kg of amphetamine administered subcutaneously. They had been mated with males selected with the same criterion who received no treatment. The control group differed from the treated one in that females received the same volume of saline solution instead of the drug. Teratogenic effects of the drug were not observed, and there were no differences in either the age of eyes or vaginal aperture or in growth rate determined by the weekly weight between offspring of treated and control mothers. The pups of amphetamine-treated mothers had better acquisition and retention of conditioned avoidance responses than those of control mothers when the pups were 90 days old, but no difference was observed at the age of 45 days. On the other hand, offspring of the treated group had a lower hippocampal seizure threshold than the control group. The relation between the mechanisms of learning and seizure is discussed in connection with potassium release by stimulation in the hippocampus. (26 ref)—*Journal abstract.*

9089. Nash, Harvey & Stone, George C. (California State Coll, School of Social & Behavioral Sciences, Dominguez Hills) **Psychological effects of drugs: A factor analytic approach.** *Journal of Nervous & Mental Disease*, 1974(Dec), Vol 159(6), 444-448.—Used factor analysis to reanalyze data of a previously reported study by H. Nash (see PA, Vol 37:656) on the human

psychological effects of amphetamines, barbiturates, and amphetamine-barbiturate combinations. In addition to having methodological implications, the reanalysis both confirms and further illuminates the previously reported findings. 240 male adult volunteers were assigned to 1 of 6 drug treatments (4 active medications and 2 placebos)—10 mg dextroamphetamine sulfate; 10 mg dextroamphetamine sulfate plus 65 mg amobarbital; 65 mg phenobarbital; and 10 mg methamphetamine hydrochloride plus 65 mg phenobarbital. Pre- and postdrug factor structures were similar which indicates that postdrug individual differences are largely predictable from predrug individual differences. Factor analysis results for the individual drugs also are reported. The importance of making optimal use of experimental and statistical controls to maximize detection and assessment of the effects of drugs administered in low to moderate doses is emphasized.—L. Gorse.

9090. National Clearinghouse for Drug Abuse Information. (Rockville, MD) **Methaqualone.** *National Clearinghouse for Drug Abuse Information, Report Series*, 1973(Oct), Ser 18(1), 14 p.—Describes the history, chemistry, pharmacology, and effects of methaqualone, a nonbarbiturate sedative. Articles on the potential benefits and dangers of methaqualone are reviewed. (55 ref)

9093. Nieschlag, E. & Kley, H. K. (U Düsseldorf Medizinische Klinik, W Germany) **Loss of sexual activity in rabbits actively immunized with testosterone.** *Experientia*, 1974, Vol 30(4), 434-435.—Investigated the effects of immunization with either testosterone or estrogen in 2 groups of 12-wk-old male white New Zealand rabbits. Ss were exposed to receptive female after 16 wks for 15 min and sexual activity was recorded (chasing, number of mountings, and ejaculations). Serum concentrations of total circulating testosterone, and percentages of binding of testosterone and estradiol the experimental Ss, were compared to a control group of 5 rabbits. No animal injected with testosterone showed sexual activity. Those injected with estrogen showed normal sexual activity, testosterone serum levels, and percentage binding. Serum testosterone levels in testosterone-immunized Ss were 30 times normal, and binding was increased.—C. Wright.

9094. Nicholson, A. N. & Wright, Catherine M. (Royal Air Force Inst of Aviation Medicine, Hampshire, England) **Inhibitory and disinhibitory effects of nitrazepam, diazepam and flurazepam hydrochloride on delayed matching behaviour in monkeys (*Macaca mulatta*).** *Neuropharmacology*, 1974(Nov), Vol 13(10-11), 919-926.—Studied the effect of 3 benzodiazepines—nitrazepam (.15, .45, and .75 mg/kg), diazepam (.6, 1.8, and 3.0 mg/kg), and flurazepam (.45, 1.35, and 2.25 mg/kg)—on total response time and on accuracy of response on a delayed matching task in 5 male rhesus monkeys. Increased total response time was observed after all 3 doses of diazepam and particularly nitrazepam, but after flurazepam increased total response time was limited to the highest dose. Accuracy of response on delayed matching was impaired by all 3 drugs. The effect of diazepam and flurazepam was limited to the highest dose in each case, but with nitrazepam performance was impaired also after .45 mg/kg. The effect of the 3 drugs on delayed matching was related in a complex way to the delay between stimuli and to the response demanded. It is suggested that the effect of the benzodiazepines depended on a complex interaction between the differential response of 2 systems leading to inhibited or disinhibited behavior.—*Journal abstract.*

9095. Papadakis, D. P.; Michael, C. M.; Kephais, T. A. & Miras, C. J. (U Athens, Medical School, Lab of Biological Chemistry, Greece) **Effects of cannabis smoking in blood lactic acid and glucose in humans.** *Experientia*, 1974, Vol 30(10), 1183-1184.—Tested blood samples of 5 chronic hashish smokers and 5 "naïves" (occasional smokers). Glucose was indicated not to change while lactic acid decreased immediately after hashish smoking. (French summary)

9096. Parker, Elizabeth S. et al. (U California, Coll of Medicine, Irvine) **Alcohol and the disruption of cognitive processes.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 824-828.—Studied memory processes of 12 alcoholic and 12 matched nonalcoholic male volunteers (mean ages = 35.6 and 36.3 yrs, respectively) under sober and 2 alcohol conditions (moderate dose—.67 ml/kg; high dose—1.33 ml/kg). Alcohol administration significantly impaired registration, recall, and organization in both groups. These processes were differentially susceptible to alcohol's acute effects. There were no significant differences between groups in the amount of information registered or recalled. However, alcoholics displayed significantly poorer organization under sober and intoxicated conditions, suggesting chronic impairment of abstracting ability due to alcohol. (29 ref)—*Journal abstract.*

9097. Pertwee, R. G. (U Oxford, England) **Tolerance to the effect of  $\Delta^1$ -tetrahydrocannabinol on corticosterone levels in mouse plasma produced by repeated administration of cannabis extract or  $\Delta^1$ -tetrahydrocannabinol.** *British Journal of Pharmacology*, 1974(Jul), Vol 51(3), 391-397.—Administration of 3 daily subcutaneous (SC) injections of 500 mg/kg cannabis in mice diminished thymus gland weight and produced tolerance both to the cataleptic effect of  $\Delta^1$ -tetrahydrocannabinol ( $\Delta^1$ -THC, 2 mg/kg intravenously) and to the effect of  $\Delta^1$ -THC (10 mg/kg intraperitoneally) on corticosterone plasma levels. The rise in corticosterone levels produced

by immobilization was not reduced by this pretreatment. Tolerance to the effect of  $\Delta^1$ -THC on corticosterone levels was also produced by 1 (10 mg/kg sc) and by 3 daily injections (10 or 30 mg/kg sc) of  $\Delta^1$ -THC. At 30-32°C, ambient temperatures at which cannabis does not produce hypothermia, the drug no longer reduced thymus gland weight. Both the rise in corticosterone levels produced by cannabis or  $\Delta^1$ -THC and tolerance to this effect were equally evident at room temperature and at 30-32°C.—*Journal abstract.*

9098. Pevet, P. & Saboureau, M. (Netherlands Central Inst for Brain Research, Amsterdam) **Effect of serotonin administration on the ultrastructure of pinealocytes during the period of maximal sexual activity of the male hedgehog (*Erinaceus europaeus* L.).** *Experientia*, 1974, Vol 30(9), 1069-1070.—Obtained electron microscopic data on the effect of serotonin on 8 adult male hedgehogs. A relationship between the decrease of sexual activity and the appearance of structural changes in male pinealocytes is confirmed. (French summary)

9099. Poschel, B. P.; Ninteman, F. W.; McLean, J. R. & Potoczak, D. (Parke, Davis, Research & Development Div, Ann Arbor, MI) **Intracranial reward after 5,6-dihydroxytryptamine: Further evidence for serotonin's inhibitory role.** *Life Sciences*, 1974(Oct), Vol 15(8), 1515-1522.—One intraventricular injection of 50  $\mu$ g of 5,6-dihydroxytryptamine produced, 24 hrs later, a marked increase in rates of medial forebrain bundle self-stimulation in 6 of 10 implanted male Holtzman albino rats. Whole brain serotonin levels were selectively depressed at this time, presumably because of the destructive effect on serotonin-containing neuron terminals. When whole brain serotonin levels had recovered fairly close to normal, the excitatory effect had disappeared. In Ss having self-stimulation electrodes positioned at slight distances from the medial forebrain bundle, the excitatory effect never appeared. Results support the theory that serotonergic neurons in the medial forebrain bundle are part of an inhibitory system subserving reward and motivational mechanisms. Results also show the great importance of electrode placement as a determinant of a drug's effect on self-stimulation.—*Journal abstract.*

9100. Quarterman, David & Botwinick, Chaim Y. (New York U, Medical School) **Role of biogenic amines in the reversal of cycloheximide-induced amnesia.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 386-401.—Conducted 6 experiments with male C57BL/6J mice in which amnesia was induced by pretraining subcutaneous injections of cycloheximide (CYC) in a food motivated discrimination reversal task. Magnitude of amnesia varied as a function of the amount of training on both the initial discrimination and the reversal and also as a function of the length of intertrial interval used on both the reversal and the test. Memory spontaneously recovered 48 hrs following reversal training. Recovery from amnesia was induced by pretesting injections of dextroamphetamine and 2 monoamine oxidase inhibitors, pargyline and catron. This enhanced performance was a true recovery of the memory and not a result of enhanced learning or increased arousal. Depletion of catecholamines by alpha-methyl-para-tyrosine, a tyrosine hydroxylase inhibitor,

and by diethylthiocarbamate, a dopamine beta hydroxylase inhibitor, resulted in an amnesia quantitatively and qualitatively similar to amnesia induced by CYC. Data support the hypothesis that CYC-induced amnesia is mediated via central catecholamines. (44 ref)—*Journal abstract*.

9101. Roberts, C. Allan; Kreisman, Norman R. & Waltman, Mary. (Tulane U, Medical School) **Uridine anticonvulsant effects: Selective control of nucleoside incorporation in experimental epilepsy.** *Epilepsia*, 1974(Dec), Vol 15(4), 479-500.—Determined whether uridine is the only nucleoside that has anticonvulsant properties, whether it enhances or inhibits epileptic activity and/or subsequent incorporation of nucleoside, and whether a change in RNA or DNA synthesis in epileptic regions is related to the etiology of seizures. Of the 5 nucleosides tested in male frogs, only uridine exerted an anticonvulsant effect related to selective increase in nuclear neuronal RNA of epileptic regions. The time between administration of uridine and anticonvulsant effect on electrocorticographic responses was consistent with the time required for maximal incorporation of uridine into nuclear RNA of brain components. Increase in RNA but not in DNA synthesis, in both primary and mirror focal regions, was related to epileptic phenomena. It is proposed that increased synthesis of nuclear neuronal RNA in primary and mirror foci of penicillin-induced epilepsy is directly related to the etiology of seizures and that selective alteration of uridine concentration may be responsible for both initiation and termination of epileptic activity. (French, Spanish, & German summaries) (39 ref)—*Journal summary*.

9102. Robinson, D. W.; Moberg, G. P. & Devers, Kathryn. (U California, Davis) **The feeding response to  $\beta$ -adrenergic active agents during induced compensatory growth in rats.** *Experientia*, 1974, Vol 30(6), 626-627.—Examined the sensitivity of the " $\beta$  satiety system" during induced compensatory growth in 40 female Sprague-Dawley rats. Ss were divided into 2 groups, with restrictions on 1 group's diet for a 4-wk period. Propanolol and isoproterenol were administered intraperitoneally at several stages of the experiment. The data indicate that at Day 11 the restricted diet group consumed twice as much food regardless of drug treatment. Data taken at 35 and 45 days indicate both groups had significantly ( $p < .001$ ) depressed food intake when injected with isoproterenol. Intake was restored to normal by combined injections of isoproterenol and propanolol. Results indicate there is a functional immaturity in young rats with respect to the  $\beta$ -adrenergic satiety system, but do not support the hypothesis that naturally hyperphagic Ss have a depressed  $\beta$  satiety activity. (French summary)—*R. Tomasko*.

9103. Rosloff, Barry N. & Davis, John M. (Vanderbilt U, Medical School) **Effect of iprindole on norepinephrine turnover and transport.** *Psychopharmacologia*, 1974, Vol 40(1), 53-64.—Iprindole, an antidepressant drug clinically similar to other tricyclic antidepressants, was administered chronically to groups of 5-10 male Sprague-Dawley rats by means of intraperitoneal injections. Such treatment did not alter the rate of decline of the log

of brain norepinephrine (NE) levels after NE synthesis inhibition with  $\alpha$ -methyltyrosine methyl ester. In addition, a single dose of iprindole did not significantly alter uptake of intracisternally administered H<sup>3</sup>-NE or the amount of H<sup>3</sup>-normetanephrine formed from such administration. Furthermore, iprindole added in vitro showed very low potency in blocking the uptake of labeled NE, metaraminol, serotonin, and dopamine into crude synaptosomal preparations. The bearing of these findings on the hypothesized mechanism of action of the tricyclic antidepressants, which affect all of the above parameters, is discussed. (47 ref)—*Journal abstract*.

9104. Šrám, R. J.; Goetz, P. & Zudová, Z. (Inst hygieny a epidemiologie, Prague, Czechoslovakia) [**Genetic effects of LSD.**] (Czech) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 80-87.—Studied mutation-producing effects of LSD on *Drosophila melanogaster*, rats, and mice. In *Drosophila* both the sex-linked recessive lethal and the mosaic mutation were found. Cytological tests of germinal cells in rats and mice did not show chromosome change after doses of 1,000  $\mu$ g LSD/kg. 1,000  $\mu$ g/dose changed the number of chromosomes only in cells of meiotic division. 5,000  $\mu$ g LSD/kg induced dominant lethal mutation in male mice and 1,000  $\mu$ g LSD/kg in females. When extrapolated to human organisms, approximately 800  $\mu$ g LSD/kg was found to be the threshold for dominant lethal mutation. An interval of 3 mo between LSD use and conception is recommended, in order to decrease the risk of damage to genetic material. (Russian & English summaries) (59 ref)—*V. Fischmann*.

9105. Sable-Amplis, R.; Agid, R. & Abadie, D. (ERA-CNRS, Inst de Psychologie, Toulouse, France) **Effects of morphine on plasma lipids in the rabbit.** *Experientia*, 1974, Vol 30(9), 1055-1056.—Studied nontolerant, chronically intoxicated, and abstinent Ss. Effects on free fatty acid concentration, on other plasma lipids, and the effects of food withdrawal are reported.

9106. Sara, V. R. & Lazarus, L. (St Vincent's Hosp, Garvan Inst of Medical Research, Sydney, NSW, Australia) **Prenatal action of growth hormone on brain and behaviour.** *Nature*, 1974(Jul), Vol 250(5463), 257-258.—Investigated the hypothesis that administration of prenatal growth factor would increase the number of cortical neurons, as well as enhance subsequent learning ability. Daily dosages of 3 mg, 1 mg, 100  $\mu$ g, or 10  $\mu$ g of purified porcine growth hormone (6 U/mg) were injected subcutaneously into pregnant Wistar rats from day 7-20 of gestation. Control Ss were injected with corresponding volumes of vehicle alone. On day 20, 500  $\mu$ Ci of tritiated thymidine (<sup>3</sup>H-TdR) were administered peritoneally to all Ss. On day 7 after birth half of each litter was killed, DNA extracted from each brain, and radioactivity measured. Autoradiograms were obtained from 1 brain in each litter. The remaining offspring were tested for performance on a series of conditioned discrimination tasks of increasing difficulty. Results show significant increase in brain weight and cellular content with specific neuronal proliferation indicated by <sup>3</sup>H-TdR uptake in treated Ss. Treated Ss demonstrated superior ability on discrimination tasks as measured by trials-to-criterion, differing significantly ( $p < .001$ ) from untreated controls.—*A. Cerf-Beare*.

9107. Schacht, Ulrich & Heptner, Wolfgang. Effect of nomifensine (Hoe 984), a new antidepressant, on uptake of noradrenaline and serotonin and on release of noradrenaline in rat brain synaptosomes. *Biochemical Pharmacology*, 1974(Dec), Vol 23(24), 3413-3422. —Nomifensine is a thymoleptic drug with a moderate centrally stimulating component. Its effects on noradrenaline (NA) and serotonin (5-HT) uptake by crude synaptosome preparations from both immature female Wistar rat whole brain and from hypothalamus were studied and compared with those of several tricyclic antidepressants and dextroamphetamine. Nomifensine inhibition of NA uptake by synaptosomal fractions from hypothalamus was similar to that of nortriptyline and protriptyline. In contrast to tricyclic antidepressants, nomifensine was a powerful inhibitor of NA uptake in synaptosomes obtained from whole brain. Nomifensine had only a moderate effect on 5-HT accumulation, comparable with that of desipramine. It is suggested that the centrally stimulating component of nomifensine, which is lacking in most thymoleptic drugs, is based upon its strong inhibition of catecholamine reuptake into noradrenergic as well as dopaminergic nerve endings. Nomifensine has no releasing effects on the efflux of NA from rat brain synaptosomes, thus differing clearly from dextroamphetamine and other indirectly acting sympathicomimetic agents. (37 ref)—*Journal abstract*.

9108. Schenkel-Hulliger, L.; Koella, W. P.; Hartmann, A. & Maitre, L. (Ciba-Geigy AG, Biological Lab, Basel, Switzerland) Tremorogenic effect of thyrotropin releasing hormone in rats. *Experientia*, 1974, Vol 30(10), 1168-1170. —Studied the mechanism of the thyrotropin releasing hormone (TRH) responsible for its beneficial effect in treating depressive patients. TRH's central nervous system effects are shown to be not mediated by stimulation of the pituitary-thyroid axis, nor through the known cholinergic or adrenergic pathways. Its antidepressant effect results from either a direct central nervous stimulation or indirect thyroid activation. (German summary)

9109. Schroeder, D. J.; Collins, W. E. & Elam, G. W. (FAA Civil Aeromedical Inst, Oklahoma City, OK) Effects of secobarbital and d-amphetamine on tracking performance during angular acceleration. *Ergonomics*, 1974(Sep), Vol 17(5), 613-621. —30 male college students were randomly assigned to one of the following groups: placebo (lactose), secobarbital (100 mg), or dextroamphetamine (10 mg). The drugs or placebo were administered in capsules in a double-blind procedure following practice at a tracking task and baseline determinations of tracking performance levels in both static (stationary) and dynamic (angular acceleration) conditions. Tests were conducted in total darkness with the exception of the illuminated tracking display. With the rotator stationary, dextroamphetamine Ss performed significantly better than controls during the 2-hr and 4-hr postdrug sessions. However, during angular acceleration, secobarbital Ss made significantly more tracking errors and had significantly more vestibular nystagmus than both the control and the dextroamphetamine groups for all postdrug sessions. Findings agree with previous studies of alcohol effects: depressant drugs may have little or no deleterious influence on tracking performance

in static environments, but may produce marked performance degradation during angular motion. The primary cause of this performance impairment appears to be a vestibulo-ocular one; the ability to inhibit vestibular nystagmus by visual fixation is impaired. (French & German summaries)—*Journal abstract*.

9110. Shimizu, M. et al. (Dainippon Pharmaceutical Co, Research Lab, Osaka, Japan) 1,2-Benzisoxazole-3-acetamidoxime hydrochloride: A new psychotropic agent. *Experientia*, 1974, Vol 30(4), 405. —Summarizes in vivo and in vitro studies in mice, rats, cats, and guinea pigs of the effects of 1,2-benzisoxazole-3-acetamidoxime hydrochloride (PF-257), a psychotropic agent that was shown to have a pharmacological profile and mode of action different from other psychotropic drugs. It is noted that PF-257 could prevent and reverse the decrease of monoamines caused by reserpine, although it is not a monoamine oxidase inhibitor. A property of retarding the catecholamine turnover is also suggested. (French summary)—*C. Wright*.

9111. Sofia, R. Duane & Barry, Herbert. (Wallace Lab, Cranbury, NJ) Acute and chronic effects of  $\Delta^9$ -tetrahydrocannabinol on food intake by rats. *Psychopharmacologia*, 1974, Vol 39(3), 213-222. —The effects of intraperitoneally injected  $\Delta^9$ -tetrahydrocannabinol (THC) were compared with dextroamphetamine sulfate (AMP) on food intake in 30 male Wistar albino rats which were given access to food for 6 hrs each day. Food intake was markedly reduced in a dose-related fashion by THC (2.5 and 5 mg/kg) in the 1st 2 hrs after drug administration. This anorexic effect persisted for the next 4 hrs and even on the next day. The anorexic potency of AMP (1.25 and 2.5 mg/kg) was approximately twice that of THC in the initial 2-hr interval after a single dose, but during the next 4 hrs and on the next day there was a compensatory increase in food consumption. Daily administration of THC (2.5 mg/kg) for 9 days greatly decreased food intake and body weight gain of Ss which were injected immediately before feeding, but had little effect on Ss injected 16 hrs before feeding. (25 ref)—*Journal abstract*.

9112. Squire, Larry R. & Davis, Hasker P. (VA Hosp, La Jolla, CA) Cerebral protein synthesis inhibition and discrimination training: Effects of extent and duration of inhibition. *Behavioral Biology*, 1975(Jan), Vol 13(1), 49-57. —Anisomycin, an inhibitor of cerebral protein synthesis, impaired memory in C3H  $\times$  Balb/c mice measured 5, 7, or 14 days after discrimination training. A large subcutaneous dose of anisomycin (210 mg/kg) impaired memory to a greater extent than a smaller dose (30 mg/kg) and inhibited cerebral protein synthesis more completely. The impairment produced by the smaller dose was not increased by maintaining protein synthesis inhibition for at least 13½ hrs beyond training with repeated injections (30 mg/kg). Moreover, memory was not measurably impaired by a prolonged period of inhibition, beginning 1½ hrs after training. The amnesic effects of the large dose could not easily be explained by illness or by state-dependent effects. Results suggest that, in the case of discrimination training, the amnesic effects of cerebral protein synthesis inhibition were determined largely by the extent of inhibition at the time of training, rather than by the duration of inhibition. For discrimina-

tion habits, sufficient protein synthesis for the establishment of long-term memory appeared to occur close to the time of training. (15 ref)—*Journal abstract*.

9113. Strykowska, Maria. (Adam Mickiewicz U Poznan, Psychological Inst, Poland) [The influence of Dantromin on human behaviour.] (Polh) *Przegląd Psychologiczny*, 1973, Vol 16(1), 49-59.—Conducted experiments with 4 groups of Ss ( $N = 186$ ) to study the effects of the stimulant pemoline (Dantromin) on attention, reaction time, efficiency, and accuracy. The drug had a positive influence on these functions, but no significant changes in blood pressure were noted and only 1/3 of the Ss reported improvement in general feeling due to the drug. (Russian & English summaries)

9114. Sugrue, M. F. (Organon Scientific Development Group, Newhouse, Scotland) The effects of acutely administered analgesics on the turnovers of noradrenaline and dopamine in various regions of the rat brain. *British Journal of Pharmacology*, 1974(Oct), Vol 52(2), 159-165.—Noradrenaline (NA) and dopamine (DA) turnover rates were determined following synthesis blockade by  $\alpha$ -methyl- $p$ -tyrosine. Morphine, pentazocine, and methadone had no effect either on steady-state levels or on NA turnover in whole brain and hypothalamus of the rat. Although morphine had no effect on medulla-pons NA steady-state levels, a drug-induced increase in turnover rate was observed, and this action was antagonized by pretreatment with naloxone. Neither pentazocine nor methadone altered steady-state levels of NA in the medulla-pons or NA turnover rate. All 3 drugs increased DA turnover in whole brain and in corpus striatum. Naloxone pretreatment prevented increases in striatal DA turnover.—*Journal abstract*.

9115. Syme, Lesley A. & Syme, G. J. (U Western Australia, Nedlands) The role of sex and novelty in determining the social response to lithium chloride. *Psychopharmacologia*, 1974, Vol 40(1), 91-99.—In Exp I the effects of intraperitoneal lithium chloride on the social behavior of 28 male and 28 female New Zealand hooded rats were measured in unfamiliar and familiar test situations using a photographic technique. Lithium-treated females showed an increase in body contact and a decrease in social distances in comparison with saline-treated controls in both test conditions. Males administered lithium showed increased corner occupancies in the novel test setting, while in the familiar test they showed decreased body contact and increased average group social distance in comparison with the saline condition. Further tests in an exploration box confirmed that lithium decreased the general environmental responsiveness of 14 male Wistar rats. Results are discussed with reference to the antiaggressive effect of lithium. (27 ref)—*Journal abstract*.

9116. Tagliamonte, A.; Fratta, W. & Gessa, G. L. (U Cagliari, Inst of Pharmacology, Italy) Aphrodisiac effect of L-DOPA and apomorphine in male sexually sluggish rats. *Experientia*, 1974, Vol 30(4), 381-382.—Administered apomorphine or a combination of levodopa and Ro 4-4602 to 50 male Wistar rats who had been identified as sexually sluggish. Copulatory behavior was measured by introducing female rats in heat into the male's home cage during the dark phase of the cycle. Both pharmacological treatments resulted in significant

increases in mounts, intromissions, and ejaculations. Haloperidol prevented the effects of the drugs and totally suppressed sexual behavior. The effect of apomorphine is cited in support of the hypothesized stimulating effect of dopamine. (Italian summary)—C. Wright.

9117. Tarsy, D. & Baldessarini, R. J. (Boston U, Medical School) Behavioural supersensitivity to apomorphine following chronic treatment with drugs which interfere with the synaptic function of catecholamines. *Neuropharmacology*, 1974(Nov), Vol 13(10-11), 927-940.—Studied stereotyped gnawing behavior in male Sprague-Dawley rats induced by apomorphine from 1 to 4 wks after withdrawal of drugs given daily for 3 wks. Significant shifts in the dose-response relationship toward increased sensitivity to the agonist were observed following subcutaneous  $\alpha$ -methyl- $p$ -tyrosine ( $\alpha$ -MPT), reserpine, chlorpromazine, or haloperidol, while promethazine, phenobarbital, and diazepam were ineffective. The addition of atropine did not alter the enhanced sensitivity following chlorpromazine. The enhanced response following chlorpromazine and haloperidol persisted for at least 4 wks. It was not significant after only 11 days of chronic pretreatment with chlorpromazine, reserpine, or  $\alpha$ -MPT. The effective drug treatments did not lead to changes in spontaneous locomotor activity at the time of testing stereotyped responses. The appearance of increased behavioral sensitivity to apomorphine, a putative direct agonist of dopamine receptors in the corpus striatum and limbic system, when nonspecific withdrawal effects and changes in the metabolism of catecholamines or of the agonist were unlikely, suggest that the phenomenon of receptor supersensitivity following pharmacologically induced "denervation" may be involved. (54 ref)—*Journal abstract*.

9118. Tharp, Van K.; Rundell, O. H.; Lester, Boyd K. & Williams, Harold L. (U Oklahoma, Health Sciences Ctr, Oklahoma City) Alcohol and information processing. *Psychopharmacologia*, 1974, Vol 40(1), 33-52.—Conducted 3 experiments with a total of 60 21-38 yr old male volunteers to investigate the effects of acute alcohol intoxication (average blood alcohol concentration 100 mg-%) on aspects—letter-recognition accuracy, memory search reaction time, and verbal reaction time—of human information processing. Results are interpreted within the framework of E. E. Smith's (see PA, Vol 42:4966) general information processing model, using S. Sterberg's (see PA, Vol 44:11748) additive-factor method of analysis. Alcohol consistently impaired information outputting operations (i.e., response selection-organization), rather than information inputting operations (i.e., stimulus preprocessing and encoding).—*Journal abstract*.

9119. Thor, Donald H. & Ghiselli, William B. (Edward R. Johnstone Training & Research Ctr, Bordentown, NJ) Suppression of mouse killing and apomorphine-induced social aggression in rats by local anesthesia of the mystacial vibrissae. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 40-46.—Local anesthesia of the facial epidermis can effect a substantial decrease in shock-elicited fighting of paired rats. The present experiments constitute methodological extensions to mouse killing and spontaneous drug-induced social aggression. In Exp I 28 known mouse-killing male

Long-Evans hooded rats were given bilateral lidocaine or placebo injections administered under ether anesthesia. Attack and kill latencies were significantly longer under lidocaine than under placebo; all Ss killed under placebo, whereas a third of all Ss failed to kill on the initial lidocaine test. On subsequent lidocaine testing, latencies decreased and nonkilling Ss killed. In Exp II intense apomorphine-induced conspecific fighting of 48 Ss preselected for aggressiveness was markedly reduced following lidocaine anesthesia. Comparative results of both experiments are interpreted in reference to theoretical assertions regarding the import of sensory information in stimulus-bound attack and the typology of central aggression systems. (24 ref)—*Journal abstract*.

9120. Tiefer, Leonore & Johnson, Wayne. (Colorado State U) Neonatal androstenedione and adult sexual behavior in golden hamsters. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 239-247. —Notes that male rats castrated and given androstenedione neonatally can show high levels of both masculine and feminine copulatory behavior in adulthood. In the present study, 24 intact female and 30 intact male hamsters castrated at birth were treated for their 1st 20 days with oil, free testosterone, or androstenedione. All neonatal androgen treatments mimicked the naturally occurring developmental process of the male in that all androgenized groups were capable of high levels of male behavior (males but not females showing ejaculation patterns) as well as moderate levels of lordotic receptivity. There were no significant differences in effect among neonatal androgen treatments. Results are discussed as they relate to species differences, sex differences, hamster "bisexuality," and posthormone copulatory performance. (30 ref)—*Journal abstract*.

9121. Van Buskirk, Roderick & McGaugh, James L. (U California, School of Biological Sciences, Irvine) Pentylentetrazol-induced retrograde amnesia and brain seizures in mice. *Psychopharmacologia*, 1974, Vol 40(1), 77-90. —Conducted 4 experiments with a total of 1,662 mice of 3 strains (Ha/ICR, Swiss Webster, and C57BL/6J) to examine the influence of pentylentetrazol injections on brain seizure activity recorded from cortical electrodes and on retrograde amnesia in an inhibitory avoidance task. In Ha/ICR Ss, pentylentetrazol administered after training impaired retention in doses that elicited brain seizures as well as in doses just below those which elicited brain seizures. The degree of retention impairment decreased with increasing training-treatment intervals. In Swiss Webster and C57BL/6J Ss, doses of pentylentetrazol which produced brain seizures did not affect retention. Results indicate that elicitation of brain seizures is not a sufficient condition for producing retrograde amnesia with pentylentetrazol. (20 ref)—*Journal abstract*.

9122. Vanderwolf, C. H. (U Western Ontario, London, Canada) Neocortical and hippocampal activation in relation to behavior: Effects of atropine, eserine, phenothiazines, and amphetamine. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 300-323. —Conducted a series of experiments with 126 male hooded rats implanted in neocortex, dorsal hippocampal formation, septal nuclei, thalamus, hypothalamus, or midbrain reticular formation. 12 nonimplanted

Ss were also tested. Evidence suggests that the hippocampus received 2 nonspecific inputs from the brainstem, each capable of producing rhythmical slow activity. The neocortex appeared to receive 2 similar inputs, each capable of producing low voltage fast activity. One input to both hippocampus and neocortex was blocked by atropine and stimulated by eserine, and was essentially unrelated to concurrent motor activity. A 2nd input to both hippocampus and neocortex was resistant to atropine, was depressed by phenothiazines, and was activated by dextroamphetamine. Activity in this system was closely related to concurrent voluntary movement. (49 ref)—*Journal abstract*.

9123. Wendel, O. T.; Waterbury, L. D. & Pearce, L. A. (Wake Forest U, Bowman Gray School of Medicine) Increase in monoamine concentration in rat brain following melatonin administration. *Experientia*, 1974, Vol 30(10), 1167-1168. —Tested male Sprague-Dawley rats with melatonin injected into the common carotid artery or the cisterna magna. Results show significant increases ( $p < .05$ ) in both brain dopamine and norepinephrine concentration. Administration of comparable amounts of 6-hydroxymelatonin did not significantly alter brain catecholamine content. (German summary)

9124. Whitsett, J. Mal & Vandenberg, John G. (North Carolina State U, Raleigh) Influence of testosterone propionate administered neonatally on puberty and bisexual behavior in female hamsters. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 248-255. —Treated female golden hamsters with oil, 3- $\mu$ g, 30- $\mu$ g, or 300- $\mu$ g testosterone propionate (TP) as neonates in Exp I. Neonatal TP treatment delayed the onset of puberty by 4.5 days to an age near that previously reported for the male hamster. In addition, neonatal TP altered genital morphology, induced the capacity for mounting behavior, and at the highest dosage, disrupted the ability to bear and rear young. Vaginal and behavioral estrous cycles, however, were not influenced by neonatal TP. In Exp II 600- $\mu$ g TP administered neonatally blocked estrous cyclicity but did not eliminate the capacity to display feminine sexual behavior. Results imply that masculinization and defeminization are separate aspects of neurobehavioral sexual differentiation, and that defeminization includes several independent physiological processes. (29 ref)—*Journal abstract*.

9125. Yarbrough, G. G. (U Saskatchewan, Saskatoon, Canada) Actions of acetylcholine and atropine on cerebral cortical neurons in chronically morphine-treated rats. *Life Sciences*, 1974(Oct), Vol 15(8), 1523-1529. —In 4 male Sprague-Dawley rats receiving a daily intraperitoneal injection of increasing doses of morphine for 25-29 days, the sensitivity of cerebral cortical neurons to acetylcholine (ACh) and the ability of atropine to antagonize ACh effects were examined. While the responses of neurons to ACh were qualitatively and quantitatively similar between the morphinized Ss and 4 saline-injected controls, there was a marked reduction in the efficacy of atropine in blocking ACh effects in the morphine-treated Ss.—*Journal abstract*.

9126. Yeh, S. Y. (NIDA Addiction Research Ctr, Lexington, KY) Absence of evidence of biotransforma-

tion of morphine to codeine in man. *Experientia*, 1974, Vol 30(3), 264-266.—Analyzed the urine of postaddict volunteer prisoners receiving morphine sulfate 4 times/day for the presence of codeine. The small amounts of codeine that were detected were interpreted as a codeine impurity in the injected morphine rather than a biotransformation product of morphine, as has been previously reported in animal studies.

## ANIMAL PSYCHOLOGY

9127. Blanchard, Robert J.; Mast, Marian & Blanchard, D. Caroline. (U Hawaii) **Stimulus control of defensive reactions in the albino rat.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 81-88.—Conducted 4 experiments with a total of 132 male Wistar rats to examine the characteristics of stimuli that produce unconditioned defensive reactions. Results show that neither the sound nor the smell of a cat, or the sight of a dead cat, produced freezing, but that either a moving cat or dog, or the abrupt and rapid movement of an inanimate card, resulted in freezing and failure to approach the stimulus object. It is suggested that movement is a major factor in the initiation of defensive responses and that movement of a neutral stimulus may enhance the acquisition of defensive responses to that stimulus.—*Journal abstract*.

9128. Bruch, Hilde & Voss, William R. (Baylor Coll of Medicine, Texas Medical Ctr, Houston) **Infantile obesity and later weight control in the baboon.** *Nature*, 1974(Jul), Vol 250(5463), 268-269.—6 infant baboons, 3 of whom were allowed ad lib feeding during infancy with consequent rapid weight gain, and 3 whose weight gain was controlled by regulated feeding, were later tested for predisposition to obesity by allowing unlimited feeding in both groups for 4 mo. Both groups showed rapid weight gain, yet stabilized at undifferentiated weight once controlled feeding was reintroduced.—*A. Cerf-Bearé*.

9129. Fabri, K. E. (Moscow State U, USSR) **[Imitation in animals.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 104-115.—Reviews research on imitation in animals. Contemporary research is compared with the work of a pioneer Soviet animal psychologist, B. I. Khotin (1895-1950), whose published and unpublished researches are discussed. A classificatory system of imitative behaviors in animals is presented. The relationship between group behavior and imitative behavior is considered, as well as the role of imitation in the development of individual behavior patterns, especially in play activity. It is shown that the behavior of higher animals is the result of the combining and interaction of all of these behavioral components. (English summary) (31 ref)—*L. Zusne*.

9130. Frame, George W. (Utah State U, Cooperative Wildlife Research Unit) **Black bear predation on salmon at Olsen Creek, Alaska.** *Zeitschrift für Tierpsychologie*, 1974(Aug), Vol 35(1), 23-38.—Found that black bears prefer eggs over the rest of the salmon carcass and they are able to recognize live unspawned female salmon. There was no evidence of fishing territories. (German summary)

9131. Gantt, W. Horsley. (VA Hosp, Pavlovian Lab, Perry Point, MD) **Autokinesis, schizokinesis, centrokinesis and organ-system responsibility: Concepts and definition.** *Pavlovian Journal of Biological Science*, 1974(Oct-Dec), Vol 9(4), 187-191.—Presents a brief account of the origins and meanings of words derived from research in Gantt's laboratory.

9132. Hughes, Carroll W. (U Maryland, Medical School, Baltimore) **Early experience in domestication.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 407-417.—Conducted 2 experiments to assess the ontogenetic as well as phylogenetic influences of early experience on domestication. A total of 40 Long-Evans hooded and 32 Sprague-Dawley albino domestic rats and 72 1st generation, laboratory-reared wild rats were the Ss. Exp I was a factorial, reciprocal cross-foster study. Exp II was a factorial assessment of the combined effects of preweaning handling and postweaning enriched environments. These experiments on rat domestication show that preweaning handling had a strong influence on the ontogenetic development of the S in terms of reduced emotionality. Handled wild Ss became much more like domestic Ss in their behavior. This finding for handling contrasted with minimal effects for cross-fostering and enriched environments. (27 ref)—*Journal abstract*.

9133. Makarenko, N. V. (Ukrainian SSR Academy of Sciences, Bogomolets Inst of Physiology, Kiev) **[Higher nervous activity in dogs reanimated after long periods of clinical death from drowning and loss of blood.]** (Russ) *Zhurnal Vyshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 82-88.—Studied, by the secretory-alimentary technique, the state of higher nervous activity in 3 dogs reanimated after long periods of clinical death from drowning in fresh and salt water and from loss of blood. The reanimation was carried out by the donor technique with the use of 1 Bruchanenko pump and a parabiont donor. In 2 Ss the clinical death, lasting 18 min 3 sec and 20 min 39 sec from the last inspiration (21 min 51 sec and 28 min 30 sec from the moment the heart stopped) to the beginning of reanimation, was provoked by submerging the head under water. Lethal bleeding was effected from the right carotid. Death lasted 17 min 15 sec (29 min 4 sec from the beginning of blood loss). The Ss thus reanimated retained their capacity to form temporary connections to acoustic stimuli. Their higher nervous activity in these experiments corresponded to that of normal Ss. (20 ref)—*English abstract*.

9134. Pinto, D.; Doyle, G. A. & Bearder, S. K. (U Witwatersrand, Johannesburg, S Africa) **Patterns of activity in three nocturnal prosimian species, *Galago senegalensis moholi*, *G. crassicaudatus umbrosus*, and *Microcebus murinus murinus*, under semi-natural conditions.** *Folia Primatologica*, 1974, Vol 21(2), 135-147.—Studied activity patterns of 8 bushbabies (*G. senegalensis*), 3 thick-tailed galagos (*G. crassicaudatus*), and 4 lesser mouse lemurs (*M. murinus*) in laboratory cages. Total daily activity, patterns of sleep and rest, awakening behaviors, drinking, feeding, auto- and allogrooming, locomotion, and urine washing are compared in terms of species and sex differences. (38 ref)—*W. K. Redican*.

9135. Richards, David B. & Stevens, David A. (Clarion U) **Evidence for marking with urine by rats.** *Behaviora*

*Biology*, 1974(Dec), Vol 12(4), 517-523.—In an experiment with 59 Charles River CD strain albino rats, urine was collected on paper under cages housing single Ss in isolation, or adjacent to another male. Nonisolated Ss urinated only along the periphery of their cages while isolated Ss showed no such pattern of urination. When samples from the collection papers were presented to other males in preference tests, papers having high urine density were preferred over those of low urine density, papers with urine from isolated Ss were preferred over those with urine from nonisolated Ss, and papers with urine from either housing condition were preferred over clean papers.—*Journal abstract*.

### Learning & Motivation

9136. Ayres, John J.; Benedict, James O. & Witcher, Elizabeth S. (U Massachusetts, Amherst) **Systematic manipulation of individual events in a truly random control in rats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 97-103.—Truly random sequences of tone (conditioned stimuli, CSs) and shock (unconditioned stimuli, UCSs) were given to a total of 78 male Holtzman albino rats. Conditioning to the CS was measured using a conditioned suppression procedure. In Exp I eliminating chance CS-UCS pairings by systematically removing CSs that overlapped UCSs weakened conditioning monotonically as a function of the number of paired CSs removed. In Exp II systematically delaying early chance pairings, while holding constant the number of CSs, UCSs, and pairings, produced a nonsignificant weakening of conditioning. In Exp III delaying pairings again produced a nonsignificant weakening of conditioning when the early nonpaired events were CSs but significantly weakened conditioning when the early nonpairings were UCSs. Data suggest that each chance pairing in the truly random control produces an increment in conditioning unless blocked by prior UCSs alone.—*Journal abstract*.

9137. Bateson, P. P. (U Cambridge, England) **Atmospheric pressure during incubation and post-hatch behaviour in chicks.** *Nature*, 1974(May), Vol 248(5451), 805-807.—Investigated the influence of atmospheric pressure during incubation on posthatch behavioral variabilities in 10 batches (90 eggs each) of chicks. Eggs were incubated in dark, temperature-controlled incubators. Running wheels facing flashing rotating lights were used to investigate posthatch latency and frequency of approach to the lights, and preference for familiar vs novel lights. Barometric pressure during incubation was most highly associated with approach frequency. No association existed between pressure and "hatchability." Controlled pressure is suggested as a means of eliminating behavioral variability in experimental chicks.—C. Wright.

9138. Blass, Elliott M. & Hall, Warren G. (Johns Hopkins U) **Behavioural and physiological bases of drinking inhibition in water deprived rats.** *Nature*, 1974(May), Vol 249(5456), 485-486.—Studied voluntary dehydration which occurs after water deprivation when neither rat nor man drink enough water to correct the incurred fluid deficit until food also is made available. 10 adult female rats were each studied on 9 occasions on a deprivation, preloading, and drinking schedule. Results

suggest that as drinking ensues, water is quickly cleared from the stomach and absorbed, the cellular phase becomes rapidly overhydrated, and this occurs while the rats are actively engaged in drinking. The water remaining in the stomach and intestine is cleared, absorbed, and excreted in dilute urine. The exaggeration of voluntary dehydration is likely a result of allowing ample time for complete absorption following the preloads and thereby avoiding any lag in the system. Additional implications concerning other ingestive phenomena are discussed.—R. S. Albin.

9139. Blough, Donald S. (Brown U) **Steady state data and a quantitative model of operant generalization and discrimination.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Jan), Vol 104(1), 3-21.—Derives a model which predicts data related to generalization and discrimination among stimuli, using data resulting from a reference experiment with 6 naive male White Carneaux pigeons. A 2nd experiment with 3 experienced Ss provided data corresponding to the prediction of step-function results from the model. This steady-state procedure yielded positive, negative, and combination gradients of stimulus control on a wavelength continuum. Results are predicted by computer simulations based on a linear difference equation. The model applies to a set of stimuli that activate common elements; a gaussian weighting function controls the degree of activation of an element by any given stimulus. The model is conceptually similar to, and compatible with, a model of conditioning previously stated by R. A. Rescorla and A. R. Wagner (1972). (24 ref)—*Journal abstract*.

9140. Boakes, R. A. & Halliday, M. S. (U Sussex, Lab of Experimental Psychology, Brighton, England) **Disinhibition and spontaneous recovery of response decrements produced by free reinforcement in rats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 436-446.—Conducted 3 experiments with a total of 16 Holtzman albino and 48 hooded male rats. After the Ss had been trained to barpress on a variable interval schedule of reinforcement, response rates were reduced by the introduction either of extinction or of a response-independent (free) reinforcement schedule. Spontaneous recovery was consistently obtained in extinction, especially when session durations were long. Under free reinforcement conditions there was little sign of spontaneous recovery, even when with high reinforcement rates response reduction was almost as rapid as in extinction. In disinhibition tests the introduction of noise produced increased responding under free reinforcement conditions but not in extinction. Results are interpreted as demonstrating a dissociation between spontaneous recovery and disinhibition. (23 ref)—*Journal abstract*.

9141. Bronstein, Paul M.; Wolkoff, F. Dmitri & Levine, M. Jov. (Brooklyn Coll, City U New York) **Sex-related differences in rats' open-field activity.** *Behavioral Biology*, 1975(Jan), Vol 13(1), 133-138.—Conducted 2 experiments with 8 male and 8 female juvenile Sprague-Dawley albino rats in each. Results show that females were more active than males in the open field. This relationship was not apparent during initial trials but emerged as Ss were tested repeatedly. Sex-related

differences were greatly reduced, however, if postweaning handling was restricted.—*Journal abstract.*

9142. Buerkle, Udo. (Fisheries & Marine Service Biological Station, St Andrews, New Brunswick, Canada) **Gill-net catches of cod (*Gadus morhua* L.) in relation to trawling noise.** *Marine Behaviour & Physiology*, 1974(Aug), Vol 2(4), 277-281.—More cod were caught in a gill net during periods with trawling noise than during periods without trawling noise, indicating that trawling noise stimulated increased locomotor activity among cod. (18 ref)

9143. Clarke, Margaret E. & Hupka, Ralph B. (California State U, Long Beach) **The effects of stimulus duration and frequency of daily preconditioning stimulus exposures on latent inhibition in Pavlovian conditioning of the rabbit nictitating membrane response.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-A), 225-228.—Results of manipulating the daily frequency and duration of the preconditioning stimulus exposure in Pavlovian conditioning of the nictitating membrane response of 32 New Zealand white rabbits suggest that the intensity of latent inhibition was related to the absolute frequency of preconditioning stimulus exposure trials, and was a stepwise function of the frequency of daily preconditioning trials. Similarly, the intensity of latent inhibition was related to the absolute duration of the preconditioning stimulus exposure. However, latent inhibition accrued to the cumulative effect of all stimulus durations across days rather than only to the repetitive presentation of 1 stimulus.—*Journal abstract.*

9144. Cohen, Jerome S. & Tubaro, Giselle. (U Windsor, Ontario, Canada) **Effects of thirst drive on cue utilization and cue dominance of spatially separate cues in albino rats.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 451-453.—36 male Wistar albino rats under moderate (18 hrs/day) or high (23.5 hrs/day) water deprivation were required to learn either a central door cue or peripheral wall cue simultaneous discrimination in a 2-choice discrimination apparatus. Following this acquisition phase, a series of redundant-relevant cue trials with both door and wall cues were introduced. Ss were tested on the utilization of wall and door cues separately and on the dominance for each cue. It was found that drive level only affected original discrimination acquisition of the peripheral wall-cue task. Moderate-drive Ss were better able to learn the wall-cue discrimination than high-drive Ss. In general, door-cue learners were able to utilize both cues but showed dominance for door over wall cues. Wall-cue learners, however, were only able to utilize wall cues and showed dominance for wall over door cues.—*Journal abstract.*

9145. Collier, George; Hirsch, Edward; Levitsky, David & Leshner, A. I. (Rutgers State U, New Brunswick) **Effort as a dimension of spontaneous activity in rats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 89-96.—Studied the relationship between effort and voluntary activity in a braked running wheel and a voluntary treadmill. 3 experiments were conducted with a total of 60 male Sprague-Dawley rats. Effort was manipulated by varying the torque required to turn the wheel and by changing the angle of inclination of the treadmill. In both situations distance run was a linear decreasing function of effort, and work

accomplished was a nonmonotonic increasing function of effort. Findings are discussed in relation to responsivity and regulatory views of the genesis of spontaneous activity. (20 ref)—*Journal abstract.*

9146. Cone, Al L. & Teel, Parker R. (Lynchburg Training School & Hosp, VA) **Interaction of illumination with previous reinforcement history during stable FI performance.** *Psychological Record*, 1974(Fal), Vol 24(4), 511-514.—Trained 8 male Holtzman albino rats either to a high response-rate typography by an adjusting ratio technique or to a low rate typography by an adjusting interval technique before establishing stable fixed interval (FI) 60-sec performance under dim illumination. The effects of subsequent dark and bright light on FI performance were dependent on the early training procedure. It is concluded that some independent variable effects upon baseline schedules of reinforcement may actually result from interactions with previous schedules in Ss' behavioral history.—*Journal abstract.*

9147. Couch, J. V. (Madison Coll) **Reinforcement magnitude and schedule-induced polydipsia: A reexamination.** *Psychological Record*, 1974(Fal), Vol 24(4), 559-562.—Used 5 male albino Holtzman rats in a 4-phase experiment to determine the effect of reinforcement magnitude on schedule-induced polydipsia. Since previous investigations were seen as confounding reinforcement magnitude and the number of reinforcement periods, the present experiment sought to vary individually these 2 determinants of polydipsia. Unlike previous investigations, results indicate that with the number of reinforcement periods held constant, an increase in the degree of polydipsia was concomitant with an increase in the reinforcement magnitude.—*Journal abstract.*

9148. Cunningham, Christopher L. (U Oregon, Medical School, Portland) **The ultrasonic motion detector: A conditioned stimulus for rats in the CER paradigm.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 441-444.—Conducted a conditioned emotional response (CER) study with 16 female albino rats to investigate conflicting data concerning the conditioned-stimulus (CS) properties of the 40-kHz signal generated by the ultrasonic motion detector; the high-frequency signal (96-112 db) was used as the CS. Rats receiving forward pairings of the tone with shock showed progressive decreases in activity in the presence of the tone as compared to controls during off-the-baseline conditioning sessions. During the CER test session, the forward-pairings group showed reliably more suppression to the high-frequency CS. It is concluded that the ultrasonic motion detector can mediate associative response tendencies.—*Journal abstract.*

9149. Delfini, Leo F. & Fouts, Gregory T. (U Denver) **Acquisition of social facilitation in rats: A methodological study.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 807-814.—Describes a methodology to assess the effects of discrimination training on social facilitation of barpressing in rats. 12 male Sprague-Dawley albino rats were initially trained to barpress for food and then given 1 of 3 kinds of discrimination training—stimulus present (S<sup>+</sup>), stimulus absent (S<sup>-</sup>), and stimulus presented on half the trials (S<sup>0</sup>)—in a runway task. After discrimination training, Ss were again given an opportunity to barpress in the original apparatus under an extinction procedure

and were tested in the presence and absence of a stimulus rat. Ss in the S<sup>o</sup> group responded 50% less in the presence of a stimulus rat, suggesting an initial tendency for social impairment rather than facilitation in the presence of another rat. Ss in the S<sup>+</sup> group showed less social impairment than those in the S<sup>o</sup> group, with the S<sup>+</sup> group tending to respond more in the presence than absence of a stimulus rat (i.e., social facilitation). (18 ref)—*Journal abstract*.

9150. Dickinson, Anthony & Scull, John. (U Sussex, Lab of Experimental Psychology, Brighton, England) **Transient effects of reward presentation and omission on subsequent operant responding.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 447-458.—In 3 experiments a total of 12 male Lister hooded rats were run in a 2-component operant analog of the double runway in which the frequency of reward in the 1st component was varied over 0, 50, and 100%. Responding in the 2nd component was measured after either a long (60-sec) or short (3-sec) intercomponent interval (ICI). After the short ICI, 2nd-component responding was faster following nonreward than reward, while the preceding goal event had no effect after the long ICI. A comparison of performance after long and short ICIs showed that the difference at short ICIs was due solely to the depressive effects of reward which persisted well into the instrumental response sequence. (36 ref)—*Journal abstract*.

9151. Dobrovolskaya, V. N. (USSR Academy of Sciences, Pavlov Inst of Physiology, Leningrad) [Characteristics of the formation and preservation of conditioned defensive motor reflexes in the ontogeny of rats.] (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 60-67.—Performed experiments with 133 Wistar rats of both sexes in 6 age groups in an apparatus with a programed control. An avoidance reaction to a photic signal was evoked in 2 stages with a 2-mo interval between them. The rate of evocation diminished with age. There was a significant group linear connection between evocation rate and degree of preservation of traces in the nervous system during the daily learning period (30 sec or 24 hrs). Preservation of the evoked habit after a 2-mo interval increased with age up to 12 mo. In older Ss (21-24 mo) the evoked habit persisted to a lesser degree than in 12-mo-old Ss. There was a significant group reverse correlation between rate of learning and preservation of the evoked habit after the 2 mo. (24 ref)—*English abstract*.

9152. Engel, Bernard T. (Baltimore City Hosp, MD) **Electroencephalographic and blood pressure correlates of operantly conditioned heart rate in the restrained monkey.** *Pavlovian Journal of Biological Science*, 1974(Oct-Dec), Vol 9(4), 222-232.—Trained 4 monkeys to decrease and increase heart rate (HR). Mean blood pressure was positively correlated with HR during speeding and slowing. These correlations increased from early training to late training for all Ss during slowing, but not during speeding. Correlations between EEG changes and HR changes became more negative during the late phase of slow training but did not change reliably during speeding training. Baseline levels in all physiological functions changed as a function of stage of training. Response patterns during escape behavior

indicate dissociation of HR and blood pressure, whereas response patterns during avoidance behavior show correlation of HR and blood pressure.—*Journal abstract*.

9153. Figler, Michael H.; Mills, Carol J. & Petri, Herbert L. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Effects of imprinting strength on stimulus generalization in chicks (*Gallus gallus*).** *Behavioral Biology*, 1974(Dec), Vol 12(4), 541-545.—Effects of original imprinting strength on color and shape generalization involving other test objects were investigated in 19 male and female Warren Sex-Sal-Link chicks. Strength of imprinting was manipulated by varying the age at which Ss were initially exposed to the original imprinting stimulus. Results indicated that original imprinting strength affected generalization to color but not to shape cues. Data suggest that original imprinting strength affects the generalization process for those dimensions of the imprinting stimulus exerting strongest stimulus control over following behavior.—*Journal abstract*.

9154. Flaherty, Charles F. & Avdzej, Alexandra. (Rutgers State U, New Brunswick) **Bidirectional contrast as a function of rate of alternation of two sucrose solutions.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 505-507.—Reliable positive and negative contrast effects in lick-rate were obtained when the same 12 male Sprague-Dawley rats were exposed on some days to both a 32% and a 4% sucrose solution and on control days to only the 32% or only the 4% solution. Daily test sessions were 270-sec long, and the tubes containing the sucrose solutions alternated every 15 sec in one group and every 45 sec in another group. The Ss in the 15-sec alternation condition licked more in a daily session, but the degree of contrast, both positive and negative, was uninfluenced by rate of sucrose alternation.—*Journal abstract*.

9155. Foree, Donald D. & LoLordo, Vincent M. (Dalhousie U, Halifax, Nova Scotia, Canada) **Stimulus-reinforcer interactions in the pigeon: The role of electric shock and the avoidance contingency.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Jan), Vol 104(1), 39-46.—Assessed the importance of (a) the presence of shock and (b) the presence of an avoidance contingency in determining the control of treadle-pressing by the auditory or the visual component of a compound auditory-visual discriminative stimulus. In Exp I 6 naive male White Carneaux pigeons pressed a foot treadle in the presence of a compound stimulus to avoid extinction for keypecking, and in Exp II 4 other Ss pressed the treadle in the compound to avoid punishment of keypecking by electric shock. In both cases, treadle-pressing was predominantly controlled by the visual component of the compound stimulus. In Exp III 6 additional Ss pressed the treadle in the presence of the compound to obtain grain; intertrial responses were punished by electric shock. As in Exps I and II, treadle-pressing was controlled primarily by the visual component of the compound stimulus. It is hypothesized that the common element in the 3 procedures—the presence of food reinforcement—determined control by the visual element.—*Journal abstract*.

9156. Holland, Peter C. & Rescoria, Robert A. (Yale U) **Second-order conditioning with food unconditioned**

**stimulus.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 459-467.—3 experiments investigating 2nd-order conditioning were conducted with a total of 72 male Sprague-Dawley rats. An appetitive Pavlovian conditioning situation was employed in which the response measure was the amount of general activity. Exp I provided a well-controlled demonstration of substantial 2nd-order conditioning. In Exp II extinction of the 1st-order conditioned stimulus (CS) had no effect upon the response to the 2nd-order CS. Exp III examined the relationship of the 2nd-order conditioning paradigm to that of conditioned inhibition. Both phenomena could be observed simultaneously in the same setting. Implications for 2nd-order conditioning and related conditioning phenomena are discussed. (16 ref)—*Journal abstract*.

9157. Hornbuckle, Phyllis A. & Beall, Thomas. (Virginia Commonwealth U) **Escape reactions to the blood of selected mammals by rats.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 573-576.—15 female Holtzman rats were placed on an elevated glass surface which was coated with either Holtzman rat blood, Long-Evans rat blood, mouse blood, human blood, or distilled water. Ss' escape latencies from these substances were recorded and compared. Both strains of rat blood and the mouse blood elicited significantly faster escape latencies than the distilled water, while human blood did not. The possibility that only the blood of organisms sharing a common habitat or common predators may normally elicit escape responses is suggested.—*Journal abstract*.

9158. Hull, John H. & Myer, James S. (Kent State U) **Effects of prior discriminative stimulus and reinforcer presentation on acquisition of instrumental responding in rats.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 437-440.—Independent groups of female Long-Evans rats ( $N = 88$ ) underwent various pretraining procedures involving key light illumination and presentation of food before introduction of instrumental conditioning in which food reinforcement was immediately contingent upon pressing the illuminated key. Results show that key illumination followed immediately by food presentation produced facilitation of subsequent acquisition of instrumental responding which increased with 0, 10, 50, and 200 pretraining trials; the facilitation effect of 1,000 pairings of key illumination and food was no greater than that of 200 pairings. The facilitative effect of key illumination and food presentation upon subsequent instrumental learning was the same regardless of whether food presentations in pretraining immediately accompanied illumination offset or were delayed for 8 sec. Food presentations alone on 10, 50, or 200 pretraining trials facilitated subsequent instrumental learning less than equivalent numbers of presentations of illumination and food, but 200 presentations of food alone facilitated subsequent instrumental learning more than 0 pretraining trials.—*Journal abstract*.

9159. Huston, J. P.; Mondadori, C. & Waser, P. G. (U Zurich, Inst of Pharmacology, Switzerland) **Facilitation of learning by reward of post-trial memory processes.** *Experientia*, 1974, Vol 30(9), 1038-1040.—Investigated the effect of operant conditioning rewards on the period of memory consolidation in albino mice. 927 Ss, some previously deprived of food, were trained in the 1-trial

passive avoidance step-down task and given a food reward at various times after the learning trial. 24 hrs later, step-down latencies were re-recorded. Results indicate that rewards given after 20, 30, and 50 sec showed significantly longer latencies ( $p < .001$ ). At 60- and 80-sec delays, the reward had the opposite effect. It is concluded that the administration of a reward at a critical period after a passive avoidance trial facilitates performance upon recall. (German summary) (30 ref)—*R. Tomasko*.

9160. Jackson, Donald E. (Eastern Michigan U) **CS-free food contingencies and subsequent acquisition of conditioned suppression: No transfer effect.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-A), 235-236.—Conducted a study of 32 male albino Sprague-Dawley rats to test the generality of the transfer-of-control phenomenon, using Ss in a conditioned suppression paradigm. Following VI training for food, 32 rats received 12 conditioned stimuli (CSs)—levers retracted—over 2 days, during which 3 of 4 groups received free food. CS-free food contingencies were positive, negative, or absent; the 4th group received CSs alone. Subsequent conditioned emotional response (CER) acquisition (3 days) on the baseline reveal only a significant trials effect.—*Journal abstract*.

9161. Kehoe, E. James & Gormezano, I. (U Iowa) **Effects of trials per session on conditioning of the rabbit's nictitating membrane response.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 434-436.—Conducted a study of 48 albino rats to determine the effects of 1, 5, 10, and 50 conditioning trials per session on classical conditioning of the rabbit's nictitating membrane response. It was found that single-trial sessions produced more rapid increases in conditioned response (CR) frequency across trials and required fewer trials to attain criterion performance than multiple-trial sessions. The finding of a superiority of single-trial sessions on CR acquisition is discussed with regard to traditional accounts of trial distribution effects on learning (i.e., reactive inhibition, stimulus sampling, and consolidation hypothesis), as well as with regard to stimulus variability accounts. (16 ref)—*Journal abstract*.

9162. Keith-Lucas, Timothy & Guttman, Norman. (U of the South) **Robust-single-trial delayed backward conditioning.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 468-476.—80 female albino rats, shocked once while eating in the presence of a novel stimulus panel, were exposed to a complex stimulus object after a blackout period of 1-40 sec. 40 other Ss served as controls. The next day Ss were observed in a test for differential avoidance of the shock location, the forward-order conditioned stimulus (CS) and the backward-order CS. On the basis of 5 different classes of behavior, Ss in the 1-, 5-, and 10-sec blackout groups avoided the backward-order CS rather than the shock location or the forward-order CS. The association does not appear to be based primarily on temporal sequence or the signaling relationship involved in Pavlovian conditioning. Instead, it appears that the association is dependent on the specific nature of the stimuli, possibly reflecting an evolved learning capability for associating noxious exteroceptive stimuli with predatorlike objects. (22 ref)—*Journal abstract*.

9163. Mager, P. P. (U Greifswald, Inst für Pharmakologie, E Germany) A note on the autoregressive process during the conditioned avoidance response in rats. *Experientia*, 1974, Vol 30(2), 154-155.—Trained 6 Drucker rats to avoid a 50-V footshock using a tone (conditioned stimulus; CS) and intertrial intervals of 10-90 sec. Reaction time (RT) from CS to avoidance was measured, and noncircular serial correlation coefficients of mean RT in each session were determined. Significant autocorrelations were found only during Days 4-7 of the 14-day training. This is interpreted as indication of 2 oscillatory processes occurring during conditioned avoidance response—one of spontaneous background activity in the central nervous system and the other a consolidation phase indicated by autoregressive periodicity on Days 4-7. It is proposed that unspecific activity is reduced during this phase to a level that makes optimum learning possible. (German summary)—C. Wright.

9164. Marrazo, Martin J. & Riccio, David C. (VA Hosp, Psychological Services, Albany, NY) Effects of location of response prevention upon extinction of instrumental avoidance in young and adult rats. *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 521-523.—Following acquisition of an avoidance response in a straight alley, 30 young and 30 adult male Holtzman rats received response prevention (blocking) either in the startbox or in the runway. For adults, both blocking locations yielded facilitated extinction compared with unblocked (regular extinction) controls, but blocking in the startbox was significantly more effective. In young Ss, only the startbox blocking condition reliably reduced later resistance to extinction.—*Journal abstract*.

9165. Matysiak, Jan; Jankowski, Kazimierz; Knoll, Elzbieta & Maszkiewicz, Krystyna. (Inst of Psychology, Children's Neuropsychiatric Sanatorium, Garwolin, Poland) [The effect of the kind of reinforcement during toilet training on dogs' behavior in a novel situation.] (Poln) *Przegląd Psychologiczny*, 1973, Vol 16(1), 19-28.—Divided 10 littermates into 2 equal groups by matching the frequency of their use of a litter-box. During 30 days of training 1 group was only rewarded for using the litter-box by patting and a piece of meat, and the other was in addition punished for not using it, 1st by a blow of air into the ear, and later by a rap of a rubber hose. The 2nd group decreased the number of errors only in the 3rd 10 days of training. After training, both groups showed signs of fear at sight of the rubber hose. The 2nd group had significantly longer latencies of advancing into an unknown area, and covered shorter distances than the 1st group. (English & Russian summaries)—I. Divac.

9166. Meltzer, Donald & Hamm, Robert J. (Southern Illinois U, Carbondale) Conditioned enhancement as a function of the percentage of CS-US pairings and CS duration. *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 467-470.—Trained 18 male hooded rats to barpress on a variable-interval 90-sec schedule of sucrose-solution reinforcement. Ss were then divided into 3 groups of 6 and exposed to a classical conditioning contingency while barpressing, in which a 2-min light conditioned stimulus (CS) preceded the delivery of a

food pellet unconditioned stimulus (UCS) on either 100, 66, or 33% of the CS presentations. When the response rate during the CS was compared to response rate prior to the CS, it was found that the CS response rate was directly related to the percentage of UCS presentation. When the CS duration was changed to 8 sec, the highest CS response rates were associated with the partial pairing of CS and UCS. (16 ref)—*Journal abstract*.

9167. Miller, Laurence. (Western Washington State Coll) Compounding of discriminative stimuli from the same and different sensory modalities which maintain responding on separate levers. *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 426-428.—29 male Holtzman albino rats barpressed for food during light or tone or 2 separate lights. Each stimulus maintained responding on a separate lever. In Phase 1, 1 lever and its correlated stimulus appeared during a session. In Phase 2, both levers were concurrently exposed and each stimulus appeared. Results show that when light and tone were combined in Phase 1, responding increased with either lever exposed. Responding also increased during compounding in Phase 2, but nearly all responses occurred on the light-correlated lever. When the 2 lights were combined in Phase 1, no change in responding occurred with either lever present, regardless of the intensity of each light. No change in responding also occurred during compounding in Phase 2 with lights of different intensity. However, responding increased significantly with lights of equal intensity. There was no significant difference in the number of responses emitted on each lever with either set of intensities.—*Journal abstract*.

9168. Mineka, Susan & Seligman, Martin E. (U Wisconsin) Conditioned drinking as avoidance learning. *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 69-80.—Conducted 4 experiments with a total of 104 male Sprague-Dawley albino rats. Blocking the robust conditioned drinking response following conditioning eliminated the isotonic procaine conditioned response (CR) but not the hypertonic procaine CR. Ss allowed to drink in the box during conditioning formed a larger CR than Ss merely injected with hypertonic or isotonic procaine who were prevented from drinking in the box: response blocking during extinction eliminated the latter CR. The CR to hypertonic procaine could also be eliminated if no experience of drinking water in the box occurred either during baseline or during conditioning. Blocking the drinking response, like blocking shock avoidance, markedly reduced its high resistance to extinction. Results suggest that rats overdrink to avoid anticipated illness, and fail to extinguish partially because they are never exposed to the fact that no illness will occur even if no drinking occurs.—*Journal abstract*.

9169. Mitchell, Denis; Kirschbaum, E. H. & Perry, Roseanna L. (U Washington) Effects of neophobia and habituation on the poison-induced avoidance of exteroceptive stimuli in the rat. *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Jan), Vol 104(1), 47-55.—Gave 20 male Long-Evans rats in Exp 1 either 10 or 25 days of habituation to the test situation prior to conditioning. Those Ss with the longer habituation period avoided a complex of novel exteroceptive

stimuli while those with the shorter habituation period did not. In Exp II 30 Ss initially avoided the more novel of 2 containers but gradually came to eat equal amounts from both. A single pairing of toxicosis with consumption from either the novel or the familiar container reinstated the avoidance of the novel container in both cases. Results suggest that previously reported differences between interoceptive and exteroceptive conditioning effects may have been influenced by the differential novelty of the 2 classes of stimuli in the test situation. It is further suggested that noncontingently poisoned control groups should routinely be included in poison avoidance conditioning studies. (43 ref)—*Journal abstract*.

9170. Moot, Seward A.; Nelson, Kelly & Bolles, Robert C. (U Washington) **Avoidance learning in a black and white shuttlebox.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 501-502.—Studied possible reasons for the poor avoidance performance of rats in a heterogeneous black-white shuttlebox reported by R. G. Weisman et al (see PA, Vol 41:4306). Little evidence of this decrement was found when 24 female Long-Evans rats were free to make intertrial responses. There was a general deficit in learning when a door was used to prevent intertrial responding, however, and this deficit was greater when the Ss were confined in the black-white apparatus.—*Journal abstract*.

9171. Myerson, Joel. (U California, Berkeley) **Lever-pecking elicited by signaled presentation of grain.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 499-500.—In an experiment with 1 White Carneaux pigeon, the pairing of a keylight with food elicited downward-pecking movements directly in front of the key. These pecks were recorded, using an appropriately positioned lever. Leverpecks and keypecks, which developed later, were maintained by stimulus-reinforcer pairings; occurrence of either response extended the trial duration and postponed food, thereby precluding adventitious reinforcement. Results suggest that movements, approach to the key, and keypecking may be considered 3 distinct response classes, because approach to the key does not insure that ongoing pecking will be directed at it.—*Journal abstract*.

9172. Parker, Adrian. (U Edinburgh, Scotland) **ESP in gerbils using positive reinforcement.** *Journal of Parapsychology*, 1974(Sep), Vol 38(3), 301-311.—Trained 3 gerbils in a task involving a choice between 2 keys, one of which produced a reward of sunflower seeds if pressed. Determining which of the 2 keys (right or left) would yield a reward was completed automatically by a random sequence of holes and spaces on a paper-punch tape. Random behavior trials (RBTs) were defined to be trials in which the S changed to the other key from that key on which it had been rewarded in the previous trial. It was found that the Ss obtained significantly more than the chance number of rewards in both RBTs and non-RBTs. The scoring rate in overall trials was 52.6%, with RBTs producing a slightly higher scoring rate (55%) than non-RBTs (52%).—*Journal abstract*.

9173. Pliskoff, Stanley S. & Gollub, Lewis R. (U Maine, Orono) **Confidence lost and found, or, Is the organism always right?** *Psychological Record*, 1974(Fal), Vol 24(4), 507-509.—Discusses some previous data

obtained by the authors in an operant keypecking experiment with 2 pigeons. Data from 1 pigeon appeared routine, while that from the 2nd pigeon showed no rate change. Reasons for the peculiar data are offered, and it is concluded that the organism is always right.

9174. Porter, Richard H. & Treadway, Jerry T. (George Peabody Coll, John F. Kennedy Ctr for Research on Education & Human Development) **Effects of previous exposure on olfactory discrimination in *Acomys cahirinus*.** *Nature*, 1974(May), Vol 249(5453), 157-158.—Studied the effects of previous exposure to one or both olfactory discriminanda upon subsequent discrimination of olfactory stimuli. 8 nocturnal mice in each of 3 treatment conditions were studied. Groups were exposed to one, both, or neither of the olfactory stimuli for 7 days before the time of testing. During discrimination testing, the 2 odors were blown into opposite ends of the runway, and 2 small food cups containing a piece of apple as a reward were placed into the runway, one at each end. To obtain the apple reinforcement, the mouse had to approach the appropriate odor of the 2 being emitted into the T maze. Results indicate that spiny mice learn to discriminate between a familiar and novel odor faster than they learn to discriminate between 2 unfamiliar odors. Possible explanations are discussed with reference to other relevant literature and research.—R. S. Albin.

9175. Rescorla, Robert A. & Heth, C. Donald. (Yale U) **Reinstatement of fear to an extinguished conditioned stimulus.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Jan), Vol 104(1), 88-96.—Conducted 4 experiments with a total of 120 male Sprague-Dawley rats, the results of which demonstrate the ability of an unconditioned stimulus (UCS) presentation following extinction to partially reinstate the conditioned response. These experiments are interpreted in terms of the strengthening of an extinction-reduced UCS representation. The 1st 2 experiments offer alternative interpretations in terms of sensitization, reinstating the stimulus conditions of acquisition, conditioning of background cues, and stimulus generalization. Exp III suggests that reinstatement is possible with a UCS qualitatively different from that used in conditioning. Exp IV explored an alternative extinction procedure which preserved the conditioned stimulus-unconditioned stimulus association while encouraging modification of the UCS representation. Results are discussed both in terms of related empirical phenomena, such as spontaneous recovery and sensory preconditioning, and in relation to the general role of the UCS representation in conditioning. (17 ref)—*Journal abstract*.

9176. Revusky, Sam. (Memorial U Newfoundland, St John's, Canada) **Long-delay learning in rats: A black-white discrimination.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-B), 526-528.—Rats can associate between events separated by intertrial intervals as long as several hours. For instance, they can learn that the type of food reward on one trial in a runway is correlated with whether running will be rewarded on the following trial. They also can learn that they will be rewarded if they alternate responses in a T-maze. In the otherwise similar experiments reported here, more traditional discriminative stimuli were used with 4 female

Sprague-Dawley rats. Whether running down a runway was to be rewarded with sugar solution depended on whether the goalbox on the preceding trial, over 4 min ago, had been white or black. The Ss learned this discrimination and retained it through an extinction phase.—*Journal abstract.*

9177. **Schachter, Stanley & Rodin, Judith. Obese humans and rats.** Potomac, MD: Lawrence Erlbaum, 1974. ix, 182 p. \$10.95.—14 papers review and present new findings on the behavioral similarities of obese humans and animals whose ventromedial hypothalamic nuclei (the "feeding center") have been lesioned. A theoretical framework which synthesizes animal and human data is presented which suggests that the relationship of cue prominence and probability of response is stronger for the obese than for normals. 9178. **Shettleworth, Sara J.** (U Toronto, Ontario, Canada) **Reinforcement and the organization of behavior in golden hamsters: Hunger, environment, and food reinforcement.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975 (Jan), Vol 104(1), 56-87.—The effects of food deprivation, feeding regime, exposure to a strange environment, and free food on the behavior of a total of 46 hamsters were studied in 3 experiments. Behavior was recorded as 20-24 mutually exclusive, exhaustive action patterns (APs). Certain APs, chiefly those involving locomotion and active contact with the environment, increased in food-deprived Ss near feeding time while others, including grooming APs and scent marking, were depressed. In Exp IV additional, hungry Ss were reinforced with food for accumulating time performing 1 of 6 of the APs. 3 showed large immediate increases in rate and tended to increase in bout length. The other 3 showed at best small delayed increases in rate and tended to decrease in bout length. The APs that showed large effects of food reinforcement were facilitated by hunger in the 1st 3 experiments, and those that showed small effects were depressed. An incentive-motivational mechanism is suggested in which the classically conditioned component facilitates only behaviors appropriate to anticipation of the reinforcer rather than any reinforced response, as is usually assumed. (60 ref)—*Journal abstract.*

9179. **Siegel, R. K. & Jarvik, M. E.** (U California, Los Angeles) **Learning in the land snail (*Helix aspersa* Müller).** *Bulletin of the Psychonomic Society*, 1974 (Nov), Vol 4(5-A), 476-478.—Discusses 2 experiments which demonstrate avoidance learning in land snails ( $N = 40$ ). Exp I utilized the snail's negative geotaxis and its chemoreceptive characteristics, and required the Ss to climb a vertical pole which contained a quinine-saturated loop of thread at the top. Exp II substituted electric shock loops for the quinine. Ss in both experimental groups manifested progressively increasing climbing latencies and avoidance responses throughout 5 successive training sessions and a 1-wk retention test. Control Ss which received noncontingent quinine or shock did not show evidence of learning. Results provide evidence of rapid avoidance learning in gastropod mollusks.—*Journal abstract.*

9180. **Smith, Stanley G. & Davis, W. Marvin.** (U Mississippi) **Punishment of amphetamine and morphine**

**self-administration behavior.** *Psychological Record*, 1974 (Fall), Vol 24(4), 477-480.—Studied the effectiveness of shock punishment on self-administration of morphine and amphetamine in 2 groups of 14 adult male Holtzman rats. Each group was reinforced for leverpresses in a Skinner box first with saline and then by either a 60 mcg/kg dose of morphine or amphetamine sulfate. Punishment contingencies were introduced after the last 3-hr acquisition period; 3 acquisition and 3 punishment sessions were used for each group of Ss. Results indicate that shortly following initial acquisition of the behavior, the punishment contingency quickly suppressed self-administration of the 2 drugs. Implications for treatment of self-administration of drugs in humans are discussed.—*L. Gorsey.*

9181. **Solomon, Paul R.; Brennan, George & Moore, John W.** (U Massachusetts, Amherst) **Latent inhibition of the rabbit's nictitating membrane response as a function of CS intensity.** *Bulletin of the Psychonomic Society*, 1974 (Nov), Vol 4(5-A), 445-448.—Reports results of 2 experiments with a total of 80 New Zealand rabbits. In Exp I a series of 450 pre-exposures to a tone conditioned stimulus (CS) retarded subsequent conditioning of the Ss' nictitating membrane response. Retardation relative to non-pre-exposed controls was observed with strong (95 db) as well as weak (75 db) tones. A subsequent experiment involving summation tests in which the tone was compounded with an excitatory (light) CS as a function of tone intensity suggested that pre-exposure resulted in a loss of salience rather than active inhibition.—*Journal abstract.*

9182. **Spatz, H. Ch.; Emanns, A. & Reichert, H.** (U Freiburg, W Germany) **Associative learning of *Drosophila melanogaster*.** *Nature*, 1974 (Mar), Vol 248(5446), 359-361.—Attempted to demonstrate associative learning in *Drosophila melanogaster* as the basis for a genetic study of the mechanism of information acquisition and storage. *Drosophila* strains wild type (Berlin) and ebony, aged between 1 and 10 days after eclosion, were kept on standard media. For each run, approximately 300 Ss were placed in the starting unit of a T maze, from which they could move freely into a training alley consisting of 2 narrow funnels capable of administering electroshock and of exposing the Ss to an intense blue or yellow light. After passing through the training alley the Ss reached a T unit where they could choose to proceed through a blue or through a yellow funnel constructed and illuminated exactly as in the training alley. Comparison of the behavior of the shocked test groups and the unshocked control group indicates that both *Drosophila* strains avoided the optical stimuli ( $P < .01$ ). It is concluded that the Ss did learn to associate the lights with electroshocks.—*B. Lindsey.*

9183. **Sutherland, C. J. & Zbrozyna, A. W.** (U Birmingham, Medical School, England) **Extinction of the vasodilator component of the defense reaction in the cat.** *Experientia*, 1974, Vol 30(1), 49-50.—Investigated the extinction of the vasodilator response of the cat to threatened aggression. 3 cats were exposed to repeated visual confrontation with a threatening dog for 6 days. Visual observations of the Ss' behavior were correlated with measurements of arterial blood pressure, external iliac blood flow, heart rate, electromyographic activity in

the hindlimb, and the respiratory rate. The Ss' threatening posture continued with undiminished intensity throughout the 6 days, though by the 4th day vasoconstriction rather than vasodilation appeared in the hindlimb. Results indicate that muscle vasodilation was the easiest component of the cat's defense reaction to be extinguished, as long as no noxious stimulation followed the conditioned visual stimulus. (French summary)—R. Tomasko.

9184. Taylor, George T. (State University Coll New York, Potsdam) **Discriminability and the contrafreeloading phenomenon.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 104-109.—According to previous reports of the contrafreeloading phenomenon, animals will work for a reward, and sometimes work quite hard, in the presence of the same reward available freely. Results of the present 2 experiments with a total of 21 male Holtzman albino rats suggest that the contrafreeloading data are explainable with a basic learning principle, discriminability, and its accompanying response decrement. For some Ss the change in stimulus conditions with introduction of free water was made more highly discriminable by a change in earned reinforcement conditions. The other Ss remained on the same earned reinforcement conditions under which all the Ss had been trained. Findings demonstrate that the discriminability between the conditions of working and freeloading was a most important factor contributing to the continued responding in the presence of free rewards. (18 ref)—*Journal abstract*.

9185. Tennant, W. A. & Bitterman, M. E. (U Hawaii) **Blocking and overshadowing in two species of fish.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Jan), Vol 104(1), 22-29.—In Exp I a mixed blocking-overshadowing effect of color on an auditory discrimination was demonstrated in 13 goldfish. In Exp II (with lines differing in color and angle), blocking of angle by color and of color by angle was demonstrated in 12 additional goldfish. In Exp III (again with lines differing in color and angle), overshadowing of angle by color was demonstrated in 12 carp, but these, like goldfish, failed to show greater intra- than extradimensional transfer. Results are consistent with the hypothesis that blocking and overshadowing are general phenomena of vertebrate learning. They suggest that the processes responsible for blocking and overshadowing are different from those which produce the dimensional transfer effect.—*Journal abstract*.

9186. Topping, Jeff S. & Ford, Thomas W. (Mississippi State U) **Response elimination with DRO and extinction: A within-subject comparison.** *Psychological Record*, 1974(Fal), Vol 24(4), 563-568.—3 male White King pigeons initially received nondifferential reinforcement training for keypecking on a 3-component multiple schedule, with identical variable-interval 30-sec schedules in effect in each component. Following response rate stabilization in each component, the reinforcement contingencies were changed in 2 components. In one, reinforcement occurred whenever a response was not emitted for a designated time interval; in the other, reinforcement was no longer available. Responding was eliminated faster with the differential-reinforcement (DRO) schedule than with extinction in all Ss, and

response rates above baseline consistently developed in the unaltered component. Findings from a retention test indicate that response elimination was very durable with DRO, whereas spontaneous recovery occurred with the extinction schedule.—*Journal abstract*.

9187. Wasserman, Edward A. & Molina, Enrique J. (U Iowa) **Explicitly unpaired key light and food presentations: Interference with subsequent auto-shaped key pecking in pigeons.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Jan), Vol 104(1), 30-38.—Previous research has shown that prior training involving explicitly unpaired key light and food presentations later interferes with autoshaping the pigeon's keypeck. The present 3 experiments with a total of 34 naive pigeons identified 2 separable characteristics of this interference: delayed initiation of keypecking and reduction in the postacquisition level of keypecking. The 1st characteristic was specific to the pretraining stimulus but the 2nd was not. Findings are discussed in terms of conditioned inhibition and learned laziness. (23 ref)—*Journal abstract*.

9188. Wiltz, Robert A. et al. (Comprehensive Mental Health Board of Central Illinois, East Peoria) **Generalization gradients and combined-stimulus control after equal training with two related stimuli: II. Effects of "errorless" training: III. Effects of chlorpromazine.** *Psychological Record*, 1974(Fal), Vol 24(4), 449-468.—For 2 groups of 8 male White Carneaux pigeons, each of 2 differentially positioned stimulus lamps were correlated with identical reinforcement schedules, and the absence of both lamps signalled extinction. Keypecking responses of 1 group were brought under stimulus control by a procedure which initially resulted in many "errors." The 2nd group's responses were brought under control by a "fading" procedure, and few errors occurred. In Exp I both the intermediate stimulus and the combined stimuli controlled higher response rates than the single training stimuli, and other stimuli controlled lower rates. In Exp II, chlorpromazine reduced responding during the stimuli correlated with reinforcement but had no effect on responding during the stimulus signalling extinction. Results emphasize the importance of terminal performance as a variable in "errorful" vs errorless discrimination learning. (27 ref)—*Journal abstract*.

9189. Wong, Roderick & Oguzsoff, Susan. (U British Columbia, Vancouver, Canada) **Note on sex difference, early experience and food intake in rats.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 841-843.—Long-Evans hooded rats which received either pre- or postweaning stimulation were compared with controls for 11 days on a 10-min feeding test. Results indicate that although males consumed more wet mash than females, the nonstimulated controls ate as much as did Ss in the 2 experimental groups. When body weight differences between the sexes were taken into account in the analysis, the food consumption of female Ss was found to be equivalent to that of the males. (26 ref)—*Journal abstract*.

### Social & Sexual Behavior

9190. Bauer, R. & Kramer, B. (CNRS, Lab de Physiologie Nerveuse, Gif-sur-Yvette, France) **Agonistic**

behaviour in mormyrid fish: Latency: Relationship between the electric discharges of *Gnathonemus petersii* and *Mormyrus rume*. *Experientia*, 1974, Vol 30(1), 51-52.—Studied the role of electric organ discharge in communication by examining the latency relationship between the pulses of a *G. petersii* and an intruding *M. rume*. A successive 5 day series of experiments was performed using a tank with 120 wires forming a regular array on each of the 6 surfaces. The potentials resulting from each of the fishes' discharges were amplified and displayed on an oscilloscope. The *G. petersii* responded to the *M. rume*'s exteroceptive electric stimulus, as perceived through its electroreceptors, by an electric organ discharge within 11 msec. This observation indicates the existence of an extremely rapid reflex arc. (German summary)—*R. Tomaska*.

9191. Bernstein, Irwin S.; Gordon, Thomas P. & Rose, Robert M. (U Georgia) Aggression and social controls in rhesus monkey (*Macaca mulatta*) groups revealed in group formation studies. *Folia Primatologica*, 1974, Vol 21(2), 81-107.—Investigated formation of 5 groups of rhesus macaques totalling 132 Ss. Groups were formed both by introducing individuals and by merging established groups. Initial exploration was followed by agonistic (aggressive and submissive) behavior. Adult males were most aggressive in initial fighting, but few serious wounds resulted and contact aggression waned rapidly. Frequency of agonistic behavior by females gradually increased and eventually exceeded that of males. Defeated, nonresisting Ss were attacked principally by females. Rank stability was greater among females than males. Merging of established groups resulted in inversion of dominance rank of several males. All-male groups were formed with little injury and fighting, but the addition of females increased the frequency of aggression, in part by their enlistment of males to attack other males. Fighting among males was not due to sexual competition. Ss raised in social isolation were unable to form a cohesive social unit. Initial agonistic interactions established the social order of emerging groups. As groups organized, extreme forms of aggression disappeared and frequency of aggression declined. Social mechanisms which inhibit aggression appear to be inherent in the organization of macaque groups. (25 ref)—*W. K. Redican*.

9192. Chase, Ivan D. (Dartmouth Coll) Models of hierarchy formation in animal societies. *Behavioral Science*, 1974(Nov), Vol 19(6), 374-382.—Discusses 2 models—round robin and correlation—that have been proposed to explain the process of hierarchy formation. It is demonstrated that both models require stringent mathematical conditions to predict linear and near-linear hierarchies, and that available data indicate that these conditions are not met. Most of the data cited are from studies of dominance in chickens, but it is suggested that the same mathematical conditions are necessary to generate linear and near-linear hierarchies by the round robin and correlational models in any species.—*Journal abstract*.

9193. Cone, Al L. (Lynchburg Coll) Maternal retrieving behavior in rats as predicted by locomotor activity and weight of six-day-old pups. *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-A), 233-234.—Exam-

ined several characteristics of 88 6-day postpartum rat pups to determine whether any combination of characteristics permitted reliable prediction of the retrieval behavior of 10 primiparous Charles River albino rat mothers. On the 6th day postpartum, retrieval latencies, body weights, and 2 activity measures were quantified for the pups. Sex of the pups was identified on the 22nd day and stepwise linear regression analyses were performed. Results show that if individual differences among mothers were ignored, the best predictor of retrieval latency was pup activity—mothers retrieved their less active pups faster; if individual differences were held constant, mothers retrieved their lighter pups faster. These findings are in contrast to studies in which inactivity was experimentally produced by killing or sedating the pups as well as to popular legends which assert that mother animals give preferential treatment to their stronger pups.—*Journal abstract*.

9194. Dewsbury, Donald A. & Lovecky, Deirdre V. (U Florida) Copulatory behavior of old-field mice (*Peromyscus polionotus*) from different natural populations. *Behavior Genetics*, 1974(Dec), Vol 4(4), 347-355.—Compared the copulatory behavior of *Peromyscus polionotus* from South Carolina and from Santa Rosa Island, Florida, with that of *P. polionotus* from the Ocala National Forest, Florida. 12 male and 16 female South Carolina mice received 71 tests, and 5 male and 3 female Santa Rosa mice received 18 tests. The basic pattern was identical across all 3 samples, being characterized by no lock, no intravaginal thrusting, multiple intromissions, and multiple ejaculations. Prolonged intromissions followed organized ejaculatory series. Quantitative differences among samples were found for several measures. Intromission frequency appears particularly susceptible to local variation. Between-population differences in copulatory behavior appear to be of a quantitative rather than a qualitative nature.—*Journal abstract*.

9195. Fox, M. W.; Lockwood, R. & Shideler, R. (Washington U) Introduction studies in captive wolf packs. *Zeitschrift für Tierpsychologie*, 1974(Aug), Vol 35(1), 39-48.—Introduced 1-yr- and 3-yr-old wolves of different rank and sex into the home cage of 2-yr-old wolves of known rank. Reverse tests were also run (resident test wolf placed in stranger's home cage). High-ranking residents were more aggressive than low-ranking residents toward strangers; the resident alpha female was most aggressive toward strangers (even in the latter's home cage) and when paired with the alpha male from her pack, tended to potentiate (incite) his aggression toward strangers. Yearling wolves showed more fear and defensive aggression than 3-yr-olds, some of the latter showing attack-inhibiting "passive indifference." Alpha male and female yearlings, in the presence of an aged leader wolf in their home cage, were dominant over 2-yr-olds, but when alone in the latter's cage, were subordinate. The possibility of 2 separate groups or packs having the potential for integration through each having a social bond with 1 old wolf is considered. (German summary)—*Journal summary*.

9196. Grotta, Lee J. & Ader, Robert. (U Rochester, Medical Ctr) Behavior of lactating rats in a dual-chambered maternity cage. *Hormones & Behavior*, 1974(Dec), Vol 5(4), 275-282.—Videotape sampling of

the behavior of female Charles River rats in a dual-chambered apparatus indicated that the continuous monitoring of the amount of time a mother spent in the cage with its litter could be taken as a valid reflection of maternal behavior. Nursing was the principal behavior of lactating females while in the compartment with their litters; lying still, consummatory behavior, and activity occurred with greater frequency in the cage away from the litter. Both the time that mothers spent with their litters and their nursing behavior displayed a 24-hr rhythm with crest values occurring during the period of light.—*Journal abstract.*

9197. Hill, James L. (Michigan State U) **Peromyscus: Effect of early pairing on reproduction.** *Science*, 1974(Dec), Vol 186(4168), 1042-1044.—Sibling mating in 4 groups of bisexual pairs of deer mice (*Peromyscus maniculatus bairdi*) resulted in poor reproductive performance. Siblings paired before puberty exhibited delayed reproduction when adult. It is concluded that a behavioral mechanism is involved in this reproductive delay, since prepubertal familiarity also delayed reproduction in nonsibling pairs. Such a reproductive delay may act to reduce inbreeding depression and regulate population growth. (17 ref)—*Journal abstract.*

9198. Howard, John W. (U Oregon) **Dominance and relation coloration in green sunfish, *Lepomis cyanellus*.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 559-565.—Established 6 green sunfish as residents of a community aquarium and observed dominance relationships. Independent judges rated relative coloration of the fish, and comparisons were made between coloration and dominance rank. When dominance rank was manipulated by exposing the most dominant fish to larger fish in another tank, then replacing him in the study tank, relative coloration correlated perfectly with dominance rank. "Food dominance" was independent of size, coloration, and spatial dominance.—*Journal abstract.*

9199. Hull, Elaine M.; Chapin, Elizabeth & Kastaniotis, Chris. (State U New York, Buffalo) **Effects of crowding and intermittent isolation of gerbils (*Meriones unguiculatus*).** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 723-727.—50 female and 46 male gerbils were reared from weaning to adulthood in mixed-sex paired, crowded, or isolate-crowded conditions, the latter consisting of placing crowded Ss into individual boxes for 2 hrs/day. Paired males exhibited more ventral marking and nonaggressive contact in social interaction tests; paired females were far more successful reproductively than either crowded group. Isolate-crowded males were more aggressive in the home cage and in social interaction tests, and isolate-crowded females were somewhat less successful reproductively than crowded females. The only anatomical or biochemical differences among groups were heavier testes in paired males and heavier body weights in crowded males. Reproductive failure and decreases in behavioral measures were not mediated by adrenal steroids. The isolate-crowded conditions aggravated the effects of crowding, rather than decreasing them. (22 ref)—*Journal abstract.*

9200. Lamb, Michael E. (Yale U) **Physiological mechanisms in the control of maternal behavior in rats: A review.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 104-119.—Examined the evidence derived from 2 types

of studies—those employing lesion techniques and those manipulating hormonal levels. The hormone studies suggest that prolactin, progesterone, and estrogen—and maybe another, as yet unidentified substance—play a coordinated role in the initiation of maternal behavior. Though the lesion studies are inconclusive, the evidence suggests that lesions of the hypothalamic-pituitary system, which maintains the hormonal balance, produce deficits in the motivational aspects of maternal behavior, whereas lesions of the limbic system produce deficits in the integration and organization of the behavior. It is suggested that researchers specify the deficits they find and assess the possible disruption of other behavior patterns, so that valid conclusions can be reached about functional specificity in the control of maternal behavior. (145 ref)—*Journal abstract.*

9201. Lippert, Wolfgang. (Tierpark, Berlin, E Germany) **[Observations on behavior during pregnancy and birth in orang-utans (*Pongo pygmaeus*) at Tierpark, Berlin.]** (Germ) *Folia Primatologica*, 1974, Vol 21(2), 108-134.—Describes pregnancies and births among 5 female Sumatran orang-utans in a zoo. Genital swelling (edema of labia majora) appeared 28-40 days after the absence of a menstrual period, and it increased as pregnancy progressed. Fluctuating labor pains were evident 8 days before birth. A spontaneous and a very difficult birth are described in detail. Estimates of birth date based on appearance of genitalia were more accurate than those based on menstrual cycles. (15 ref)—*English summary.*

9202. McLean, R. B. (Florida State U) **Direct shell acquisition by hermit crabs from gastropods.** *Experientia*, 1974, Vol 30(2), 206-208.—Describes the observed acquisition by hermit crabs of new shells from gastropods just killed by natural predators. A dominance hierarchy was noted among 4 species of hermit crabs in the acquisition process. A chemical stimulant eliciting harassment behavior is posited.

9203. Möglich, M.; Maschwitz, U. & Hölldobler, B. (U Frankfurt, Frankfurt am Main, W Germany) **Tandem calling: A new kind of signal in ant communication.** *Science*, 1974(Dec), Vol 186(4168), 1046-1047.—Observation of *Leptothorax acervorum*, *L. muscorum*, and *L. nylanderii* revealed that these species recruit nest mates to a new food source by tandem running, with only 1 nest mate being recruited at a time. This technique is initiated by a special "tandem calling" behavior; the recruiter slants its gaster upward and discharges poison gland secretions from the extruded sting. Nest mates are attracted, and as soon as one of them touches the calling ant, tandem running starts. Further details of the full recruitment sequence are provided. Evidence is presented to suggest that tandem running is the evolutionary precursor of odor-trail communication and sex attraction within certain phylogenetic lines of myrmicine ants.—*Journal abstract.*

9204. Parzefall, Jakob. (U Hamburg, Zoologisches Inst und Museum, W Germany) **[Reduction of aggressive behavior patterns in a cave form of *Poecilia sphenops* (Pisces, Poeciliidae).]** (Germ) *Zeitschrift für Tierpsychologie*, 1974(Aug), Vol 35(1), 66-84.—In contrast to 2 epigeal populations, males in 3 populations of the cave form of *Poecilia sphenops* showed a gradual

reduction of aggressive behavior although their optic orientation was apparently undisturbed. Breeding the cave form fish in daylight or rearing them with epigeal-form fish had no effect on aggressiveness. On coming into contact with the epigeal form, the cave form usually reacts with sexual behavior. In darkness the epigeal population does not exhibit any aggressive behavior except tailbiting. Presumably the aggressive behavior in *P. sphenops* depends mainly on optic release mechanisms. In the cave biotope this behavior obviously lost its biological significance and could then be reduced. The process of reduction is explained by the absence of selectional pressures preserving aggression. (25 ref)—*English summary*.

9205. Polsky, Richard H. (Uffculme Clinic, Ethology Lab, Birmingham, England) **Hunger, prey feeding, and predatory aggression.** *Behavioral Biology*, 1975(Jan), Vol 13(1), 81-93.—Reviews the research, discussing specifically the effects hunger and prey feeding have on the development and maintenance of the mammalian killing response. Findings are dichotomized into those which suggest a positive relationship between these 2 variables and killing, and those which negate a relationship. Those findings which suggest no relationship are drawn from the neurophysiological literature as well as from research which shows that experienced killers will kill in surplus, that the act of killing does not potentiate feeding, that nonkillers cannot be induced to kill through starvation, that experienced killers may not eat the prey after their first kills, and that experienced killers do not have to feed on the prey in order to maintain the killing response. Findings suggest that killing is self-reinforcing, and studies are reviewed which buttress this belief. Studies which support the view that hunger, feeding, and killing are positively related come from research in which naive animals were either starved or fed dead prey prior to the initial test for prey killing. It is concluded that hunger and feeding are not needed in order to maintain the killing response in the experienced killer, but both can serve as potentiators for the induction of killing in the naive S. (56 ref)—*Journal abstract*.

9206. Syme, G. J. & Syme, Lesley A. (Ruakura Animal Research Station, Hamilton, New Zealand) **The relationship between the peck order and performance in a competitive group feeding situation by two groups of cockerel.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 547-550.—Investigated group food competition in White Leghorn  $\times$  Australorp roosters. 2 groups of 8 and 7 Ss, respectively, were placed on a 33-hr food-deprivation schedule. Each group was required to compete for mash at a point source. In contrast to previous findings when a paired-comparison competitive technique was employed, a low correlation for both groups emerged between the peck order in nonfeeding situations and competitive performance. Aggression during competition also correlated poorly with competitive performance. Implications for the interpretation of the peck order as a general measure of social dominance are discussed.—*Journal abstract*.

9207. Taylor, George T. & Moore, Suzanne. (State University Coll New York, Potsdam) **Social position and competition in laboratory rats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 424-430.

—Conducted 2 experiments with male albino rats which controlled for social position (i.e., relative dominance-submission) in an appetitive social learning-performance setting. The 10 most dominant and 10 most submissive of 30 Ss were used in Exp I, and the 20 most dominant of 30 Ss were paired in Exp II. Results indicate that Ss which performed effectively when alone exhibited significantly reduced levels of responding when placed into a social environment. The severity of the response decrement was partly a function of the relative social position of the Ss involved. A dominant male made few responses when paired with another dominant male. Yet, a dominant S made even fewer responses when paired with a submissive S, which barpressed at approximately half the individual level. Findings suggest that social position, with its accompanying characteristic form of aggression, is an important determinant of performance in a social learning environment. (18 ref)—*Journal abstract*.

9208. Waser, Peter M. & Floody, Owen. (Rockefeller U, New York, NY) **Ranging patterns of the mangabey, *Cercocebus albigena*, in the Kibale Forest, Uganda.** *Zeitschrift für Tierpsychologie*, 1974(Aug), Vol 35(1), 85-101.—Studied daily movements and dispersion of a free-ranging group of mangabeys. The spatial organization of this group contrasted in several respects with patterns exhibited by other rain-forest monkeys; e.g., while other arboreal forest primates inhabit quite restricted areas, the home range of this group exceeded 34 ha and was comparable to the areas occupied by some open-country primates. Similarly, the extent of daily movements and the average spread of this group resembled those of terrestrial forms inhabiting relatively open terrain more than those of other arboreal forest-dwelling groups. Results indicate that arboreal rain-forest species may vary considerably with respect to spatial parameters such as home range, daily range, and group spread. Thus, theoretical positions or general assumptions suggesting that the social organizations of forest species are less variable than those of open-country primates require reconsideration. (German summary) (28 ref)—*Journal summary*.

9209. Wise, Larry A.; Zimmermann, Robert R.; Strobel, David A. & Smith, Olin W. (Texas Wesleyan Coll) **Device for study of communication of dominance without physical contact.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 863-866.—Compared dominance competition between 3 groups of 12 paired rhesus monkeys using a standard apparatus, the Wisconsin General Test Apparatus (WGTA) and a new device called the Parallel Competition Box. The Parallel Competition Box does not allow physical contact between individual Ss during testing as does the WGTA. Results comparing the Parallel Competition Box and the WGTA on food incentive competition indicate that physical contact is not necessary for assertion and maintenance of dominance between socialized rhesus monkeys.—*Journal abstract*.

9210. Worsley, A. (U Queensland, Animal Behaviour Unit, Brisbane, Australia) **Long-term effects of imprinting exposure upon breed discriminatory behaviour in chickens: II. Imprinting to the dam ("dampprinting").** *Zeitschrift für Tierpsychologie*, 1974(Aug), Vol 35(1).

10-22.—Investigated long-term effects of imprinting exposure to the dam ("damprinting") upon breed discriminatory behavior in Rhode Island Red (RIR) and Australorp chickens. In Exp I damprinting interacted with sex and breed factors to affect agonistic interactions during the 1st 13 wks of life. RIR males appear to have been most affected by damprinting, directing more agonistic interactions to their own breed when they had been exposed to a RIR dam than to an Australorp dam. In Exp II it was shown that the Breed Experience factor interacted with the Damprinting factor as well as with sex and breed. Results indicate that damprinting can have long-term effects upon breed discriminatory behavior and breed preference. These effects are modifiable, principally by subsequent breed experience. (German summary)—*Journal summary*.

9211. Worsley, A. (U Queensland, Animal Behaviour Unit, Brisbane, Australia) **Long-term effects of imprinting exposure upon breed discriminatory behaviour in chickens: I. Imprinting to peers ("peerprinting").** *Zeitschrift für Tierpsychologie*, 1974(Aug), Vol 35(1), 1-9.—Investigated the effects of early exposure to peers on subsequent breed discriminatory behavior in chickens. In Exp I, day-old Rhode Island Red (RIR) and Australorp chicks were exposed to peers ("peerprinted") in 4 different treatments. After 48-hr exposure, chicks of both breeds were reared together until maturity. It was found that males which had been exposed to 2 peers of their own breed directed more agonistic interactions to members of their own breed than did birds in the other preprinting treatments during the 1st 6-11 wks, but not afterwards. In Exp II, similarly peerprinted RIR cockerels were reared with members of their own breed only. Peerprinting exposure affected breed discriminatory (sexual) behavior at maturity. Thus, the intermingling of birds in Exp I may have been responsible for the diminution of the peerprinting effect in that experiment. (German summary) (18 ref)—*Journal summary*.

9212. Zack, Sheldon. (Max-Planck-Inst für Verhaltensphysiologie, Seewiesen, W Germany) **Sequences of agonistic behavior patterns and food deprivation in *Hermisenda*.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 525-532.—Food deprivation had little effect on the behavior patterns occurring during encounters between 2 *Hermisenda* molluscs. Deprivation did result in increased duration of bouts of certain behavior patterns, such as biting, and decreased durations of bouts of other patterns, such as withdrawal. The ability to predict which behavior pattern will follow another is unaffected by the food deprivation. On other measures, such as the sequential organization of the patterns occurring during an encounter (e.g., the differences in patterns of winners and losers), the food-deprived Ss were not significantly different from the controls. Measures taken on encounters 1 day after the end of the deprivation period generally fell between those of the deprived and control Ss, indicating that the effects of food deprivation were declining slowly.—*Journal abstract*.

9213. Zook, John M. & Adams, David B. (Duke U) **Competitive fighting in the rat.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 418-423.—Obtained competitive fighting in 29 of 60 pairs of like-sexed DA agouti laboratory rats by placing a single piece

of food into the food hopper following 48 hrs of food deprivation. The fighting was characterized by offensive sideways posture, full aggressive posture, and bite and kick attack. Tests were conducted at 110-120 days of age on pairs of Ss that had been housed together since weaning. Fighting was more frequent in pairs consisting of nonlittermates than in pairs of littermates, and it was equally frequent in male and female pairings. Probability of fighting was enhanced by prior experience with food deprivation, and attack was most often initiated by the heavier animal of the pair.—*Journal abstract*.

### Sensory Processes

9214. Afanador, Arthur J. & Adams, Anthony J. (Indiana U, Div of Optometry) **Early visual adaptation in goldfish retinal ganglion cells.** *Nature*, 1974(Jul), Vol 250(5464), 346-348.—Recorded transient losses of sensitivity at onset and offset of a 570-nm adapting light in 13 isolated goldfish retinal ganglion cells of the opponent center-surround type. A 480-nm test light stimulated the 530-nm excitatory cone system. Stimulation was focused on the center of the cell's receptor field under steady photopic background conditions. Results show that under transient and steady state adaptation conditions the range of incremental response from threshold to peak remained the same, with the operating range shifting along the intensity axis, consistent with a gain change. Implications for similar transient sensitivity changes in the human visual system are discussed. (16 ref)—*A. Cerf-Bearé*.

9215. Atkinson, R. J. (U Liverpool, Pt Erin, Isle of Man, England) **The activity rhythm of *Goneplax rhomboides* (L.).** *Marine Behaviour & Physiology*, 1974(Aug), Vol 2(4), 325-335.—Laboratory observation of *Goneplax* showed that this crab had a persistent nocturnal rhythm of emergence when maintained in constant conditions in an actograph providing a simulated burrow. The rhythm was synchronized by the light-dark cycle and appeared to be reinforced by contact with the burrow walls. The activity of an S seemed to be inhibited by the presence of others of the same species. The burrow is considered to play an important role in the life of the crab.—*Journal abstract*.

9216. Babighian, Gregorio; Moushegian, George & Rupert, Allen L. (U Padova, Verona, Italy) **Central auditory fatigue.** *Audiology*, 1975(Jan-Feb), Vol 14(1), 72-83.—Conducted experiments which recorded evoked and single-neuronal responses in 8 anesthetized Kangaroo rats. Results reveal that there is a central involvement in auditory fatigue. Cochlear potentials (microphonic and whole-nerve action potential) and inferior colliculus electrical responses were simultaneously obtained before and after excessive sound exposure. In general, sound exposure produced a greater reduction of the collicular evoked responses than of the cochlear microphonics and action potentials. Recordings from single neurons support the evoked-response findings. (French summary) (36 ref)—*Journal abstract*.

9217. Bridgeman, Bruce. (U California, Santa Cruz) **Correlates of metacontrast in single cells of the cat visual system.** *Vision Research*, 1975(Jan), Vol 15(1), 91-99.—23 curarized cats received light stimuli consisting of 2 spatially adjacent bars, each flashed for 20 msec

with onset asynchronies of 0-120 msec. Extracellular single unit activity was recorded from optic tract, lateral geniculate, and visual cortex. After a receptive field was plotted, the stimuli were presented symmetrically about the field center and in several eccentric locations. In the optic tract and lateral geniculate, monotonic decreases of cell firing occurred as the stimuli became closer in time. In the cortex, cells which showed a late peak of firing 200 msec after stimulus onset showed a reduction of the late peak which followed a U-shaped function, with minimum firing at onset asynchronies of about 60 msec. A simple summation of excitation and inhibition can account for the masking. The data explain several paradoxes in the metacontrast literature. (French, German, & Russian summaries) (38 ref)—*Journal abstract*.

9218. Clark, David L. (Ohio State U) **Effects of chronic 2g centrifugation on equilibrium behavior in the rat.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 509-516.—Exposed mature Sprague-Dawley rats to chronic centrifugation at 2g for 60 days. A rail test was utilized to quantitatively evaluate equilibrium behavior in a static and dynamic situation after return to the earth-standard 1g environment. Exposure to chronic centrifugation significantly altered equilibrium behavior. The 2g Ss showed greater disequilibrium than 1g control Ss under both static and dynamic situations. The 1g between the 2 groups increased under more dynamic test conditions. A mechanism is suggested to account for these differences.—*Journal abstract*.

9219. Dooling, Robert J. & Saunders, James C. (Central Inst for the Deaf, St Louis, MO) **Hearing in the parakeet (*Melopsittacus undulatus*): Absolute thresholds, critical ratios, frequency difference limens, and vocalizations.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 1-20.—In Exps I and II avoidance conditioning and the method of limits were used to measure absolute auditory thresholds, masked thresholds, and critical ratios in 4 parakeets. The same procedure was then used in Exps III and IV to study frequency difference limens in 6 additional Ss. The power spectrum and "constancy of intonation" of the parakeet call were also measured and related to the absolute and differential frequency sensitivity. The mechanism of frequency analysis in the parakeet ear is considered in relation to the present results and to the anatomical and functional differences between the avian and mammalian auditory systems. (71 ref)—*Journal abstract*.

9220. Eales, Anthony J. (U Liverpool, Pt Erin, Isle of Man, England) **Sex pheromone in the shore crab *Carcinus maenas*, and the site of its release from females.** *Marine Behaviour & Physiology*, 1974(Aug), Vol 2(4), 345-355.—Demonstrated sex pheromones in pre-molt and recently molted female *Carcinus maenas* and *Macropipus holsatus* (Crustacea Decapoda, Portunidae) under laboratory conditions. Male conspecifics responded with searching activity. Dilute solutions of urine, aspirated from the antennal glands of females of each species, released characteristic responses in conspecific males, but males of other species responded differently if at all. Aspects of responses of test animals in bioassays are discussed. (32 ref)—*Journal abstract*.

9221. Ebel, A. et al. (CNRS, Ctr de Neurochimie, Strasbourg, France) **Activity of cholinergic system enzymes in the cochlea of audiogenic seizure susceptible mice.** *Experientia*, 1974, Vol 30(1), 48-49.—Examined inborn neurochemical differences between mice strains sensitive and insensitive to auditory stimulus. Implications for the study of audiogenic epileptic seizures are noted. (French summary) (17 ref)

9222. Fischer, Gloria J.; Morris, Grant L. & Ruhsam, John P. (Washington State U) **Color picking preferences in white leghorn chickens.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 402-406.—Previous studies of color pecking preferences in newly hatched chicks (*Gallus domesticus*) have shown unimodal preference in the orange region of the spectrum or bimodal preferences at blue and orange. In the present Exp I, 138 dark-hatched White Leghorn chicks were tested in darkness with targets illuminated at 1 or 3 radiant intensity levels. Results show the least amount of pecking at green (541 nm) and peak preferences in blue-violet and orange-red regions. Findings were similar in Exp II when 150 other dark-hatched Ss were tested in the light. Overall, findings suggest unlearned pecking preferences for short and long wavelengths, with minimums at green. Possible evolutionary and photochemical bases for such a bimodal wavelength preference function are discussed. Since bimodality was unaffected by target intensity and background, these variables probably do not account for the unimodal function reported by others.—*Journal abstract*.

9223. Freed, Earl X. (VA Hosp, Lyons, NJ) **Home cage fluid selection by rats following polydipsic fluid choice.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 20-22.—Investigated the hypothesis that caloric need is a variable in animal models of alcoholism. 8 rats were given varying choice combinations of water, ethanol, and 1,3-butenediol with and without food deprivation both in a Skinner box and the home cage. Results show that alcohol ingestion was based upon caloric deprivation.

9224. Govardovskii, V. I. & Zueva, L. V. (Inst of Evolutionary Physiology & Biochemistry, Lab of Evolutionary Morphology, Leningrad, USSR) **Spectral sensitivity of the frog eye in the ultraviolet and visible region.** *Vision Research*, 1974(Dec), Vol 14(12), 1317-1321.—Spectral sensitivity curve of isolated frog retina showed 3 peaks corresponding to  $\alpha$ -,  $\beta$ -, and protein absorption bands of the rhodopsin. Ocular media of *Rana temporaria* were transparent down to 330 nm so that the whole eye showed an appreciable sensitivity in the near ultraviolet. This fact may be of some ecological importance. (French, German, & Russian summaries) (24 ref)

9225. Hendry, L. B. et al. (Pennsylvania State U) **Cis-10-tetradecenyl acetate, an attractant component in the sex pheromone of the oak leaf roller moth (*Archips semiferanus* Walker).** *Experientia*, 1974, Vol 30(8), 886-888.

9226. Horton, Brian J.; Turley, Stephen D. & West, Clive E. (Australian National U, John Curtin School of Medical Research, Canberra City, ACT) **Diurnal variation in the feeding pattern of rabbits.** *Life Sciences*, 1974(Dec), Vol 15(11), 1895-1907.—Conducted 3 experi-

ments with a total of 32 female laboratory-bred rabbits maintained under controlled lighting and fed ad lib. Ss exhibited a weak but consistent diurnal fluctuation in feed intake. There were 2 major periods of eating—at the beginning and at the end of the light period—resulting in similar feed consumption for the light and dark periods. Water intake showed a similar diurnal variation. When the normal lighting cycle was retarded by 6 hrs, Ss adjusted their diurnal rhythm of feeding behavior to the new cycle within 8–15 days. Results of comparative studies with 20 male Wistar albino rats are included. (27 ref)—*Journal abstract*.

9227. Hume, Ann L. (U Auckland, New Zealand) **Optimal response biases and the slope of ROC curves as a function of signal intensity, signal probability, and relative payoff.** *Perception & Psychophysics*, 1974(Oct), Vol 16(2), 377–384.—5 male albino rats performed in a 2-lever analog of the yes-no psychophysical procedure. The signal consisted of an increment in the intensity of a random noise. Correct responses were reinforced with single bursts of brain stimulation; incorrect responses produced brief periods of time-out. Receiver-operating-characteristic (ROC) curves were generated at each of several signal intensities by varying either the signal probability or the relative number of brain stimulations for correct responses. The index of sensitivity increased with the signal intensity and was independent of response bias. When the signal probability was varied, the Ss optimized the number of correct trials and hence the number of brain stimulations obtained at each level of detection. They approximated this optimum more closely as the signal intensity was reduced. When the ratio of brain stimulations was varied, the Ss compromised between optimizing the number of correct trials and optimizing the number of brain stimulations obtained. The slopes of the ROC curves plotted on normal-normal coordinates frequently departed from unity, but did not change systematically with either the signal intensity or the method by which they were generated. (24 ref)—*Journal abstract*.

9228. Humphrey, N. K. (U Cambridge, England) **Species and individuals in the perceptual world of monkeys.** *Perception*, 1974, Vol 3(1), 105–114.—When a monkey is given the choice of looking at a novel picture or a blank white screen he shows an initial preference for the picture which usually abates within about 200 sec; if the picture is then changed for another his preference revives. The level of preference for the 2nd picture depends on the degree to which it is perceived as similar to or different from the 1st. 2 experiments investigated how rhesus monkeys classify pictures of animals and the extent to which they differentiate between individual animals of the same species. 2 classes of animal pictures were used: pictures of other rhesus monkeys and pictures of domestic animals. Results indicate that the 4 inexperienced males, to whom the domestic animals were unfamiliar, treated individual domestic animals of the same species as being closely similar; they treated individual monkeys, on the other hand, as being quite different from each other. The 2 experienced Ss, who were exposed over the course of 6 mo to many further pictures of animals, came to treat all individuals as different from each other.—*Journal abstract*.

9229. Kalinina, A. V. (Lobachevsky State U, Research Inst for Applied Mathematics & Cybernetics, Gorky, USSR) **Classification of frog retina neurons by their quantitative characteristics.** *Vision Research*, 1974(Dec), Vol 14(12), 1305–1316.—On the basis of morphometric analysis, lake frog retina neurons were classified into 5 types that differ from each other by dimensions of perikaryon, dimensions and shape of dendrite field, and character of dendrite ramification. The proposed classification is compared with other concepts on neuron structures of frog retina ganglionic layer. (French, German, & Russian summaries) (43 ref)

9230. Kayes, R. J. (U Cambridge, England) **The daily activity pattern of *Octopus vulgaris* in a natural habitat.** *Marine Behaviour & Physiology*, 1974(Aug), Vol 2(4), 337–343.—Hourly inspection of the octopus by day and night was maintained for 11 days, showing that *O. vulgaris* in this habitat generally hunted throughout the night, with only short excursions from the hole by day.

9231. Maiorana, Valerie A. & Schleidt, Wolfgang M. (U Maryland) **The auditory sensitivity of the turkey.** *Journal of Auditory Research*, 1972(Jul), Vol 12(3), 203–207.—Utilized a modification of the conditioned suppression technique to assess auditory sensitivity of the domestic turkey, *Meleagris gallopavo domesticus*. 2 female turkeys were trained to keypeck for food reinforcement. Electric shock to the axillae was used to produce suppression of pecking during tonal stimuli. Auditory sensitivity was tested at .5, 1, 2, 4, and 8 kHz. Sensitivity was greatest at 1 and 2 kHz. Sensitivity functions were consistent with gobbling responses elicited by pure tones as reported by M. and M. W. Schleidt in 1958.—*M. B. Meikle*.

9232. Mansfield, R. J. (Harvard U) **Neural basis of orientation perception in primate vision.** *Science*, 1974(Dec), Vol 186(4169), 1133–1135.—Notes that orientational differences in human visual acuity can be related parametrically to the distribution of optimal orientations for the receptive fields of neurons in the striate cortex of the rhesus monkey. In the present study neurons were examined in 5 implanted Ss, using single unit extracellular recording techniques to measure the distribution of receptive field orientation sensitivity. Both behavioral measures of acuity and the distribution of receptive fields exhibited maximums for stimuli horizontal or vertical relative to the retina; the effect diminished with distance from the fovea. The anisotropy in the neuronal population and in visual acuity appeared to be determined by postnatal visual experience. (33 ref)—*Journal abstract*.

9233. Martin, Graham R. & Gordon, Ian E. (U Exeter, England) **Visual acuity in the twany owl (*Strix aluco*).** *Vision Research*, 1974(Dec), Vol 14(12), 1393–1397.—Determined threshold visual acuity for grating stimuli in 2 tawny owls (a totally nocturnal avian species). Extensive training was given in a runway apparatus in which stimuli were presented well beyond the near point at a distance of 95 cm. Stimuli were presented according to a modified method of constant stimuli. At a stimulus luminance of 1.7 log mL, acuity thresholds for the 2 Ss equalled 2.7' and 3.7'. Acuity was also determined in 1 S at stimulus luminance at 2 and 1.2 log mL, and equalled 3.4' and 2.5' at each luminance, respectively. These

thresholds are compared with those of 2 humans tested in the same apparatus and with previously published acuity data for other avian and nocturnal species. (French, German, & Russian summaries) (24 ref)—*Journal abstract*.

9234. Phelps, Robert W. (U Rochester) **Effects of interactions of two moving lines on single unit responses in the cat's visual cortex.** *Vision Research*, 1974(Dec), Vol 14(12), 1371-1375.—Recorded the responses of single units with extracellular microelectrodes from the visual cortex of cats. Response histograms were collected to stimuli which consisted of 2 narrow parallel lines of different separations moving through each neuron's receptive field. The majority of units showed a clear decrease in both peak and total response when the separation of the stimulating lines averaged about  $.5^\circ$ . Some units showed an enhancement of their response at separations greater than or less than this. This enhancement could only sometimes be correlated with a "bimodal" excitatory response to a single line. (French, German, & Russian summaries)—*Journal abstract*.

9235. Pilleri, G. (U Berne, Brain Anatomy Inst, Switzerland) **Side-swimming, vision and sense of touch in *Platanista indi* (Cetacea, Platanistidae).** *Experientia*, 1974, Vol 30(1), 100-104.—Studied the vision, touch, side-swimming and acoustic orientation of the *P. indi* dolphin. 4 captive dolphins (3 female, 1 male), originally captured in the lower Indus River, were observed in 2 laboratory tanks equipped with portholes and hydrophones linked to an oscilloscope. The experiments confirmed the *P. indi*'s microphthalmic, lensless eye's ability to only determine a light's direction and to distinguish between light and dark. The *P. indi* emits supersonic (160 kHz) and low frequency sounds, whose echoes are received by the organ of hearing. The experiments showed this sonar apparatus to distinguish between different types of fish of the same size. Side-swimming is attributed to the sense of touch developed in the dolphin's fins, and a phylogenetic explanation of side-swimming is presented. (German summary)—*R. Tomasko*.

9236. Wallman, Joshua. (Rutgers State U, Inst of Animal Behavior, Newark) **A simple technique using an optomotor response for visual psychophysical measurements in animals.** *Vision Research*, 1975(Jan), Vol 15(1), 3-8.—Describes a method for rapidly determining certain visual parameters in animals. It uses the optokinetic or optomotor responses and involves having the stimulus of interest travel in one direction around the animal while a standard grating of adjustable contrast travels in the other direction. The amount of contrast of the standard grating necessary to match the stimulus of interest is compared under different stimulus conditions. Although devised primarily to study color vision, the method can be applied to modulation transfer function and spectral sensitivity, and readily lends itself to screening large numbers of animals. (French, German, & Russian summaries)—*Journal abstract*.

## DEVELOPMENTAL PSYCHOLOGY

9237. Aaron, P. G. & Malatesha, R. N. (Indiana State U) **Discrimination of mirror image stimuli in children.** *Neuropsychologia*, (Oct), Vol 12(4), 549-551.—Studied mirror-image discrimination under 4 conditions with 94 5.9-9.11 yr old males. Results show that Ss recognized and discriminated certain letters and geometrical shapes more readily under a brief tachistoscopic exposure of 80 msec than under a longer exposure of 3.5 sec. This paradoxical finding seems to provide 1 explanation for mirror-image confusions and letter reversals in children. (French & German summaries)—*Journal abstract*.

9238. Brassell, William R. & Kaye, Herbert. (Western Carolina Ctr. Infants' Program, Morganton, NC) **Reinforcement from the sucking environment and subsequent modification of sucking behavior in the human neonate.** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 448-463.—Studied the reinforcing aspects of sucking behavior in 36 human newborns in a limited instrumental conditioning paradigm where sucking was both operant and a reinforcer. During training, response density (rate based on sucking opportunity time) and latency were measures of 2 components of nonnutritive sucking, contingent negative pressure suction, and incidental jaw movement. The strategy for determining the reinforcing aspect of sucking involved comparisons of 3 types of sucking stimuli as reinforcers. The nature of modified operant sucking was investigated during extinction by examining number of sucks/burst, number of bursts emitted, and interburst interval time. The feedback from sucking which acted as reinforcement was concluded to be response density. Sucking was modified by changes in pausing behavior, including response latency and pauses between bursts of sucks. The number of sucks/burst also showed a significant change under certain conditioning arrangements.—*Journal abstract*.

9239. Bryant, Gillian M. & Davies, Kathleen J. (South Glamorgan Area Health Authority, Cardiff, Wales) **The effect of sex, social class, and parity on achievement of Denver Developmental Screening Test items in the first year of life.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 485-493.—In standardizing the Denver Developmental Screening Test on 668 Cardiff infants in their 1st yr, (see PA, Vol 53:Issue 5), no conclusive differences in the effects of sex, social class, and position in family were seen. The data suggest that differences are either random, or become more definite in subsequent years. (French, German, & Spanish summaries)

9240. Bryant, Gillian M.; Davies, Kathleen J. & Newcombe, Robert G. (South Glamorgan Area Health Authority, Cardiff, Wales) **The Denver Developmental Screening Test: Achievement of test items in the first year of life by Denver and Cardiff infants.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 475-484.—Attempted to standardize the Denver Developmental Screening Test on 668 infants in Cardiff. These Ss appeared slightly more advanced than Denver infants on language and personal-social items of the 1st yr, and somewhat slower on motor items. (German, French & Spanish summaries)

9241. Buss, Allan R. (U Alberta, Ctr for Advanced Study in Theoretical Psychology, Edmonton, Canada) **Generational analysis: Description, explanation, and theory.** *Journal of Social Issues*, 1974, Vol 30(2), 55-71.

—Notes that an adequate strategy in generational analysis must concern itself with at least 3 general matters: obtaining adequate descriptive data, explaining such data, and relating explanation to a general theory of generational differences and social change. At the descriptive level, generational differences at a given point in time may be associated with age, cohort, and/or interactional effects. The explanation of age, cohort, and interactional effects necessitates introducing additional variables and considerations into the basic descriptive model. Finally, for research on generational differences and social change to be most useful, empirical studies should be couched within a theoretical perspective. (42 ref)—*Journal abstract*.

9242. Gruber, Howard E. & Barrett, Paul H. (Rutgers State U, Inst for Cognitive Studies) **Darwin on man: A psychological study of scientific creativity.** New York, NY: E. P. Dutton, 1974. xxv, 495 p. \$20.—Presents an historical and biographical study of the development of Darwin's thought and a general discussion of the creative process from the standpoint of developmental psychology. The history of the suppression of scientific thought, Darwin's theories on religion, and the problem of philosophic materialism are also examined.

9243. Harris, P. L.; Cassel, T. Z. & Bamborough, P. (U Lancaster, England) **Tracking by young infants.** *British Journal of Psychology*, 1974(Aug), Vol 65(3), 345-349.—Conducted 2 experiments with a total of 44 8-28 wk old infants to determine the degree to which tracking activities are supported by the displacement of an object relative to a background in contrast to displacement of the whole field. Results support this hypothesis. When object and background moved together tracking was disrupted. This disruption is showed to be due to the absence of relative displacement between object and background and not to movement of the background as such. It is suggested that the absence of relative displacement reduces the duration of pursuit but does not alter the frequency of target-capture.—*Journal abstract*.

9244. Hurlock, Elizabeth B. **Developmental psychology.** (4th ed). New York, NY: McGraw-Hill, 1975. xiv, 395 p. \$11.95.—This is the revised 4th edition of a textbook on theories and research in developmental psychology. Topics include infancy; personal and social adjustment in early and late childhood, adolescence, and adulthood; and vocational and family adjustment in middle and old age.

9245. Kostrzewski, Janusz. (State Inst of Professional Pedagogy, Warsaw, Poland) **[The mental, social and motor development of children from day nurseries and family homes.]** (Polh) *Przegląd Psychologiczny*, 1973, Vol 16(1), 3-18.—Compared 14 girls and 18 boys who had spent 1-12 mo (mean 5 mo) in a day care center (described in some detail) with 13 girls and 19 boys living at home. Mean age of the Ss was 13 mo, and the groups were approximately matched for education of parents. All were tested in the presence of their mothers on modifications of the Cattell Infant Intelligence Scale, the

Vineland Social Maturity Scale, and the Test of Motor Proficiency for Children from 1-5 yrs old. No significant difference was found on any of the tests, but the children from homes showed a greater emotional stability and were easier to establish contact with. (Russian & English summaries) (28 ref)—*I. Divac*.

9246. Lemond, L. Charles & Nunnally, Jum C. (Vanderbilt U) **The influence of incongruity and preexposure on the familiarity effect in visual selection of children.** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 373-381.—A consistent finding in the literature concerning visual selection is that Ss will spend more time viewing unfamiliar stimuli than stimuli with which they have been familiarized. In the present experiment, the relationship between the magnitude of this familiarity effect and the level of stimulus incongruity was examined with 30 4th graders and found to be monotonic and increasing. Amount of stimulus preexposure had no significant effect on the magnitude of the familiarity effect. There was no overall difference in Ss' preference for familiar and unfamiliar stimuli. Results support a theory of visual selection based on information-conflict resolution. (20 ref)—*Journal abstract*.

9247. McGurk, Harry & Jahoda, Gustav. (U Surrey, Guildford, England) **The development of pictorial depth perception: The role of figural elevation.** *British Journal of Psychology*, 1974(Aug), Vol 65(3), 367-376.—Conducted 2 follow-up experiments of a previous study by G. Jahoda and H. McGurk (see PA, Vol 52:9818), in which pictorial depth cues were systematically manipulated. In Exp 1 144 4-10½ yr old children were presented with stimulus pictures in which depth cues were reduced to elevation and walking or standing posture of 2 figures. In 1 condition a training picture reminding Ss of the actual size relations remained visible, in order to test for possible memory effects, and in the other condition it was absent. Ss were required to construct 3-dimensional models representing the size and spatial relationships between figures in the pictures, scoring being in terms of size and spatial accuracy. Results are consistent with previous ones, indicating that elevation alone constitutes a relatively weak but effective depth cue. There was a moderate memory effect, posture being insignificant. Exp 2 tested the hypothesis that the difficulties experienced by younger Ss are response rather than perceptually based. The 72 4-6 yr old Ss from Exp 1 were given the task of reproducing a 3-dimensional model. Ss had no difficulty with size, but spatial responses were at a very low level at the age of 4, increasing significantly in accuracy by the age of 6. The predominant error at both age levels was horizontal instead of diagonal orientation. This is in conformity with the hypothesis and consistent with previous results.—*Journal abstract*.

9248. Nikolskaya, A. A. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[A review of literature in child and pedagogical psychology in pre-revolutionary Russia from the beginning of XX century to the October revolution.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 156-157.

**Effects of successive pretraining of components in a dimension-abstracted oddity task.** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 398-411.

—Investigated the effects of training 2 components of a dimension-abstracted oddity problem, oddity responding and attention. All Ss (96 2nd graders) were given a series of 3 problems. Type of oddity training was manipulated on Problem 1, and Ss learned (a) an oddity response in a problem whose format was the same as the final transfer problem, (b) an oddity response in a problem whose format was different from the final problem, or (c) no oddity response. Attention training was manipulated on Problem 2. Results show that (a) Ss given same format oddity training and appropriate attention training were able to integrate that information on the final problem, (b) the probability of transferring the oddity response learned on Problem 1 to Problem 3 depended upon the similarity of the task formats, and (c) the 2 trained components tended to combine in an interactive fashion. —*Journal abstract.*

9257. Carrow, Elizabeth. (U Texas, Austin) **A test using elicited imitations in assessing grammatical structure in children.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 437-444.—Used elicited imitation to obtain performance data on the grammatical system of 475 3-7 yr olds. The procedure attempted to provide an instrument which would be valid and reliable while at the same time easy to administer and score without extensive training or knowledge of linguistics. Grammatical categories included were articles, adjectives, nouns, pronouns, demonstratives, conjunctions, verbs, negatives, contractions, prepositions, and adverbs. Results demonstrate reliability and validity as well as test usefulness in specific analysis of grammatical constructions. (15 ref)—*Journal abstract.*

9258. Case, Robbie. (U California, School of Education, Berkeley) **Mental strategies, mental capacity, and instruction: A neo-Piagetian investigation.** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 382-397.—Conducted 2 experiments which used J. Pascual-Leone's neo-Piagetian theory of development to predict the pre- and postinstruction distributions of scores on an S-controlled digit placement task as a function of 3 parameters: (a) the mental strategy which Ss attempted to apply, (b) the demand which attempting to apply this strategy placed on their mental capacity, and (c) the maximum mental capacity which they were capable of mobilizing. Ss were a total of 180 6-10 yr old children. The predicted and obtained distributions corresponded quite closely for each kind of strategy at each age level sampled (6, 8, and 10 yrs). Methodological and analytic requirements which must be met if the same approach is to be applied to making successful predictions in more naturalistic paradigms are discussed. —*Journal abstract.*

9259. de Villiers, Peter A. & de Villiers, Jill G. (Harvard U) **On this, that, and the other: Nonegocentrism in very young children.** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 438-447.—Studied the development of comprehension and production of spatial deictic terms "this-that," "here-there," "my-your," and "in front of-behind" in the context of a hide-and-seek game. The 1st 3 contrasts are produced

according to the speaker's perspective, so comprehension requires a nonegocentric viewpoint. The contrast "in front of-behind" is produced relative to the hearer (i.e., production is nonegocentric). Ss were 39 children, ranging in age from 2.5-4.5 yrs, and 18 undergraduates. The 2.5-yr-old children were best at those contrasts which do not require a shift in perspective. The 3- and 4-yr-old children were adept at switching to the speaker's perspective for comprehension of the terms requiring this shift (i.e., were nonegocentric). 4-yr-olds were also capable of nonegocentric production of "in front of-behind." —*Journal abstract.*

9260. Elser, Christine. (U Bristol, England) **Recognition and inference in the co-ordination of perspectives.** *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 309-312.—Conducted a study of 30 6-8 yr olds to compare (a) a recognition procedure, in which the S views a model from different perspectives prior to selecting the viewpoint required; and (b) an inference procedure, in which the S makes his choice after viewing a model from 1 position only. Ss demonstrated less egocentrism in the recognition than in the inference condition. It is suggested that this distinction can help explain some apparent anomalies in the results of earlier research. —*Journal abstract.*

9261. Evans, Joyce S. (Southwest Educational Development Lab, Early Childhood Div, Austin, TX) **Word-pair discrimination and imitation abilities of preschool Spanish-speaking children.** *Journal of Learning Disabilities*, 1974(Nov), Vol 7(9), 573-580.—Investigated auditory abilities, measured by word-pair discrimination and single word imitation, of 20 economically disadvantaged native-Spanish-speaking preschool children aged 4 yrs and over in 2 languages, Spanish and English. In order to provide age-related comparative information, 20 nondisadvantaged native-English-speaking preschoolers were evaluated on the same tasks. In spite of the dual problems of economic disadvantage and 2nd-language learning, the Spanish-speaking children were not significantly different from their advantaged English-speaking peers in total performance on the 4 tasks. In addition, Spanish speakers made fewer errors in their native language than did the English speakers. Thus, previously hypothesized negative effects of poverty or of linguistic interference do not appear to be depressing auditory performance. A descriptive analysis of errors indicates directions for educational programs in the area of auditory training for preschool bilingual programs. (16 ref)—*Journal abstract.*

9262. Friedrich, Douglas. (Central Michigan U) **Slow learner, average, and gifted third graders: Strategy analysis and training for learning.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 344-350.—Measured the performance of 48 gifted, average, and slow-learning 3rd graders on a visual-term memory task which involved free recall of objects presented sequentially by a Kodak Carousel. The objects were grouped into conceptual sets, with 4 objects per set. Ss performed better on concrete than on abstract short-term memory concept tasks. —H. Kaczowski.

9263. Haaf, Robert A. (U Toledo) **Complexity and facial resemblance as determinants of response to facelike stimuli by 5- and 10-week-old infants.** *Journal*

of *Experimental Child Psychology*, 1974(Dec), Vol 18(3), 480-487.—Determined whether infants at 5 and 10 wks of age respond to facelike drawings on the basis of stimulus complexity or on the basis of degree of resemblance to the human face. 24 Ss at each age were shown 4 patterns in which these 2 dimensions were varied orthogonally. Fixation time was recorded using the successive, single stimulus procedure. Results provide no evidence of response to the facial resemblance dimension at either age level. However, there was a significant complexity component in the responses of both groups. The 5-wk-old infants preferred an intermediate level of stimulus complexity. Those at 10 wks showed a linear preference for increasing levels of the complexity dimension.—*Journal abstract*.

9264. Harris, P. L. (U Lancaster, England) **Perseverative search at a visibly empty place by young infants.** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 535-542.—Results of 2 experiments with 40 infants (mean age range = 307-383 days) indicate that when an object moved to a new place, Ss approached both its new location and its prior location. These object locations were not treated as mutually exclusive by the Ss even when the object was visible at the new location and visibly absent from the old location. It is concluded that perseverative error cannot therefore simply be a memory problem.—*Journal abstract*.

9265. Heron, Alastair & Dowel, Wendy. (U Melbourne, Vic, Australia) **The questionable unity of the concrete operations stage.** *International Journal of Psychology*, 1974, Vol 9(1), 1-9.—49 Yugoslav immigrants 9-13 yrs old who had been in Australia 3-24 mo, had had 1-4 yrs of schooling in Yugoslavia, and were enrolled in Grades 4 and 5 in Melbourne schools, took individually administered tests in the Serbo-Croat language, including conservation measures (number, quantity, weight, and volume), seriation measures, class inclusion measures, and multiple classification tests. While these Ss were approximately 2 yrs behind Geneva children on several aspects of concrete operational performance, exploration of the relationship between performance on the multiple classification tasks and performance on other concrete operational tasks revealed that at least 1/3 of the nonconservers could deal successfully with 7 out of 8 operational multiple classification tasks. Results lead to the conclusion that there is no essential causal connection between operational performance on conservation tasks and on multiple classification tasks. The concrete operations stage, judging from these data, does not seem to be a formal unity. It may be viewed more productively as a set of structures without necessary interdependence. (20 ref)—E. A. Gavin.

9266. Inhelder, Bärbel; Sinclair, Hermine & Bovet, Magali. (U Geneva, Ecole de Psychologie, Switzerland) **Learning and the development of cognition.** (Trans S. Wedgwood). Cambridge, MA: Harvard University Press, 1974. xiv, 308 p. \$15.—Presents findings on language and cognitive development in children based on the authors' 10 yrs of research on Piagetian concepts. Topics include concepts of conservation of continuous quantities, from numerical equality to the conservation of matter, a cross-cultural study of conservation concepts, and class

inclusion training and its influence on conservation. (5% p ref)

9267. Kail, Robert V. & Schroll, John T. (U Michigan) **Evaluative and taxonomic encoding in children's memory.** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 426-437.—Conducted 2 experiments with a total of 168 2nd, 3rd, 5th, and 6th graders to investigate the development of evaluative and taxonomic encoding in children's memory. The task used was a modification of D. D. Wickens's short-term memory task in which Ss' recall of words is tested following a distraction task. Exp I found that 11-yr-old children, but not 8-yr-old children, encoded words using the evaluative dimension of the semantic differential. In Exp II, both 7- and 11-yr-olds demonstrated the ability to encode words according to taxonomic categories. (19 ref)—*Journal abstract*.

9268. Kail, Robert V. (U Michigan) **Familiarity and attraction to stimuli: Developmental change or methodological artifact?** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 504-511.—113 7-, 9-, and 11-yr-old children viewed a series of stimuli consisting of Chinese characters exposed a different number of times. Following exposure to the stimuli, Ss ranked the stimuli according to liking. 7 and 9 yr olds preferred the more familiar characters to those seen less frequently, but the oldest children preferred novel stimuli. In rankings taken 3 wks after original exposure a subsample of 11 yr olds preferred the more familiar characters. Results suggest that discrepancies obtained in previous research on the affective consequences of mere exposure are of methodological rather than developmental origin. Possible critical differences in procedure are discussed. (15 ref)—*Journal abstract*.

9269. Kendler, Howard H. & Helland, Joan. (U California, Santa Barbara) **Ontogenetic changes in classification behavior.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 456-458.—Conducted a developmental study of free-classification behavior within the age range of 3.5-19 yrs, using 192 Ss. Results indicate that categorical responses, which are characteristic of adult human behavior, increased with age; overgeneralized responses—classifications including noncategorical instances—decreased with age. Overdiscriminated responses which are incomplete categorical classifications increased from ages 3.5 to 6 yrs and then decreased to 19 yrs of age. These results are discussed within a 2-stage theory of conceptual development by H. Kendler (1971).—*Journal abstract*.

9270. Kopp, Claire B. (U California, Los Angeles) **Fine motor abilities of infants.** *Developmental Medicine & Child Neurology*, 1974(Oct), Vol 16(5), 629-636.—Classified 26 full-term and 10 preterm infants 8 mo old as either coordinated or clumsy in fine motor movements. Coordinated babies did significantly more manipulative and oral object-exploring than the clumsy ones, each group showing a distinct style of object interaction. (French, German, & Spanish summaries) (22 ref)—P. W. Pruyser.

9271. L'vov, M. R. (Magnitogorsk Pedagogical Inst, USSR) **[The nature of the written language of high school students.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 150-154.—Performed a quantitative study of the sentence structure of 67,580 sentences

collected from essays written by students in Grades 3-10 over a period of 7 yrs. Statistical regularities in the development of the use of written language are noted.

9272. Lesser, Harvey. (Rutgers State U, Camden) **Children's unusual responses to observed movement.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 201-206.—Investigated V. Olum's finding that 7-yr-old children, in contrast to adults, give unusual responses to observed movement. The following procedural changes were made: (a) stimuli was presented without repetition, (b) neutral instructions were used, (c) different and more complicated stimuli were used, and (d) 20 7-yr-old and 20 10-yr-old Ss were used. Results show the same unusual responses. They cannot be explained as an effect of repetition, particular stimuli, or procedure. The younger Ss' responses were less accurate and more variable. The finding supports Piaget's perceptual theory as it relates to stages of cognitive development.—*Journal abstract*.

9273. MacDonald, Randolph; Hines, Brainard & Kenoyer, Charles. (West Virginia Dept of Mental Health, Children's Mental Health Services, Charleston) **Socioeconomic status as related to two levels of conceptual attainment.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 195-199.—Conducted a study of approximately 225 3-5 yr old children to test 4 of A. R. Jensen's (1969) hypotheses relating socioeconomic level and certain types of concept learning. Ss were administered 5 subtests, identified as corresponding to Jensen's 2 levels of cognitive functioning, of the Illinois Test of Psycholinguistic Abilities. Results show that tasks reflecting both Level I and Level II abilities were performed with more accuracy by preschool children identified in the upper socioeconomic status (SES) level; this performance remained the same even after the variable of IQ was controlled for by covariance for the SES levels. It is suggested that the results may reflect a general state of cognitive deprivation for children in the lower SES level as opposed to a specific Level II deficit. However, the performance on Subtest 2 (visual reception) was not significantly different for the 2 socioeconomic groups involved. Thus, the Level I-Level II dichotomy has not been substantiated, and the corollary hypotheses have equivocal substantiation.—*Journal abstract*.

9274. Morrison, Frederick J.; Holmes, Deborah L. & Halth, Marshall M. (Dartmouth Coll) **A developmental study of the effect of familiarity on short-term visual memory.** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 412-425.—Investigated whether previously reported limitations on young children's full-report capacity lay in a smaller amount of available information, in a shorter trace duration of information in visual information storage (VIS), or in poorer coding of information into permanent storage. 5 and 8 yr olds and undergraduates ( $N = 36$ ) were shown an 8-item array of figures, followed at varying intervals by an indicator signaling the S to report the figure to which the indicator had pointed. 3 levels of familiarity were used. While no age differences were revealed in amount of information available or in the trace duration of information in VIS, strong age differences emerged in coding of information into permanent storage. The differences seemed to lie in the use of organized visual coding and rehearsal

strategies by adults and their relative lack of use by children. (17 ref)—*Journal abstract*.

9275. Mulford, W. R. & Young, R. E. **Cognitive development studies in Papua New Guinea.** *New Guinea Psychologist*, 1973, Mono Suppl No 5, 23 p.—A review of the literature on cognitive development in Papua New Guinea reveals that most studies do not find the people engaging in abstract thinking. Anthropological observations of social and moral behavior reinforce this impression of concrete thinking. Attitude and value studies have found an emphasis on pragmatism and a punishment-obedience orientation. Possible explanations for these findings include the fact that most studies were conducted by foreign, white social scientists. The preferred explanation is that problem-solving skills with long histories in other cultures are new in Papua New Guinea, whose people are therefore at an earlier stage of cognitive development. (36 ref)—*C. Wright*.

9276. Nelson, Lois N. (San Francisco State U) **The development of cognitive operations in young children.** *Journal of Educational Research*, 1974(Nov), Vol 68(3), 116-123.—Investigated the age when certain cognitive operations involved in conservation of number, mass, and continuous quantity develop in young children. 257 5.4-7.7 yr old kindergartners and 1st graders were exposed to 3 conservation tasks, 84% of the 5-yr-old group and 94% of the 6-yr-old group understood equivalency and reversibility involved in conservation of number. It appears that conservation of number is developed at an earlier age than the normative data suggests. Performance on conservation of mass and continuous quantity tasks indicated that most Ss were not able to conserve mass and quantity before the age of 7 yrs. No significant sex difference was found in the performance of males and females on any of the 3 tasks at any age level.—*Journal abstract*.

9277. Okonji, M. O. (U Lagos, Nigeria) **The development of logical thinking in preschool Zambian children: Classification.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 247-255.—Conducted a study of a total of 128 3-6 yr old children from high and low socioeconomic backgrounds to determine the extent to which Ss displayed the pattern of the early classificatory behavior described by B. Inhelder and Piaget (1967). Ss were given a classificatory task comprising pieces of wooden geometric shapes which also varied in color and size. Sorting was done under 2 conditions—free sorting and guided sorting. Results show that these Ss were not yet able to form true classes as expected in light of Piaget's theory. It was observed, however, that "graphic collections" were not a dominant feature of Ss' classificatory performance. The usefulness of designating a substage of the growth of logic as the stage of graphic collections is questioned especially if it is intended to be a universal descriptive category. The need for longitudinal studies or cross-sectional studies covering from age 2 to beyond 11 yrs is stressed to streamline and strengthen the evidence from Africa suggesting that in overall pattern it is not different from the pattern observed elsewhere by Piaget and others.—*Journal abstract*.

9278. Philip, Hugh & Kelly, M. (Macquarie U, School of Education, North Ryde, NSW, Australia) **Product and process in cognitive development: Some compara-**

tive data on the performance of school age children in different cultures. *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 248-265.—Administered tasks derived from the theoretical positions of Piaget (1955) and J. Bruner (1966) to a total of 1,536 children, aged 5-15 yrs, in 3 cultures—New South Wales, Australia, and 3 different areas in Papua New Guinea. The tasks were divided into 2 groups—product (getting it right) and process (how it was done). Behaviors, representative of development according to the theories of Piaget and Bruner, were found in all 3 cultures. The order of difficulty of the Piagetian product tasks, with some minor exceptions, was the same for all 3 cultures, whether the children had been to school or not. The Bruner process tasks presented a different picture. There were material differences from culture to culture in the order of appearance of various identifiable processes. As difficulty of task increased, the process commonly used by the children of each culture changed. With the most difficult tasks, the children from all cultures tended to use the same process.—*Journal abstract*.

9279. Piaget, Jean & Inhelder, Bärbel. (U Geneva, Switzerland) *The origin of the idea of chance in children*. (Trans L. Leake et al). New York, NY: W. W. Norton, 1975. xx, 251 p. \$12.50.—Examines the formation of the physical aspects of the notion of chance and the development of combining operations which contribute to determining the relationship between chance, probability, and the mind's operating mechanisms. Theoretical and empirical findings are examined in relation to both random and combinatoric operations and different groups of Ss.

9280. Ploog, Detlev. (Max-Planck-Inst für Psychiatrie, Munich, W Germany) *Similarities and differences of behavior as a function of cerebral evolution and dissolution*. *Social Science Information*, 1974(Jun), Vol 13(3), 83-95.—Analyzes behavior from the viewpoint that there is no dichotomy between humans and other primates. Language and speech are based upon special human biology, with new faculties within past biological framework. Behavior similar to other primates is, however, part of a human response; there is no purely animal residue, nor uniquely human behavior, as totally separated from animal. Vocal communication demands parallel evolution of signal system, motor control, sensory reception, and cortical decoding. 8 different squirrel monkey calls have been elicited by localized cortical stimulation in research cited, and these calls were shown to be identifiably present in neonate monkeys. Deafened adults retained the calls, and fetuses of squirrel monkeys muted during pregnancy had vocal ontology similar to normals. This animal does not need feedback for vocal behavior, and any modifications of this behavior are limited to length and intensity of calls, not variety. Man, however, has cerebral representation into the substrate of the motor cortex and therefore a varied ontology of phonemes and vocal patterns, paralleled by vocal tract evolution. (25 ref)—R. J. Anderson.

9281. Rich, Eugene C.; Marshall, Richard E. & Volpe, Joseph J. (Washington U, Medical School) *The normal neonatal response to pin-prick*. *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 432-434.

—Gave 5 pinpricks in rapid succession, moving proximally along the medial side of the leg from just below to above the knee, to 130 healthy neonates. The response was movement of upper and lower limbs, usually accompanied by grimace and/or cry. (German, French, & Spanish summaries)

9282. Scandura, Joseph M. & McGee, Robert. (U Pennsylvania) *An exploratory investigation of basic mathematical abilities of kindergarten children*. *Journal of Structural Learning*, 1972, Vol 3(3), 79-98.—Studied certain basic mathematical abilities with which kindergarten children enter school, particularly the ability to perform certain types of conservation tasks and the processing skills involved in learning and transmitting mathematical knowledge. 4 types of processing skills were studied in 16 kindergarten children: ability to detect regularities, to describe regularities, to interpret descriptions of regularities, and to make simple deductions. Results suggest that these skills are not possessed by the majority of children entering school, and cannot be assumed in planning instruction.—R. S. Albin.

9283. Smoll, Frank L. (U Washington) *Development of rhythmic ability in response to selected tempos*. *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 767-772.—Studied the development of space-time characteristics of children's motor responses to auditory rhythmic stimuli. 20 Ss were randomly selected from each of 6 groupings representing ages 6-11 yrs. Utilizing a rhythmic analysis system, Ss performed 16 consecutive motor responses in time with auditory rhythmic stimuli presented at intervals of 1.4, 1.1, and .8 sec. Findings indicate a significant reduction of error in spatial and temporal accuracy with increasing age for each tempo. However, the Tempo main effect was not significant, and no level of tempo interacted with any specific level of age. The influence of personal rhythm on responses to externally imposed tempos is discussed.—*Journal abstract*.

9284. Somerville, Susan C. (U Melbourne, Vic, Australia) *The pendulum problem: Patterns of performance defining developmental stages*. *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 266-281.—Performance on B. Inhelder and Piaget's (1958) pendulum problem was obtained as a validating measure in a study of 236 children, aged 10-14 yrs, investigating the transition from concrete to formal thinking. A detailed scoring procedure was devised, which distinguished method from content aspects of performance on the problem and which allowed categorization of each child into 1 of 9 developmental stages; quantitative performance scores were also derived. Overall level of performance on the pendulum problem was strongly related to age, but not to sex or to school attended. In general, the results support Inhelder and Piaget's account of the transition from concrete to formal thinking. However, a specific problem, for their theory, arises from the relationship between method and content aspects of performance in the early formal operational stage. This problem is discussed in detail and attention is drawn to the effects of a child's expectations on his performance.—*Journal abstract*.

9285. Strauss, Sidney & Liberman, Dov. (Tel-Aviv U, School of Education, Israel) *The empirical violation of conservation laws and its relation to structural change*.

*Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 464-479.—In 2 experiments, 105 4-10 yr old concrete operational Ss were provided empirical evidence of nonconservation of discontinuous quantity and weight. Few Ss accepted this evidence. This was interpreted as supporting the organismic-developmental claim that lower forms of reasoning are transformed into structurally more advanced forms. It was also found that (a) probing provided a more accurate assessment of Ss' operational levels, (b) one could empirically distinguish between logicomathematical and physical knowledge, and (c) the former was understood by Ss to be nomically necessary and the latter, in the case of weight, may not be. (26 ref)—*Journal abstract*.

9286. Strzyzewski, Stanislaw. (Coll of Physical Training, Katowice, Poland) [Youth from Bydgoszcz primary schools in the light of J. C. Raven's Progressive Matrices Test.] (Polish) *Przegląd Psychologiczny*, 1973, Vol 16(1), 61-70.—1,436 girls and 1,382 boys, 8.5-15.5 yrs old were given 30 min to solve 5 series of 12 problems each. Results indicate that (a) boys and girls do not differ in reasoning abilities, (b) maximal development of reasoning takes place before 14 yrs of age, and (c) interpersonal distribution of reasoning abilities is normal for the youngest groups and becomes increasingly negatively skewed with age. (Russian & English summaries)

9287. Swanson, Guy E. (U California, Berkeley) **Family structure and the reflective intelligence of children.** *Sociometry*, 1974(Dec), Vol 37(4), 459-490.—Piaget, and more explicitly, G. H. Mead (1934), have suggested that a child's being reared in groups which institutionalize and integrate diverse points of view will foster the use of reflective intelligence. Scores on 2 Piagetian cognitive tasks were obtained from 103 children and adolescents who came from 52 families in the Oakland Growth Study. These scores were then correlated with the patterns of corporate decision making found in these families, and the result suggested by Mead was obtained. This result survived when each of several variables was controlled, including the age and sex of the children, IQ and Piagetian cognitive scores of their parents, the socioeconomic status of the families, and the "warmth" of familial relations. The children's IQ scores were not related to the patterns of decision making in their families, but were related to indices of familial warmth. (3 p ref)—*Journal abstract*.

9288. Timko, Henry G. (U Victoria, Toronto, Ontario, Canada) **Effects of discrimination training mode and letter similarity on paired-associate learning.** *Journal of Educational Research*, 1974(Oct), Vol 68(2), 71-72.—Tested 40 1st graders to determine the effect of presentation mode (simultaneous vs successive) and letter similarity (similar—b, d, q vs distinctive—m, s, c) on visual discrimination learning. An attempt was also made to determine what effect the differential initial learning conditions have on subsequent paired-associate learning. On initial learning, Ss performed significantly better on the simultaneous mode and on distinctive letters ( $p < .01$ ). A significant interaction showed that simultaneous discriminations were easier to learn than successive discriminations with similar letters but not with distinctive letters. The letter similarity dimension

produced the only significant difference on the transfer task ( $p < .05$ ).—*Journal abstract*.

9289. Tyrrell, Donald J. (Franklin & Marshall Coll) **Crossmodal transfer of conceptual responding in children.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-A), 269-271.—Compared the speed with which 48 3rd-grade children acquired the oddity concept in the haptic and visual modalities and assessed the extent to which they transferred that concept to problems presented in the alternate modality. Ss were presented with 2 consecutive 2-choice discrimination problems or 2 double-stimulus oddity problems. Half of the children received these training problems in the visual modality, while the remainder experienced the problems by active touch; all children were then presented with 2 double-stimulus oddity problems in the alternate modality. During original learning, the tactual oddity task was more difficult than both the visual oddity problem and the tactual discrimination problem. All oddity trained groups learned the crossmodal oddity task at a rate superior to the children given discrimination training. It is concluded that crossmodal transfer of the oddity concept did occur. (15 ref)—*Journal abstract*.

9290. Zajonc, R. B. & Markus, Gregory B. (U Michigan, Research Ctr for Group Dynamics) **Birth order and intellectual development.** *Psychological Review*, 1975(Jan), Vol 82(1), 74-88.—Describes a confluence model that explains the effects of birth order and family size on intelligence. Intellectual development within the family context is conceived of as depending on the cumulative effects of the intellectual environment, which consists primarily of the siblings' and parents' intelligence. Mutual influences, through time, on the intellectual development of the siblings are described by the growth parameter  $\alpha$ . The confluence model predicts positive as well as negative effects of birth order, a necessarily negative effect of family size, and a handicap for the last born and the only child. The model explains several features of a large birth order study carried out on nearly 400,000 19 yr olds. Extensions of the confluence model to other social processes are discussed, along with the usefulness of the confluence model in explicating the emergence of individual differences in a social context. (39 ref)—*Journal abstract*.

9291. Zimmerman, Barry J. & Rosenthal, Ted L. (Graduate School & University Ctr, City U New York) **Conceptual generalization and retention by young children: Age, modeling, and feedback effects.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 233-245.—Studied the effects of modeling and corrective feedback on conceptual rule acquisition and retention with 24 3- and 24 4-yr-old children. Results show that (a) brief observation of a model was effective in creating significant acquisition and retention of conceptual rule judgments and explanations, (b) corrective feedback improved the S's ability to explain the conceptual rule but did not assist nonverbal performance, (c) the facilitative influence of corrective feedback was largely confined to the 4-yr-old age group, and (d) 4-yr-old Ss were more successful than 3-yr-olds in learning to provide viable reasons for conceptual judgments. (19 ref)—*Journal abstract*.

## Emotional &amp; Personality Development

9292. Chudnovskii, V. E. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) [The stability of personality as a problem in the psychology of child-rearing.] (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 43-58.—Considers the nature, origin, and dynamics of the moral aspects of personality. Consistency in personality results from the incorporation of moral norms into character. The difference between stability of the physiological bases of individuality and consistency in behavior is stressed. Consistent personal behavior and nonconformity are considered 2 different things; Western conformity and group pressure research is criticized. Features of moral development are described, the importance of personality formation in the course of upbringing is underlined, and the role of future goals and of a time perspective in moral development is discussed. In the discussion of age-related trends in moral development the internalization of group values and the shift of the center of gravity of a value framework toward society and societal groups is stressed as an indispensable aspect of moral development. The methodology of research on the stability of personality is also considered. (English summary) (41 ref)—L. Zusne.

9293. Goggin, James E. (Texas Tech U, Medical School) Dependency, imitation learning, and the process of identification. *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 207-217.—Conducted a study of 73 preschool children (41 males and 32 females) to investigate the relationship between dependency and imitation learning. Instrumental dependency and emotional dependency were measured by a naturalistic behavioral observation technique. Purposive and incidental imitation learning were taught by modeling procedures. The Ss' degree of emotional dependency was related to their propensity to imitate the model's irrelevant behavior (i.e., incidental learning). While the nature of the postulated relationship remained unclear, the results suggest that sex and age were influential factors. (17 ref)—*Journal abstract*.

9294. Herzog, John D. (Northeastern U) Initiation and high school in the development of Kikuyu youths' self-concept. *Ethos*, 1973(Win), Vol 1(4), 478-489.—Studied the effect of initiation rites on the self-images of Kikuyu boys. It was found that initiation alone did not have an immediate impact on Ss' self-concepts, but that initiation combined with secondary education led to the development of mature and sexually appropriate self-images.

9295. McConochie, Daniel; Greenberger, Ellen & Josselson, Ruthellen. (Johns Hopkins U, Ctr for Social Organization of Schools) An exploratory examination of individual, family and school influences on psychosocial maturity. *Center for Social Organization of Schools Report, Johns Hopkins University*, 1974(Nov), No 184, 40 p.—Presents exploratory analyses of the relative effect of various individual, school, and family characteristics on Individual Adequacy and Social Adequacy—2 of the summary variables developed to measure theoretical components of psychosocial maturity. Multivariate analyses were conducted using sex, parental education, racial composition of the school, and fathers' education-

al level of the school as independent variables. The study used samples of 5th, 8th, and 11th grade students in 29 schools. Separate analyses were conducted for black and white students at each grade level. Results indicate that individual, family, and school characteristics have different potency in explaining variations in students' individual and social adequacy, depending on the race, sex, and year in school.—*Journal abstract*.

## Social Behavior &amp; Family Relations

9296. Baider, Lea & Rosenfeld, Eva. (Hebrew U, Paul Baerwald School of Social Work, Jerusalem, Israel) Effect of parental fears on children in wartime. *Social Casework*, 1974(Oct), Vol 55(8), 497-503.—Suggests, on the basis of recent war experiences in Israel, that parental fear reactions are especially traumatic for the small child when the parents try to protect him by denying the facts of war. Illustrations are cited which show that small children react to unexplained and hidden stress in their environment with distress. Children notice and can be helped to comprehend events that affect their lives. When an adult is able to act as mediator and interpreter of stressful events, the child's anxiety lessens and both adult and child find a new source of comfort and strength in each other.—M. W. Linn.

9297. Bengtson, Vern L.; Furlong, Michael J. & Laufer, Robert S. (U Southern California) Time, aging, and the continuity of social structure: Themes and issues in generational analysis. *Journal of Social Issues*, 1974, Vol 30(2), 1-30.—A review of the literature indicates that 3 progressive stages of theory and research in generational analysis can be traced: (a) a "classic" period during which competing perspectives were developed regarding the impact of youth groups on social structure, (b) a phase focused on interpretations of the youth protest movement or on processes in old age, and (c) a period of consolidation with more precise specification of competing theoretical frameworks and the analysis of increasing empirical data. 5 issues which summarize the perspectives of generational analysis are identified and discussed—definition of "generation" as a construct, the degree of continuity between age groups, the persistence of generation units over time, within-generation solidarity, and the articulation between generations and other elements of social structure. A feedback model appears useful in assessing the relationship between generations and social change. (4% p ref)—*Journal abstract*.

9298. Braungart, Richard G. (Syracuse U) The sociology of generations and student politics: A comparison of the functionalist and generational unit models. *Journal of Social Issues*, 1974, Vol 30(2), 31-54.—An examination and comparison of 2 competing interpretations of generational conflict—the functionalist model of S. N. Eisenstadt and T. Parsons and the generational unit model of K. Mannheim—reveals that the generational unit model provides more theoretical and empirical opportunities for investigation than the functionalist model. While both interpretations share similar sequential characteristics, each predicts the emergence of youth politics employing different sets of independent and intervening variables. Both interpreta-

tions appear to be the result of current domestic and international conditions. (3 p ref)—*Journal abstract*.

9299. Brody, Eugene B.; Ottey, Frank & LaGranade, Janet. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **Couple communication in the contraceptive decision making of Jamaican women.** *Journal of Nervous & Mental Disease*, 1974(Dec), Vol 159(6), 407-412.—Almost  $\frac{1}{2}$  of 80 female Jamaica Family Planning Association clients made their decisions to contracept without prior discussion or agreement with their mates. 20 of these women were compared with a group matched according to age and occupation who had discussed contraceptives with mates prior to using them. The prevalent form of cohabitation for both groups was a common-law household. Most regarded Jamaican men as irresponsible and sexually promiscuous, felt a woman's primary responsibility to be to her mother rather than to her mate, were reared in families headed by women, did not believe that they had been given adequate sexual information while growing up, and resented this lack. The unilateral decision makers in contrast to the joint decision makers had initial coitus at a younger age, became pregnant earlier, had more mates, more often regarded husbands as a burden than a help, and had briefer current relationships with mates.—*Journal abstract*.

9300. Carlsmith, Lyn. (Stanford U) **Some personality characteristics of boys separated from their fathers during World War II.** *Ethos*, 1973(Win), Vol 1(4), 466-477.—Compared the aptitudes, interests, and other personality characteristics of boys whose fathers were absent during World War II with those of boys whose fathers were present. A sample of 20 Harvard sophomores from intact families who reported that their fathers had left before they were 6 mo old and had been absent between 22 and 36 mo was compared with a matched sample of 20 students who had not been separated from their fathers. Each S was administered Terman and Miles's Attitude Interest Analysis Test, the Strong Vocational Interest Blank, a semantic differential measuring self-evaluation and potency, and a 2-hr interview. It was found that father-absent Ss showed more feminine vocational interests and more satisfaction with their present identity than did father-present Ss. It is concluded that absence of the father during early childhood has a significant, but not necessarily negative, long-range effect on development.—*J. Kelly*.

9301. Collins, John K. & Harper, Juliet F. (Macquarie U, School of Behavioral Sciences, North Ryde, NSW, Australia) **Problems of adolescents in Sydney, Australia.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 187-194.—Investigated the problems of 514 14-15 yr old male and female adolescents, using an open-ended questionnaire. Results show that while there was a high correlation between problem areas for boys and girls, boys reported more problems concerned with educational adjustment and girls more problems concerned with family adjustments. The mean number of reported problems by girls was significantly higher than those reported by boys. It is concluded that the problems of the Sydney adolescent are basically similar to those of adolescents in other Western cultures. (16 ref)—*Journal abstract*.

9302. Connolly, Kevin & Bruner, Jerome (Eds.). (U Sheffield, England) **The growth of competence.** London, England: Academic Press, 1974. xii, 327 p. \$17.50.—16 papers discuss evolutionary perspectives of the development of moral and social competence in children, as well as the relationship between this competence and mother-child relations, language acquisition, personality, and clinical and social policies.

9303. Danziger, Kurt. (York U, Toronto, Ontario, Canada) **The acculturation of Italian immigrant girls in Canada.** *International Journal of Psychology*, 1974, Vol 9(2), 129-137.—Found that immigrant girls of Italian parentage, in contrast to boys, experience the effects of parental conservatism as it relates to sex roles, expectations, and decision making. Greater conservative demands upon females may reflect a belief that the woman maintains the traditional family culture.

9304. Kol'tsova, M. M. (USSR Academy of Pedagogical Sciences, Inst of Child & Juvenile Physiology, Leningrad) **[Physiological role of verbal signals in the development of voluntary movements.]** (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1972(Jan), Vol 22(1), 10-15.—Compares the views of Russian and foreign authors on the question of which motor reactions to verbal signals are voluntary. Investigation of the reactions of school children to commands indicates that the degree of voluntariness depends mainly on the S's ability to form systems of conditioned connections a priori, and not on the amount of freedom given by different types of command. A state of tonic excitation of the corresponding structures of the brain is suggested as the necessary physiological mechanism for this ability.—*J. Larsen*.

9305. Kolominskii, Ya. L. **[The socio-psychological nature of children's groups.]** (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 31-40.—Reviews the work of the author and others sharing his position on the interaction between the developing and mature personality and society. The work is based on sociometric studies of the intragroup structure of small groups and small group-society relationships. Intragroup relations are described in terms of 2 criteria: level of relational satisfaction and an index of isolation. A mutuality coefficient is computed to describe the internal structure of small groups composed of individuals of different ages. Computations are presented that allow the identification of the structural units of groups, called the range of preferred contacts. The substantive contents of intragroup relations are examined and their influence on personality formation discussed. (English summary)—*L. Zusne*.

9306. Lietaer, Germain. (U Leuven Counseling Ctr, Belgium) **[Netherlands revision of Barrett-Lennard's Relationship Inventory: A factor-analytical approach to student-parent relationships.]** (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(May), Vol 29(3), 191-212.—Revised and extended G. T. Barrett-Lennard's Relationship Inventory (RI) from 64 to 123 items, divided into subscales of empathy, positive disposition, genuineness, and unconditionality. The RI measures the feelings of 1 person towards another and indicates how he thinks the other regards him. The revised form measures the S's regard for his parents and his view of how his parents consider him. Ss were 800 university students; half responded with

reference to their fathers and half with reference to their mothers. Factor analysis indicated the subscales originally identified as empathy, positive disposition, the communicative aspects of genuineness, unconditionality, and directivity. The reliabilities of the first 3 subscales ranged from .80 to .90. The 5 subscales were incorporated into a new test, with 10 items for each subscale.—A. J. Ter Keurst.

9307. Longabaugh, Richard. (Brown U) **Mother behavior as a variable moderating the effects of father absence.** *Ethos*, 1973(Win), Vol 1(4), 456-465.—Tested the hypotheses that father-absent boys have a more feminine semantic style than father-present boys, and that father-absent homes have a higher rate of mother-son interaction than father-present homes. 51 mother-child dyads were selected for study from a group of black, lower-class households. Children ranged in age from 5 to 12 yrs, and 18 were from households in which the father had been absent for at least 2 yrs prior to the study. Mother-child interactions were observed and coded with a resource process coding system, and each child was administered a modified semantic differential test. No significant relationship was found between father absence and masculinity of semantic style of either sons or daughters. Father absence was related to alterations in the behavior of mothers toward sons. It is concluded that increased mother-son interaction moderates the impact of father absence on the femininity of the son's semantic style.—J. Kelly.

9308. Miller, H. Richard & King, E. M. (Southern Illinois U) **Sex education for parents using behavioral rehearsal.** *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 28-31.—Considers that traditional sex education methods have failed. School-centered programs provide too little, too late, but are better than no sex education at all. Sex education programs for parents fail because they do not reduce the parents' anxiety in talking about sex and do not permit the parents to practice. A new approach to sex education for parents using behavior rehearsal—Behavior Rehearsal Adult Sex Education, BRASE—is described. Behavior rehearsal involves having parents role play in response to children's questions and giving them helpful feedback on their performance. A posttraining questionnaire sent to 82 participants in this program indicates that behavior rehearsal significantly improves parents' ability to talk with their children about sex. (Spanish & French abstracts)—*Journal abstract*.

9309. Miller, Warren B. (Stanford U, Medical School, Lab of Behavior & Population) **Relationships between the intendedness of conception and the wantedness of pregnancy.** *Journal of Nervous & Mental Disease*, 1974(Dec), Vol 159(6), 396-406.—Studied the relationship between the "intendedness" of conception and the "wantedness" of pregnancy in 221 predominantly white, middle-class women who reported on 379 conception-pregnancies. Virtually all consciously intended conceptions led to fully wanted pregnancies, but conceptions resulting from inadequate contraception or from contraceptive accidents fell evenly across the full range of wantedness. Ss had a "wantedness reserve," in that 15% of the conceptions were subintended (i.e., were less than fully intended), yet led to fully wanted pregnancies. The

absolute levels of intendedness and wantedness and the wantedness reserve varied during the different sexual-procreational phases of the Ss' life cycle. These variations confirmed the existence of 4 previously hypothesized points in the life cycle during which women are especially vulnerable to the occurrence of an unwanted pregnancy. The variations in the wantedness reserve showed some independence from the measures of intendedness and wantedness, supporting the proposition that the wantedness reserve is a fertility measure which deserves separate consideration.—*Journal abstract*.

9310. Salas, Eduardo J. [Notes on the study of the role of parents in development, technical consequences, and applications in psychotherapies.] (Span) *Revista de Psicoanálisis*, 1974(Jan-Jun), Vol 31(1-2), 403-438.—Presents a synthesis of ideas on the role of parents, especially the father, in the psychoanalytic development of children.

9311. Schwartz, Barbara K. (U New Mexico, Medical School) **Easing the adaptation to parenthood.** *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 32-39.—Recent data has suggested that a critical bonding period immediately following birth is present in humans as well as in certain other mammals. This bonding may be disrupted by a variety of factors including hospital procedures and postpartum emotional problems and, if disrupted, may be a contributing factor in such problems as child abuse. Criteria for spotting "high-risk parents" are enumerated, and a group approach is suggested which could help members adapt to their roles as parents. (Spanish & French abstracts) (3/4 p ref)—*Journal abstract*.

9312. Stokols, Daniel. (U California, Program in Social Ecology, Irvine) **Toward a psychological theory of alienation.** *Psychological Review*, 1975(Jan), Vol 82(1), 26-44.—Views the experience of alienation as a sequential-developmental process which (a) develops in the context of an ongoing relationship between an individual and another person or group of people, (b) involves an unexpected deterioration in the quality of outcomes provided to the individual by the other(s), and (c) persists to the extent that the individual and the other(s) remain spatially or psychologically proximal. On the basis of 2 variable components, personal-neutral thwarting and salience-nonsalience of alternatives, a typology of estrangement experiences is proposed which includes 4 behavioral syndromes: isolation, reintegration, subjugation, and rebellion. Though in each of these syndromes the individual's appraisal of the situation leads to at least temporary disillusionment, the induction of persisting cognitive changes as a result of one's exposure to personal thwarting by another is viewed to be the central and unique feature of the alienation experience. (51 ref)—*Journal abstract*.

9313. Wills, Thomas A.; Weiss, Robert L. & Patterson, Gerald R. (U Oregon) **A behavioral analysis of the determinants of marital satisfaction.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 802-811.—Tested hypotheses about the determinants of global ratings of marital satisfaction, the role of reciprocity in marital interaction, and the influence of external experiences on the marital relationship. 7 nondistressed

married couples made daily observations of their spouse's pleasurable and displeasurable behavior for 14 consecutive days and daily ratings of the enjoyability of their outside experiences and of their satisfaction with the relationship. Multiple regression analysis, with satisfaction ratings as the criterion variable, showed that both types of displeasurable behavior contributed to rated satisfaction, accounting together for 65% of the explainable variance. For pleasurable behaviors, a sex difference was noted, with males emphasizing pleasurable instrumental behaviors from their spouses and females emphasizing pleasurable affectional behavior. The immediate tendency to reciprocate displeasurable behaviors was stronger than that for pleasurable behaviors. The influence of external experiences was negligible. (23 ref)—*Journal abstract*.

9314. Wilson, Richard W. (Rutgers State U) **Learning to be Chinese: The political socialization of children in Taiwan.** Cambridge, MA: MIT Press, 1970. xiii, 203 p. \$2.95.—Attempts to explain the often puzzling behavior of the Chinese in terms of the concept of "face" and how Chinese children acquire attitudes toward authority, group cohesiveness, acceptable targets for aggression, and other nonpolitical but relevant aspects of personality. Data from 3 large primary schools are presented, and the relationships of "face" to group loyalty, political hierarchies, and political stability and how this relationship affects the style of government in China are discussed. (6½ p ref)

9315. Wolfgang, Charles. (Ohio State U) **An exploration of the relationship between the cognitive area of reading and selected developmental aspects of children's play.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 338-343.—Reports on the relationship between the level of play attained by a child and his initial reading ability, using L. S. Vygotski's schemata to classify the child's level of play. Ss were 30 1st-grade boys who were classified as good or poor readers on the basis of the paragraph meaning scores of the Stanford Achievement Test. The better readers appeared to achieve the dramatic level of play while the poor readers were still engaged in fantasy play.—H. Kaczowski.

#### Adult Development & Aging

9316. Ames, Louise B. **Calibration of aging.** *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 507-529.—Studied 92 57-92 yr old Ss to find a battery of psychological tests which would effectively measure their level of intactness or deterioration of function. 5 tests were used: the Rorschach Test, Gesell Incomplete Man Test, Bender Gestalt, Monroe's Visual Three, and the Color Tree Test. Ss were identified as normal adult, intact presenile, medium presenile, and deteriorated, on the basis of their Rorschach response. To check on the adequacy of this sorting, responses of each group were averaged for each of the other 4 tests. Differences between the several groups, on every test, were significant as measured by the median test ( $p < .001$ ).—*Journal abstract*.

9317. Butler, Robert N. (Washington School of Psychiatry, DC) **Successful aging and the role of the life review.** *Journal of the American Geriatrics Society*, 1974(Dec), Vol 22(12), 529-535.—Contends that the

negative view of old age, with its across-the-board labels of unproductivity, inflexibility, and senility, must be changed if the elderly are to have more opportunities for successful aging. It is stressed that there is a distinct difference between the intrinsic features of aging and the reactions of the elderly to their lives. Old age can be a period in which unique developmental work can be accomplished, a time when one can find use for what he has obtained in a lifetime of learning and adapting. Review therapy and life-cycle group therapy are cited as effective aids in this direction.—*Journal abstract*.

9318. Douse, Len. **Older people: Recreation's greatest challenge?** *Journal of Leisureability*, 1974(Oct), Vol 1(4), 18-24.—Stresses the life-long nature of the learning process and the need to continue this process into old age. Preretirement education which teaches people to deal effectively with their changed circumstances is suggested, and it is noted that many older people are capable of learning new physical and mental skills.

9319. Giambra, Leonard M. (National Inst of Child Health & Human Development, Gerontology Research Ctr, Baltimore, MD) **Daydreaming across the life span: Late adolescent to senior citizen.** *International Journal of Aging & Human Development*, 1974(Spring), Vol 5(2), 115-140.—Used the Imaginal Processes Inventory to investigate the effects of aging on daydreaming and related mental activity in 378 predominantly white middle-class or upper middle-class males 17-91 yrs old. Daydreaming frequency declined linearly with age. A linear decline was also observed in absorption in daydreaming, daydreams with future temporal settings, affective reactions in daydreams, imagery and vividness in daydreams, and content involving sex, bizarre-improbable events, achievement, hostility, heroism, fear of failure, and guilt. No decline was observed for acceptance of daydreams, impersonal and interpersonal curiosity, mentation rate, past and present temporal setting in daydreams, and daydreams involving problem solving. Problem-solving daydreams were predominant at every age except the youngest where sexual daydreams predominated. A factor analysis revealed 7 factors, 4 of which involved age. It is concluded that daydreaming reflects current concerns and not suppressed desires.—*Journal abstract*.

9320. Heritage, Jeannette G. & Daniels, Jack L. (Middle Tennessee State U) **Postdivorce adjustment.** *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 44-49.—Administered the 16 Personality Factor Questionnaire and A. H. Hilden's Q-Sort of Personal Constructs to 104 divorced persons. Ss were classified according to the degree of postdivorce adjustment, degree of religious activity, presence or absence of children during the marriage, duration of marriage (more or less than 10 yrs), time since divorce (more or less than 2 yrs), degree of contact with ex-spouse, and sex. 2 factors—Apprehension (O) and Tenseness (Q)—contributed most to significant differences between the "better adjusted" and "poorer adjusted" (assessed by Q-sort results). The effects of the other variables appeared to be contingent on degree of adjustment. Advantages of the Q-sort in assessing adjustment of divorced persons are noted, and

6 recommendations for studying the effects of divorce are presented. (Spanish & French abstracts)—*L. Gorsey.*

9321. **Hutchison, Sam L.** (West Virginia Inst of Technology) **An investigation of learning under two types of social reinforcers in young and elderly adults.** *International Journal of Aging & Human Development*, 1974(Spr), Vol 5(2), 181-186.—Compared the verbal learning performance of 54 young Ss (median age 20 yrs) and 54 elderly Ss (median age 75 yrs) under a factorial design employing praise and reproof and verbal feedback as social reinforcers. Regardless of age group, all Ss made fewer errors under a feedback condition where a correct response was reinforced with a "right" and an incorrect response was not responded to by the E. Elderly Ss performed equally well under praise, reproof, and a neutral control condition. Younger Ss showed superior performance under the control treatment and poorer learning under both praise and reproof.—*Journal abstract.*

9322. **Jacobs, Jerry.** (Syracuse U) **An ethnographic study of a retirement setting.** *Gerontologist*, 1974(Dec), Vol 14(6), 483-487.—Data from a year-long study of residents in a white middle- to upper-class retirement community, heralded as a model retirement setting, show that promises of an active way of life went unfulfilled. The data, however, are contrary to the expectations of disengagement theory.

9323. **Katz, Michael M.** (VA Hosp, Allen Park, MI) **The effects of aging on the verbal control of motor behavior.** *International Journal of Aging & Human Development*, 1974(Spr), Vol 5(2), 141-156.—Investigated the effects of aging on self-control within the framework of A. Luria's theory of the verbal regulation of motor behavior. 48 Ss 65-96 yrs old were given a set of 24 tasks requiring them to either make or inhibit a motor response (pushing a lever) in the presence of different combinations of verbal and physical stimuli. Self-control was also assessed by their ability to write the phrase "New Jersey Chamber of Commerce" as slowly as possible. Performances on the 24 tasks were compared with those of children in previous research. It was found that verbal control of behavior remained strong until very late in life. Ss who did well on the 24 tasks displayed more self-control on the slow writing test, had faster regular writing speed, and were more active physically and socially in their everyday lives than those who did poorly. (20 ref)—*Journal abstract.*

9324. **Klassen, Deidre; Roth, Aleda & Hornstra, Robijn K.** (Greater Kansas City Mental Health Foundation, MO) **Perception of life events as gains or losses in a community survey.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 330-336.—Attempted to determine whether there are perceived differences in the desirability of life events for different groups of people. 190 adults aged 18 yrs or older rated 40 events as to whether they represented a gain or a loss (i.e., whether people would generally find the events desirable or undesirable). These ratings were analyzed across groups according to the sex, age, marital status, education, and race of the respondent. Findings indicate there was not great consensus about the gain-loss value of the items, but there was much agreement in the right direction. Only 15 of the 40 items showed agreement of 90% or more, whereas about

1/4 of the items showed agreement of 80% or more. Previous research found surprisingly high correlations on magnitude ratings across race, sex, age, marital status, education, and social class. Results of this study do not refute this finding, as the similarities for groups outweighed the differences. (16 ref)—*P. O'Brien.*

9325. **Kuypers, Joseph A.** (U California, Inst of Human Development, Berkeley) **Ego functioning in old age: Early adult life antecedents.** *International Journal of Aging & Human Development*, 1974(Spr), Vol 5(2), 157-179.—Examined the relationship between adaptability in old age and intelligence, health, socioeconomic status (SES), personality, and family relations in young adulthood. Correlations are reported between 3 alternative measures of old age adaptability (coping, defense, and disorganization) and measures in 5 areas of status and behavior in young adulthood (representing a 40-yr longitudinal analysis). Coping ability in old age is most associated with variations in intellectual capacity and SES, especially for women. Ego disorganization in old age is most related to variations in SES and family relations in young adulthood. The data suggest that adaptability in old age is associated with environments and behaviors early in adult life, but that the strength of the association over time varies according to the sex of the S, the model of old age adaptability used, and the aspects of status and behavior considered in young adulthood.—*Journal abstract.*

9326. **Lawton, M. Powell & Cohen, Jacob.** (Philadelphia Geriatric Ctr, PA) **Environment and the well-being of elderly inner-city residents.** *Environment & Behavior*, 1974(Jun), Vol 6(2), 194-211.—Attempted to estimate, using multiple regression methods, behavior attributable to environmental as compared with social factors. The well-being of 115 elderly Jewish residents of a high-crime, predominantly black slum in Philadelphia was studied in relation to demographic and environmental factors. The 6 environmental factors, reduced by principal components analysis from 34 environmental attributes obtained by observational methods, were (a) distance from area with high Jewish concentration, (b) distance from facilities, (c) independence of the household, (d) level of activity of people and vehicles on the S's block, (e) well-kept neighborhood, and (f) living on a residential block. Well-being was measured by indices derived from hour-long interviews: motility, morale, housing satisfaction, peer interaction, family interaction, and responsiveness to the interviewer. Neighborhood motility was high in areas of high Jewish concentration, with many independent households that tended to be distant from resources. The Ss rated as most alert and responsive by interviewers tended to live in the area of high Jewish concentration and in well-kept neighborhoods. Results demonstrate the explanatory power of environmental factors in some areas of behavior.—*S. T. Margulis.*

9327. **Levy, Judith M. & McGee, Richard K.** (U Florida, J. Hillis Miller Health Ctr) **Childbirth as a crisis: A test of Janis's theory of communication and stress resolution.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 171-179.—Investigated the relationship between expectation and subjective outcome in childbirth. 60 primigravidae responded to a question-

naire before and after labor and delivery. The evaluation of childbirth as favorable or unfavorable was related to whether the experience was rated better or worse than expectation. Anticipation of labor and delivery was positively related to a woman's perception of her mother's experience in childbirth, but was not related to the woman's evaluation of her actual delivery experience. Women receiving extreme communications or no information from their mother reported poorer outcomes than women who received moderate communications. Anxiety, as measured by the Taylor Manifest Anxiety scale, and denial, as measured by the Self-Criticism scale of the Tennessee Self-Concept Scale, were not related to anticipation or subjective outcome measures. Results support I. L. Janis's 1958 theory of psychological stress.—*Journal abstract.*

9328. Petrov, Ya. I. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General Adult Education, Leningrad) [Changes in the memory function in adults.] (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 145-149.—Studied age-related changes in short- and long-term memory in adults 18-40 yrs old. The sample of 460 Ss was stratified according to age, sex, and education. Measures on 14 memory tests were scaled, with a mean of 100 and a standard deviation of 15, and intercorrelated. Age-related changes in the memory structure are described, of which the most salient are the fluctuation of memory measures between the ages of 18 and 40 yrs and the increase in the size of correlation among them with increasing age. (15 ref)—*L. Zusne.*

9329. Rindskopf, Kathryn & Charles, Don C. (Iowa State U) Instructor age and the older learner. *Gerontologist*, 1974(Dec), Vol 14(6), 479-482.—Conducted a study to determine whether learning is facilitated when teacher and student are of the same age group. Old and young instructors taught old and young students in controlled circumstances. Teachers were 4 25-yr-old male graduate students and 4 active or retired 55-70 yr old male professors. Learners were 40 female college students aged 17-23 yrs and 40 females aged 56-92. Results indicate no like-age facilitation; older learners profited from either age instructors, as did the young. The latter, however, preferred older instructors while older students liked both.—*Journal abstract.*

9330. Squire, Larry R. (U California, Medical School, La Jolla) Remote memory as affected by aging. *Neuropsychologia*, 1974(Oct), Vol 12(4), 429-435.—Exp I assessed memory for public events that occurred between 1930-1972 in 94 50-89 yr old medical inpatients of average education. With increasing age, performance declined similarly for all time periods sampled. No evidence for the selective preservation of remote memory was obtained. Similar results were found in Exp II in 101 60-89 yr old highly educated Ss. Results are taken to mean that aging produces a deficiency in recall that can extend to much, if not all, of remote memory. (French & German summaries) (20 ref)—*Journal abstract.*

Austria) [Forced marriage and the divorce court.] (Germ) *Praxis der Psychotherapie*, 1973(Jun), Vol 18(3), 104-113.—Reports on the incidence of marriages in Austria that were necessitated by premarital pregnancy and later ended in divorce.

9332. MacDonald, A. P. (U North Carolina, Developmental Disabilities Technical Assistance System, Chapel Hill) The importance of sex-role to gay liberation. *Homosexual Counseling Journal*, 1974(Oct), Vol 1(4), 169-180.—Conducted a study with 101 college students and faculty to determine characteristics of people who hold positive and negative attitudes toward homosexuality. In addition to a homosexual attitude scale, Ss were given the Intimacy Permissiveness Scale, and the Premarital Sexual Permissiveness Scale. Results indicate that Ss who held more negative attitudes toward homosexuals were more (a) likely to support a double standard between the sexes, (b) cognitively rigid, (c) intolerant of ambiguity, and (d) authoritarian. Data support the belief that attitudes toward homosexuals are maximally determined by the need to preserve masculine and feminine roles, and minimally determined by conservative sexual standards. (21 ref)—*Journal abstract.*

#### Culture & Ethnology & Race Relations & Religion

9333. Anant, Santokh S. (U Lethbridge, Alberta, Canada) The effect of political realignments during an armed conflict on ethnic stereotypes. *International Journal of Psychology*, 1974, Vol 9(2), 139-144.—Immediately before and after the 14-day Indo-Pakistani war, the same group of 42 Indian postgraduate students responded to a stereotype checklist that called for marking 5 traits judged most characteristic of persons of each of 7 nations. Following the war, stereotypic shifts toward positive perception accompanied ratings of nations that had favored India while perception of those that favored Pakistan became more negative.—*E. A. Gavin.*

9334. Ayres, Barbara. (U Massachusetts, Boston) Effects of infant carrying practices on rhythm in music. *Ethos*, 1973(Win), Vol 1(4), 387-404.—Studied the relationship between cross-cultural variations in the frequency and importance of regular rhythm in music and the amount of infantile stimulation derived from body contact with the mother. The psychological origins and functions of music are discussed. (26 ref)

9335. Banton, Michael. (U Bristol, England) 1960: A turning point in the study of race relations. *Daedalus*, 1974(Spring), Vol 103(2), 31-44.—Recommends that future research in race relations use multivariate methods of analysis. The price placed on the results of prejudices should be investigated as well as the phenomenon of race consciousness itself.

9336. Bennett, Don C. (Indiana U) Interracial ratios and proximity in dormitories: Attitudes of university students. *Environment & Behavior*, 1974(Jun), Vol 6(2), 212-232.—Surveyed 432 white and 92 black undergraduates, integrated in university dormitories, and representing 5% of the whites and 20% of the blacks in the dormitories, regarding their opinions about interracial

#### CULTURAL INFLUENCES AND SOCIAL ISSUES

9331. Cermak, Ida. (U Vienna, Psychiatric Clinic,

proximities and proportionalities. Both groups indicated they could feel comfortable with a higher percentage of the other race present than they preferred. However, blacks required fewer persons of their own race on their floors or in their buildings to feel comfortable than did whites. Both groups agreed that it was uncomfortable to be the only person attitudes their race on a floor or in a building. Both groups expressed preference for at least 50% occupancy by persons of their own race on their floor or in their building. A sizable minority in each group preferred own-group numerical dominance to 75% or more of the total. Interracial room-sharing, an unfamiliar experience for Ss, was acceptable, but objections to room-sharing were greater among blacks. A majority of both groups believed that voluntary segregation had occurred in the dormitories. Voluntary segregation was perceived as desirable by blacks, undesirable by whites. Previous interracial contacts, and intraracial sex differences in attitudes, are also presented. (15 ref)—S. T. Margulis.

9337. Berger, Bennett M. & Hackett, Bruce H. (U California, San Diego) **On the decline of age grading in rural hippie communes.** *Journal of Social Issues*, 1974, Vol 30(2), 163-183.—Ethnographic data from a study of rural hippie communes suggest a clear attenuation of the normative differences usually ascribed to children on the grounds of their age. The participation of children in drug use and sex, as well as their autonomy in the settlement of their disputes, are cited as examples of this decline in age grading. Interpretations are offered of the ways in which this equalitarian conception of children is systematically sustained by other facts of communal life and by the ideological postures of parents. Finally, inferences are made from the decline of age grading in the communes of the counterculture for possible changes in the relations between the generations in the future.—*Journal abstract.*

9338. Bruner, Edward M. (U Illinois) **The missing tins of chicken: A symbolic interactionist approach to culture change.** *Ethos*, 1973(Sum), Vol 1(2), 219-238.—Discusses the psychological concomitants of rapid social change among the Toba Batak group of Sumatra and among American Indians. It is suggested that the Batak have escaped severe psychological stress by incorporating modernization into their traditional kinship and ritual organizations. (22 ref)

9339. Bullard, M. Kenyon. (U South Alabama) **Hide and secrete: Women's sexual magic in Belize.** *Journal of Sex Research*, 1974(Nov), Vol 10(4), 259-265.—Presents an interpretive description and analysis of certain magical practices used by women in Belize.

9340. Caudill, William. **The influence of social structure and culture on human behavior in modern Japan.** *Ethos*, 1973(Fal), Vol 1(3), 343-382.—Discusses the psychological and behavioral implications of the combination of social change and cultural continuity in modern Japan. It is suggested that modern social structure and traditional culture have independent effects on psychological adjustment in Japan. (9 p ref)—J. Kelly.

9341. Chandler, Charles R. (Texas Tech U) **Value orientations among Mexican Americans in a southwestern city.** *Sociology & Social Research*, 1974(Apr), Vol

58(3), 262-271.—Asked a random sample of 300 Mexican-American men and women in an urban setting value orientation questions related to activity, integration with kin, trust, and occupational primacy. As hypothesized, "modern" orientations were expressed by younger respondents with more formal schooling and higher-status occupations. The majority gave "traditional" responses. Results are discussed in relation to other studies and in light of "modernism" theory.—*Journal abstract.*

9342. Chang, Theresa S. (Kansas State U, Coll of Education) **The self-concept of children of ethnically different marriages.** *California Journal of Educational Research*, 1974(Nov), Vol 25(5), 245-252.—Administered the Piers-Harris Children's Self-Concept Scale to 251 4th-, 5th-, and 6th-grade children of ethnically similar marriages and 98 children from ethnically different marriages. All Ss were from 2 schools in a low socioeconomic status community. Ss' reading and mathematics scores were also examined in relation to the self-concept measure. Children of mixed parentage had higher mean self-concept scores than children of similar parentage. Mixed-parentage Ss also had higher scores on reading and mathematics achievement tests. Significant differences in the same direction were also found on the Behavior subscale of the self-concept measure. It is concluded that all individuals occupying a marginal status in society should not be expected or assumed to have marginal personality characteristics.—L. Gorsey.

9343. Cress, Joseph N. & O'Donnell, James P. (Southern Illinois U, Carbondale) **Indianness, sex, and grade differences on behavior and personality measures among Oglala Sioux adolescents.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 306-308.—Studied the degree of acculturation of 104 Oglala Sioux to the dominant American culture. The study is an extension of J. F. Bryde's findings and the results are similar to those reported by him.

9344. Cusick, Philip A. & Ayling, Richard J. (Michigan State U) **Biracial interaction in an urban secondary school.** *School Review*, 1974(May), Vol 82(3), 486-494.—Attempted to study what activities black and white students jointly engage in when they attend desegregated schools. For 6 mo the authors attended classes a few days a week. Data were collected through informal interviews, background material, and scheduled formal interviews. Interracial interaction occurred only when the students were academically motivated and the teacher was highly structured. Generally there was significant separation between the races and evidence of deep racial hatred.—C. K. Miller.

9345. Denis, Margaret. (Canadian Catholic Conference, Winnipeg, Manitoba) **Religious education among North American Indian peoples.** *Religious Education*, 1974(May), Vol 69(3), 343-354.—Indians of Western Canada show at least 3 different degrees of assimilation to the white man's technological culture. Understanding the mentality and values of the native people, regardless of their degree of assimilation, is basic to any religious education program. Western white society is characterized by linear thinking patterns, whereas these Indians tend to think and reason spirally, going around the point with concrete stories and examples until the point is

established. Native speech abounds in concrete rather than in abstract expressions, and dynamic action verbs generally take the place of the verb "to be." The Indians show a greater propensity for contemplation than whites, and understand symbols and parables more easily. Their principal values include respect for the person, respect for nature, and a sense of time based on the changing seasons.—E. A. Gavin.

9346. Elias, John L. (Trenton State Coll) B. F. Skinner and religious education. *Religious Education*, 1974(Sep-Oct), Vol 69(5), 558-567.—Discusses Skinner's views of religion in relation to freedom and to fear. His insights on religion and behavior modification, behaviorism and religious beliefs, and Utopianism indicate that he should not be ignored by religious educators, especially since his thought represents the scientific and technological culture within which religion is currently taught.

9347. Feather, Norman T. & Hutton, Malcolm A. (Flinders U South Australia, Bedford Park) Value systems of students in Papua New Guinea and Australia. *International Journal of Psychology*, 1974, Vol 9(2), 91-104.—1,100 indigenous English-speaking Ss from Papua New Guinea, enrolled in tertiary institutions and training programs or serving as headmasters, and making up 12 subsamples (mean age 18.74 yrs for university students, 29.23 yrs for inspectors and headmasters) completed the Rokeach Value Survey anonymously, and provided information about age, sex, course of study, religion, clan, home, and district. Average value systems of these Ss were compared with those of approximately 3,900 Australian secondary and university students with Papua New Guinea Ss, revealing greater concern among Papuan students with general social values, with orthodox religious values, and with values implying deference to authority, and among Australian students greater concern with personal, humanistic values. Factor analyses of the 12 Papua New Guinea subgroups revealed general similarities in average value systems across all groups but suggested some differences in the case of instrumental values, a finding hard to interpret since it is confounded with differences in age. Results in Papua that reflect emphasis upon safety and security needs, contrast with emphasis in Australian Ss upon competence and self-actualization. The differences are related to level of development of the respective countries and to history of the areas (especially the missionary influence, extended families, and concern with emerging nationhood). (30 ref)—E. A. Gavin.

9348. Harkness, Sara. (Harvard U) Universal aspects of learning color codes: A study in two cultures. *Ethos*, 1973(Sum), Vol 1(2), 175-200.—Studied the universality and evolution of color naming among children and adults in 2 differing cultures. 60 Spanish speaking Ss from 3 age brackets (7-8 yrs, 11-12 yrs, and adult) and 40 Mam speaking Ss from 2 age brackets (7-8 yrs and adult) were chosen for study from 2 small rural communities in Guatemala. Ss were asked to perform color naming, recognition, and selection tasks using Munsell color chips. It was found that there was a high degree of agreement between Spanish and Mam speaking Ss on best examples of corresponding color terms. Agreement on color naming between Ss speaking the

same language decreased as colors moved farther from the focal areas of best color representatives. Results from Spanish speaking Ss indicated that some basic color terms (e.g., pink, orange) were "less basic" than other basic color terms (e.g., red, green). It is concluded that the results support previous findings on the universality and evolution of basic color terms.—J. Kelly.

9349. Hippler, Arthur E. (U Alaska, Inst of Social, Economic, & Government Research) Patterns of sexual behavior: The Athabascans of interior Alaska. *Ethos*, 1974(Spr), Vol 2(1), 47-68.—Discusses the relationships between personality, sociocultural phenomena, and sexual behavior among the Athabascans. Field observations and projective test protocols were collected from individuals in 4 Athabascan villages and in Fairbanks, Alaska. It is noted that sexual activities are a source of fear and anxiety for both male and female Athabascans, and that sexual intercourse is often accompanied by intoxication and violence. Childhood in Athabascan society was found to be characterized by recurrent threats of hunger, frequent death of siblings, and perception of the mother as sad and distant. It is suggested that these conditions create an Athabascan personality structure based on deeply repressed anger, suppression of affect, and feelings of essential badness. It is concluded that present Athabascan sexual patterns are due to a combination of traditional child-rearing conditions and loosening of previous social controls over aberrant sexual expression. (3 p ref)—J. Kelly.

9350. Johnson, Arthur L.; Brekke, Milo L.; Strommen, Merton P. & Underwager, Ralph C. (U Minnesota, Minneapolis) Age differences and dimensions of religious behavior. *Journal of Social Issues*, 1974, Vol 30(3), 43-67.—Explored the magnitude, sources, and consequences of differences among age strata in various dimensions of religious orientation and practice. Results support a "selective gap" theory rather than a "great gap" interpretation of contrasts among age strata. 19-23 yr olds were most heterogeneous in beliefs, attitudes, or life-styles. (51 ref)

9351. Joyce, J. T. A preliminary study of cultural differences in values influencing western education in the Enga district: II. Moral development and cognitive factors. *New Guinea Psychologist*, 1974(Aug), Vol 6(2), 63-77.—Provides a follow-up analysis and discussion of the author's earlier study in which a questionnaire was administered to 2 groups of Papua New Guineans who differed in amount of exposure to Western influences. Differences in moral development between the 2 groups were hypothesized on the basis of significant differences on responses to questionnaire items dealing with such concepts as stealing and the characteristics that make an act "bad." It is concluded that, despite these differences, the more remote tribe is not underdeveloped in terms of value systems. Educational procedures that are less authoritarian and more consistent with basic tribal language and philosophy are recommended. (2½ p ref)—C. Wright.

9352. Lex, Barbara W. (Western Michigan U) Voodoo death: New thoughts on an old explanation. *American Anthropologist*, 1974(Dec), Vol 76(4), 818-823.—Augments extant physiological explanations of "voodoo death" with information about neurophysiological re-

search on sensitization, or tuning, of the autonomic nervous system. The process of suggestion is defined as incorporating both an automatic and cognitive component in tuned individuals: the significance of autonomic tuning in cause and cure of psychosomatic illness and in voodoo death is explored.—*Journal abstract.*

9353. **Montgomery, Rita E.** (Meramec Community Coll) **A cross-cultural study of menstruation, menstrual taboos, and related social variables.** *Ethos*, 1974(Sum), Vol 2(2), 137-170.—Studied the relationship between severity of menstrual taboos and vagina envy as evidenced by the degree of male participation in birth and reproduction rituals in 44 societies. Chi-square tests show a strong relationship. (2 p ref)

9354. **Murphy, Jane M.** (Harvard U, School of Public Health) **Sociocultural change and psychiatric disorder among rural Yorubas in Nigeria.** *Ethos*, 1973(Sum), Vol 1(2), 239-262.—Studied the effects of Western education, modern occupations, and nontraditional religious affiliation on the mental health of 138 Yoruba men. It is suggested that high risks of psychological maladjustment in changing societies result from poor integration of new and traditional social processes, rather than from modernization per se. (22 ref)

9355. **Price, John A.** (York U, Downsview, Ontario, Canada) **The superorganic fringe: Protoculture, idioculture, and material culture.** *Ethos*, 1973(Sum), Vol 1(2), 201-218.—Discusses the relationship of the origins of superorganic culture among humans to the behavioral learning abilities of animals. The usefulness of the concepts of protoculture, idioculture, and material culture, and of the distinction between sign and symbol in examinations of the development of superorganic culture are explored.

9356. **Saunders, John; Davis, J. Michael & Monsees, David M.** (Mississippi State U) **Opinion leadership in family planning.** *Journal of Health & Social Behavior*, 1974(Sep), Vol 15(3), 217-227.—Interviewed 587 clients at a family planning clinic in Lima, Peru, who were classified as opinion leaders, ineffectives, or followers, and as early or late adopters and pre- or postacceptors. Education, income, motivation, mass media exposure, length of time in current house, fertility, and information transactions were positively associated with opinion leadership.

9357. **Schwartz, Theodore.** (U California, San Diego) **Cult and context: The paranoid ethos in Melanesia.** *Ethos*, 1973(Sum), Vol 1(2), 153-174.—Discusses the cargo cults of Melanesia as modes of psychocultural adjustment to contact with Western cultures. It is suggested that the internalized personality structures and the institutionalized structures of Melanesia have a strongly developed paranoid ethos which leads to both extreme suspicion and extreme credulity. (35 ref)

9358. **Scott, William C.; Johnson, Craig & Bailey, Roger C.** (Oklahoma State U) **The influence of the experimenter attributes and the labeling of an attitude object on the measurement of prejudice.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 299-300.—Investigated the effects of the attitude object label "Negro" or "black" and the E's personal attributes on the measurement of prejudice, using C. Sellitz and S. Cook's

(1970) instrument. Findings demonstrate the complexity of the influence of the E's attributes.

9359. **Sowell, Thomas.** (Urban Inst, Washington, DC) **The plight of black students in the United States.** *Daedalus*, 1974(Spr), Vol 103(2), 179-196.—Black intellectuals and academic persons agree almost unanimously that black students are placed under tremendous pressures by white institutions. The use of double standards does not alleviate, but in subtle ways increases, the pressures through increasing the degree of alienation.

9360. **Spiegel, Leo A.** **Youth, culture and psychoanalysis.** *American Imago*, 1974(Sum), Vol 31(2), 206-231.—Discusses the influence of 20th century cultural changes on the psychic structure of youth and on youth's attitudes toward psychoanalysis. It is suggested that the young have undergone collective regression in response to the prevailing unconscious collective atmosphere of death, depression, and meaninglessness. This regression is manifested with youth's preoccupation with the immediate and tangible and in its restless desire for social change. Disillusionment with psychoanalysis is merely one aspect of general cultural disillusionment on the part of the young. It is concluded that psychoanalysis can still be beneficial for young people, but that its ultimate benefit will depend, in part, on the meaningfulness or meaninglessness of the culture in which the analysts must live. (44 ref)—*J. Kelly.*

9361. **Stein, Howard F.** (Meharry Medical Coll) **Confirmation of the white ethnic stereotype.** *School Review*, 1974(May), Vol 82(3), 437-454.—Studied a Catholic high school with a majority of Polish-American students in relation to a reciprocal-cumulative causation theory of prejudice. Using a transactional model of analysis, it was determined that the student's poor performance and resistance to learning provide both teachers and students with a self-fulfilling prophecy. Family, school, and community together perpetuate by constant recreation a psychosocial identity which is rooted in failure. (15 ref)—*C. K. Miller.*

9362. **Stein, Howard F.** (Meharry Medical Coll, Community Mental Health Ctr) **Envy and the evil eye among Slovak-Americans: An essay in the psychological ontogeny of belief and ritual.** *Ethos*, 1974(Spr), Vol 2(1), 15-46.—Discusses the interpersonal and intrapsychic dynamics of the acquisition and influence of belief in the "evil eye" among Slovak-Americans. The development of the evil eye in a particular individual is attributed in Slovak oral tradition to allowing breast feeding after sudden weaning. The evil eye in traditional Slovak life acted as an explanation of misfortune and malevolence and as an effective means of social control. It is suggested that the evil eye symbolically embodies the contradictory protective and projective elements of the Slovak jealousy ethos which developed in response to competition for limited material goods and demonstrations of affection. It is concluded that belief in the evil eye is related to both environmental factors and child-rearing practices. (3 p ref)—*J. Kelly.*

9363. **Stewart, V. Mary.** (York U, Toronto, Ontario, Canada) **A cross-cultural test of the "carpentered world" hypothesis using the Ames Distorted Room illusion.** *International Journal of Psychology*, 1974, Vol 9(2), 79-89.—120 American school children stratified by

race, sex, and age (6-17 yrs) and 432 nonwhite Zambian Ss similarly stratified by age, sex, and also by degree of environmental carpenteredness (which yielded 5 subsamples) experienced, on successive trials, a randomized series of 10 different-sized rods that appeared in the left and right windows of the Ames distorted room. On each trial, S selected from unmounted rods the rod that appeared to be like the one he had just seen. The difference between mean responses to the 10 stimuli shown in the left window and the responses to the same 10 stimuli shown in the right window yielded a measure of illusion susceptibility. Size of correlation coefficient that resulted from relating actual stimulus size to response measures determined ordinal accuracy. Results generally support the empiricist position of illusion susceptibility. No significant effect of pigmentation upon response appeared within the American samples, but a direct relationship between environmental carpenteredness and illusion susceptibility appeared for the 5 Zambian subsamples. Older Ss showed less susceptibility to illusions than younger Ss, and female Ss revealed significantly greater illusion-susceptibility than did males. (23 ref)—*E. A. Gavin.*

9364. Sutcliffe, Claud R. (U of the South) **Achievement motivation and economic development among peasants: An exploration of measurement problems.** *Rural Sociology*, 1974(Sum), Vol 39(2), 238-246.—Interviewed Palestinian refugees and nonrefugees to test the hypothesis that achievement motivation is partially responsible for economic growth. Results suggest there was little correlation between achievement motivation and economic growth.

9365. Thomas, David R. (U Waikato, Hamilton, New Zealand) **The relationship between ethnocentrism and conservatism in an "authoritarian" culture.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 179-186.—Results of a study of 56 Australian mothers show highly significant correlations between scores on the Wilson-Patterson Conservatism scale and 2 measures of ethnic prejudice among Ss. While social processes are seen as an important determinant of differences between cultural groups in mean levels of ethnocentrism, it is suggested that studies which attempt to show a difference in the degree of association between authoritarianism and ethnocentrism allow for the effect of differences in instrument variances, between cultural groups, on the measures used. (32 ref)—*Journal abstract.*

9366. Tomich, Alda K. (Bowling Green State U) **Alienation: A cross-cultural analysis.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 187-200.—Examined alienation in 136 Middle-Eastern and 150 American undergraduates, using a self-administered questionnaire. Results indicate that Ss from a transitional society expressed greater feelings of alienation; they felt more powerless and scored higher on the normlessness, meaninglessness, and social isolation scales. These relationships were not altered when socioeconomic status and sex were controlled, with 1 exception—American students with a professional background showed higher normlessness than Middle Eastern respondents of the same occupational level. The variability in results obtained within and across the cultural groups studied is

explained in terms of cultural context effects. (18 ref)—*Journal abstract.*

9367. von Fleckenstein, Fritz. (Australian National U, Port Moresby, New Guinea) **Are innovativeness scales useful?** *Rural Sociology*, 1974(Sum), Vol 39(2), 257-260.—Presents data which demonstrate the value of separate analyses of different adopted innovations. Farmers in northeastern Thailand were interviewed. Results suggest that the early adoption of one innovation did not generally correlate with early adoption of other innovations.

9368. Wiedler, D. Lawrence & Zimmerman, Don H. (U California, Santa Barbara) **Generational experience and the development of freak culture.** *Journal of Social Issues*, 1974, Vol 30(2), 137-161.—Discusses the emergence of "freak culture" within the present generation of middle-class youth and some of the implications of the freak value system and life style for societal change. An empirical description of freak culture is presented, based on ethnographic and survey data. The content of freak culture is related to distinctive generation-based experiences of middle-class youth born after World War II. Those who as students established their own residences discovered that they could be "real persons" independently of their families, while not having an occupational identity—a critical and novel discovery for middle-class males. Isolated from previous generations and ghettoized, some middle-class members of this generation undertook a self-transformation, and in the process formulated and lived out new conceptions of society which were consistent with their own distinctive experiences. (41 ref)—*Journal abstract.*

### Social Issues & Social Processes

9369. Arafat, Ibtihaj S. & Cotton, Wayne L. (City Coll, City U New York) **Masturbation practices of males and females.** *Journal of Sex Research*, 1974(Nov), Vol 10(4), 293-307.—Attempted to determine if there is any relationship between gender and masturbation practices with regard to frequency, cause, effect, regularity, feelings, and awareness. A questionnaire was administered to 435 university students. In both sexes most individuals begin masturbating between 9 and 16 yrs old. More females than males report a greater intensity of orgasm from masturbation than from intercourse. The immediate reasons for masturbating are similar for both sexes. Twice as many females as males report feeling depressed after masturbation. (18 ref)—*E. B. Jaffe.*

9370. Bauman, Karl E. & Wilson, Robert R. (U North Carolina, School of Public Health, Chapel Hill) **Sexual behavior of unmarried university students in 1968 and 1972.** *Journal of Sex Research*, 1974(Nov), Vol 10(4), 327-333.—Compares data from random samples of unmarried university students in 1968 and 1972. More coital experience was reported by both sexes in 1972.

9371. Boote, R. E. **Human environment and social welfare.** *Social Defence*, 1973(Jan), Vol 8(31), 6-17, 20.—Discusses the relationship between population numbers, economic growth, and expectations for life. It is noted that population limitation, economic limitation, and the development of new ethical standards are necessary if environmental health, planetary order, and distributive justice are to be preserved and conserved. It

is suggested that the new ethical standards should be based on integrity, humanity, determination, and judgment in order to maintain earth as a healthy place to live. Advances made at the 1972 United Nations World Conference in alerting world opinion to common environmental problems and interests are reported.—*A. de la Haba.*

9372. Brill, Norman Q. & Christie, Richard L. (U California, Medical School, Los Angeles) **Marihuana use and psychosocial adaptation: Follow-up study of a collegiate population.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 713-719.—A longitudinal study of a representative sample of 1,380 1970 college students disclosed that a great majority of students who had used marihuana reported "no effect" or "improved" adjustment in 1972, but a small group reported worsened adjustment and showed a clear trend to have decreased or quit the use of the drug. Many others who quit or reduced their use of marihuana, nevertheless reported its effects as favorable. No significant difference in grade point average or educational achievement was found between users and nonusers. Marihuana users experienced somewhat more difficulty in deciding on career goals and left college a little more often (than nonusers) to reassess their goals. Amotivational syndromes, if they occurred, were not observed in a large number of students who, despite using marihuana, were continuing to function satisfactorily.—*Journal abstract.*

9373. Bruvold, William H. (U California, School of Public Health, Berkeley) **Attitudes toward science and accompanying beliefs.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 269-274.—Used data collected in a statewide interview survey of California to assess current attitudes toward science and to assess the relationship between affective response toward science and beliefs about the contributions of science to modern life. Results from 972 participating respondents indicate that they exhibited very positive attitudes toward science. The study also demonstrated that attitudes toward science were related to beliefs about science in the manner predicted by earlier theoretical developments.—*Journal abstract.*

9374. Cangemi, Joseph P.; Laird, A. W. & Deeb, Norman A. (Western Kentucky U) **The philosophy of existentialism and a psychology of irreversible homosexuality.** *College Student Journal Monograph*, 1974(Sep-Oct), Vol 8(3, Pt 2), 12 p.—Suggests a causal relationship between early fear of the opposite sex and the incidence of homosexuality, in which the sex drive seeks outlet in sexual relations with persons of the same sex. The philosophy of existentialism holds that the essence of man is his existence and that his concern is with his present life. The individual's richest existence is to be what he can become. It is suggested that the fusion between existentialism and homosexuality has to do with this concept of man as an autonomous being. (47 ref) —*A. J. Ter Keurst.*

9375. Cassel, Russell N. & Zander, Gail. (U Wisconsin, Milwaukee) **Teach Me What I Want to Know About Drugs for junior high school students.** *International Journal of the Addictions*, 1974, Vol 9(4), 541-567.—Compared 271 7th, 8th and 9th graders to assess interest in different areas of drug-abuse information and

personal and social development. The Rotter Internal-External Control Scale (I-E) and the Ego Development Scale, measuring personal, social and educational development, and the Teach Me What I Want to Know about Drugs Questionnaire, measuring interest in 13 areas of drug-abuse information, were administered. Although there were no differences between grade levels on I-E scores, internally oriented Ss indicated a greater interest in drug-abuse information. Also, the higher the grade level the lower the interest in drug information, with differences in areas of interest at each grade level. The importance of basing educational programs on student interests and attitudes is discussed, and 3 computer-based programs based on these and other related results are referenced.—*F. Beyer.*

9376. Ciccone, Pasquale. (US Medical Ctr, Springfield, MO) **The federal government: Process and program.** In L. M. Irvine, T. B. Brelje (Eds), *Law, psychiatry and the mentally disordered offender*. I. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.—Describes federal statutes which regulate the medical, surgical, and psychiatric care provided for all persons charged with or convicted of a federal offense. Specific operations of the US Medical Center for Federal Prisoners in Missouri are described.

9377. Coates, Robert B. & Miller, Alden D. (Harvard U, Law School, Ctr for Criminal Justice) **Patrolmen and addicts: A study of police perception and police-citizen interaction.** *Journal of Police Science & Administration*, 1974(Sep), Vol 2(3), 308-321.—Presents part of a larger study of the effect of methadone treatment on crime careers of addicts, documenting (a) the extent of interaction between patrolmen and addicts; (b) police perceptions of drug-related crime, addicts, and drug treatment programs; and (c) problems in policing addicts. Participant observation, interviews, and questionnaires were used. Police viewed heroin addiction as a severe problem and as a reason for 50-75% of all crime, but there was very little interaction between addicts and police. 50% of police were opposed to drug treatment programs and all patrolmen felt such programs were ineffective. Constraints in the courts and the criminal justice system were seen as accounting for the low level of police-addict interaction.—*R. J. Albers.*

9378. Colew, Colin. **How to raise your child without threats or violence.** Hicksville, NY: Exposition, 1974. 104 p. \$7.50.—Explores child-rearing theories and techniques. Major topics include significant considerations in child discipline; the effect of a specific method of punishment on the child's future behavior; and brain imprinting and its effects.

9379. Cooke, Gerald; Pogany, Eric & Johnston, Norman G. (Norristown State Hosp, PA) **A comparison of blacks and whites committed for evaluation of competency to stand trial on criminal charges.** *Journal of Psychiatry & Law*, 1974(Fal), Vol 2(3), 319-337.—Evaluated 70 blacks and 70 whites referred to a center for forensic psychiatry to investigate whether differences in judgments of pathology of blacks and whites may be attributed to actual differences in those referred or to systematic biases in the judgment procedure. Ss were analyzed for characteristics associated with MMPI administration and for differences in MMPI profiles.

Results are consistent with previous literature and indicate a tendency to clinically overestimate psychopathology in blacks, though there was no supporting evidence for a difference in level of pathology in terms of the more objective MMPI measure.—*Journal abstract.*

9380. Culver, Charles M. & King, Francis W. (Dartmouth Coll, Medical School) **Neuropsychological assessment of undergraduate marihuana and LSD users.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 707-711.—Administered an extended battery of neuropsychological tests to 3 groups of 42 college seniors (LSD/mescaline users; marihuana/hashish users; and controls) who were matched on predrug usage intellectual and personality dimensions. The study was replicated 1 yr later. In the combined-years' analyses, the 3 groups showed statistically significant differences only on the Trail Making Test: LSD/mescaline users performed within normal limits but significantly worse than either of the other 2 groups. Since the 3 groups also differed significantly in the extent of their alcohol usage, a covariance analysis was carried out that indicated that this variable did not account for the LSD/mescaline group's performance on the Trail Making Test. (15 ref)—*Journal abstract.*

9381. Denber, Herman C. (U Louisville, Medical School) **Trials with drugs outside the United States.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 8-9.—Critiques national, state, and local laws in the US which make early clinical drug evaluations an almost impossible task. Drug studies in Switzerland of AHR 2277 (a butyrophenone) and 1766 CERM (an antidepressant) are reviewed. It is concluded that unless remedial action is taken immediately, US medical care will become 2nd class.

9382. Doob, Leonard W. (Yale U) **A Cyprus workshop: An exercise in intervention methodology.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 161-178.—Describes aborted efforts to conduct a workshop planned for Greek and Turkish Cypriotes on solving one or more of the problems that divided Cyprus into 2 isolated communities. It is suggested that the clinical and practical experience gained from the effort might be used in future enterprises.—*Journal abstract.*

9383. Drahn, Theodore L. (U Alaska) **Alcohol and working Americans.** *Industrial Gerontology*, 1974(Fal), NS, Vol 1(4), 1-19.—Reviews the literature on the increasing rise of alcohol use among working men and women. Responses generated from the evidence now available about the personal and societal cost that results are also discussed. (143 ref)

9384. Dynes, Russell R.; Quarantelli, E. L. & Ross, James L. (Ohio State U, Disaster Research Ctr) **Police perspectives and behavior in a campus disturbance.** *Journal of Police Science & Administration*, 1974(Sep), Vol 2(3), 344-351.—Reports on the Spring 1970 "riot" at Ohio State University from the police viewpoint, using questionnaire data from 499 policemen. Police perceived the situation as a real personal and group danger from a hostile, aggressive crowd requiring forceful control techniques. Social variables or differences in rank did not differentiate levels of this perception suggesting that the nature of the police occupation is a stronger influence on police behavior than personality or organi-

zational variables. Limitations of the study and recommendations regarding future research in this area are discussed. (20 ref)—*R. J. Albers.*

9385. Ember, Carol R. (Hunter Coll, City U New York) **Feminine task assignment and the social behavior of boys.** *Ethos*, 1973(Win), Vol 1(4), 424-439.—Studied the effects of feminine task assignments on the social behavior of Luo boys in Kenya. The egoistic, altruistic, and prosocial behavior of 28 Luo children ranging in age from 7.5 to 16 yrs was observed for a total of 135 minutes per child. Estimates of the amount of feminine work performed by each child were obtained from their mothers. It was found that boys exhibited more egoistic behavior than girls, and that girls showed a higher proportion of prosocial behavior than boys. Boys performing large amounts of feminine work inside the home were more feminine in their social behavior than other boys, but feminine work done outside the home did not result in feminized social behavior. It is concluded that differential task assignments are related to sex-linked differences in social behavior. (22 ref)—*J. Kelly.*

9386. Franti, Charles E.; Kraus, Jess F. & Borhani, Nemat O. (U California, School of Veterinary Medicine, Davis) **Pet ownership in a suburban-rural area of California, 1970.** *Public Health Reports*, 1974(Sep-Oct), Vol 89(5), 473-484.—Studied the relationship between pet ownership, demographic characteristics, and health for a sample of 1,091 central California households.

9387. Freed, Stanley A. (American Museum of Natural History, New York, NY) **Attitudes, behavior, and urban influences in a North Indian village.** *Annals of the New York Academy of Sciences*, 1974(Mar), Vol 220(6), 411-424.—Presents data concerning the effects of urbanization on 799 Indian villagers in the Union Territory of Delhi. The principal economic activity of the village is agriculture. 89 villagers were asked to fill out a 44-item questionnaire. Questions pertained to urban employment, work preferences, expectations for children's future work, preference for occupations, the nature and cost of religious and ceremonial events, best ways to serve God, and preferences for people among the community. Several themes emerged. The majority of men desired city jobs; reasons for this appeared to be primarily economic. Both men and women generally preferred to live in the village. No evidence of family breakdown or reduction in kinship ties was found, nor was there any evidence for the secularization of village life. It is concluded that all of the traditional village institutions will remain in full working order.—*R. S. Albin.*

9388. Friedman, Cornelia M.; Greenspan, Rhoda & Mittleman, Fay. (Boston Hosp for Women, MA) **The decision-making process and the outcome of therapeutic abortion.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1332-1337.—A review of the American literature on abortion suggests that an immediate negative response to abortion is not uncommon among women undergoing this procedure and that short-term unhappiness and guilt may be part of the normal response. The proportion of women with serious psychiatric complications is probably less than 10%. 4 case reports of postabortion psychiatric illness are presented that indicate (in agreement with the literature) that there

is high risk in abortion when any of the following elements is present: strong ambivalence, coercion, medical indication, concomitant severe psychiatric illness, and the woman's feeling that the decision was not her own. (25 ref)—*Journal abstract*.

9389. Galbraith, Gary G.; Strauss, Michael R.; Jordan-Viola, Eunice & Cross, Herbert. (Washington State U) **Social desirability ratings from males and females: A sexual item pool.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 909-910.—Administered the male and female forms of Thorne's Sex Inventory to 2 groups of 80 undergraduates who either rated the social desirability of a true response to each item or answered the items according to standard self-report instructions. Findings question the use of obvious-direct items with pathological import in sex behavior questionnaires.

9390. Girdano, Daniel A. & Girdano, Dorothy D. (U Maryland) **Drug usage trends among college students.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 94-96.—Presents data on drug usage during a 6-mo period in 1973 among 1,385 students at the University of Maryland. 87% of the Ss had used alcohol, 62% marijuana, 39% hashish, 20% methaqualone, 20% "speed" (amphetamines), and 13% tranquilizers.

9391. Goldschmidt, Jean; Gergen, Mary M.; Quigley, Karen & Gergen, Kenneth J. **The women's liberation movement: Attitudes and action.** *Journal of Personality*, 1974(Dec), Vol 42(4), 601-617.—Examines the women's liberation movement to gain systematic knowledge about the participants and thus learn the movement's practical implications as well as its implications for socio-activism. Ss were 448 undergraduate females from 4 educational settings: (a) a large, heterogeneous private urban university; (b) a small, suburban, academically elite coeducational college; (c) a Catholic women's college in a rural community; and (d) a small suburban women's college with moderate entrance standards. On a questionnaire containing 84 items and 2 personality scales, the issue of women's liberation was not introduced until the final section. Results indicate that in terms of family background, the women's liberation activist was not motivated by marital strife or by rebellion against values and attitudes espoused by her parents. Data do suggest that she was strongly motivated by professional aspirations and that those most active were talented women who had good reason to expect success under unbiased social conditions. In comparing women's liberation and other forms of activism, it appears that the movement is unique in important aspects. Parents' income, education and religion, the individual's own religious preferences, and aggressive tendencies were not related in the same way to liberation activism as they have been to antiwar and radical political protest. Women who were both least active and moderately active in the heterosexual realm were especially drawn to the movement. (21 ref)—P. O'Brien.

9392. Goldsmith, Alfredo & Goldberg, Rona J. (U North Carolina, International Fertility Research Program, Carolina Population Ctr, Chapel Hill) **Psychosocial aspects of vasectomy in Latin America.** *Journal of Sex Research*, 1974(Nov), Vol 10(4), 278-292.—Examines reasons for the paucity of vasectomy programs in

Latin America. Social constraints, family structure and the "machismo" cult are discussed. It is concluded that vasectomy programs could be successful if self-selection, screening, and counseling were employed. (42 ref)

9393. Greden, John F.; Frenkel, Sinai I. & Morgan, Donald W. (U Michigan, Medical Ctr, Neuropsychiatric Inst) **Alcohol use in the army: Patterns and associated behaviors.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 11-16.—Assessed by questionnaire the alcohol use of 1,873 US soldiers in the US and Vietnam. According to operational definitions based on total ethyl alcohol consumption and several behaviors associated with drinking, 7% were classed as alcoholics, 5% as borderline alcoholics, and 24% as potential alcoholics. Contrary to popular stereotypes, there was a disproportionate number of younger and lower ranking soldiers in these 3 groups; there was also a positive relationship between drinking and use of illicit drugs across groups. It is stated that future studies of alcohol use should include determinations of total ethyl alcohol intake to permit generalizability of results. (17 ref)—*Journal abstract*.

9394. Greenhouse, Phyllis & Rosenthal, Esther. (Brooklyn Coll, City U New York) **Attitudes toward women's right to self-determination.** *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 64-70.—223 women and 146 men, aged 18-50 yrs, were presented with 10 statements to test their attitudes toward women's right to self-determination. Results show that (a) younger Ss were more positive in attitude than older Ss and (b) women were more positive in attitude than men. The main issues of disagreement concerned women's careers, subordination of career to the home, and the decision to seek an abortion resting with the wife. Possible reasons for the recalcitrance to change on these issues are presented along with predictions of changes in families and child-rearing practices as young women become wives and mothers. (Spanish & French abstracts)—*Journal abstract*.

9395. Grenough, John L. (Pacemaker Planning, Louisville, KY) **Crime prevention: A new approach: Environmental psychology and criminal behavior.** *Journal of Police Science & Administration*, 1974(Sep), Vol 2(3), 339-343.—Discusses the environmental psychology approach to the prevention of criminal behavior. The concepts of environmental design, defensible space, and territoriality are applied to the problem of manipulating the environment to control criminal behavior.—R. J. Albers.

9396. Hayward, D. Geoffrey; Rothenberg, Marilyn & Beasley, Robert R. (Graduate School & University Ctr, City U New York) **Children's play and urban playground environments: A comparison of traditional, contemporary, and adventure playground types.** *Environment & Behavior*, 1974(Jun), Vol 6(2), 131-168.—Studied children's activities and interactions in 3 playgrounds: a traditional equipment playground, a contemporary-design playground, and an adventure playground (which supplies play material, not play equipment). Observation, interviews, behavioral mapping, and behavior setting records were employed. The playgrounds had different predominant user groups, different patterns of use of areas and equipment, and different roles for and participation by play setting

supervisors. Adults and preschoolers predominated at the traditional and contemporary playgrounds; 6-13 yr olds predominated at the adventure play area. At the 2 prebuilt playgrounds, use focused on the equipment, whereas at the adventure playground interactive play was common. The atmosphere of the playgrounds and the activities of users were shaped by a variety of factors, including opportunities and constraints of the physical environment, social influences, and freedom to make use of available opportunities. Information on users' choices and opinions relative to opportunities and freedom is presented, and implications for research and planning are discussed.—S. T. Margulis.

9397. Hollister, Leo E. (VA Hosp, Palo Alto, CA) **Psychotropic drugs and court competence.** In L. M. Irvine, T. B. Brelje (Eds.), *Law, psychiatry and the mentally disordered offender*. I. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.

9398. Illner, Michal & Foret, Miroslav. (Československá Akademie Věd, Ústav pro filosofii a sociologii, Prague, Czechoslovakia) [Social indicators and measuring the goals and effects of a social plan.] (Czech) *Sociologický Časopis*, 1974, Vol 10(1), 79-92.—Discusses the concept, function, construction, form, and source of social indicators. It is noted that they can fulfill either an analytical, normative, or evaluative function and that their construction should proceed from the Marxist conceptual model. The methodological goal is to combine dialectically their qualitative and quantitative aspects. Socioeconomic and statistical sociological investigations are the basic sources of information but the statistical practice in Czechoslovakia has not yet been sufficiently adapted to these purposes. Sociological investigation into social planning is advocated. (Russian & English summaries)—V. Fischmann.

9399. Irvine, L. M. & Brelje, T. B. (Eds.). (Illinois Security Hosp, Chester) *Law, psychiatry and the mentally disordered offender*. I. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.

9400. Jacobs, Keith W. (U Southern Mississippi) **Asthmador: A legal hallucinogen.** *International Journal of the Addictions*, 1974, Vol 9(4), 503-512.—Describes the physical and psychological effects of Asthmador abuse based on observations of 5 cases. A review of the literature on Asthmador is included.

9401. Jaffe, Yoram; Malamuth, Nell; Feingold, Joan & Feshbach, Seymour. (U California, Los Angeles) **Sexual arousal and behavioral aggression.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 759-764.—Investigated the effects of sexual arousal on behavioral aggression in 44 male and 47 female undergraduates. Half the Ss read erotic passages, whereas the other half read neutral passages. All Ss were then given the opportunity, as part of a bogus ESP task, to deliver electric shocks to an experimental confederate as punishment for incorrect responses. The gender of the aggressor (S), of the recipient of aggression (confederate), and of the E were also varied to yield a  $2 \times 2 \times 2 \times 2$  design. Sexually aroused males and females delivered more intense shocks than nonaroused Ss regardless of the gender of the confederate or E. Results strongly suggest a link between sex and aggression, but the relative contribution of sexual arousal vs

more general arousal mechanisms remains a question for future research. (18 ref)—*Journal abstract*.

9402. Jeffries, Vincent. (California State U, Northridge) **Political generations and the acceptance or rejection of nuclear warfare.** *Journal of Social Issues*, 1974, Vol 30(3), 119-136.—On the basis of historical events and the differing climates of public opinion pertaining to war, 3 political generations were discriminated: Dissent (born between 1943 and 1949), Cold War (born between 1927 and 1942), and World War II (born before 1927). Results of an attitudinal survey indicate differences between these generations on acceptance of nuclear warfare. (31 ref)

9403. Kandel, Denise. (New York State Dept of Mental Hygiene, Biometrics Research, New York) **Inter- and intragenerational influences on adolescent marijuana use.** *Journal of Social Issues*, 1974, Vol 30(2), 107-135.—To investigate inter- and intragenerational influences in adolescent marijuana use, a survey was undertaken on a representative sample of 8,206 public secondary school students in New York State. Independent data were obtained from adolescents, their parents, and their best-school-friends. Data document the crucial role which members of the same generation play in adolescent illegal drug use. Involvement with other drug-using adolescents was a more important correlate of adolescent marijuana use than was parental use of psychoactive drugs or alcohol (which provided a small influence). Inter- and intragenerational influences were synergistic, however. The highest rates of marijuana usage were observed among adolescents whose parents and best friends were drug users. Interactional generational factors influenced levels of intragenerational influences. (4 p ref)—*Journal abstract*.

9404. Kasschau, Patricia L.; Ransford, H. Edward & Bengtson, Vern L. (U Southern California) **Generational consciousness and youth movement participation: Contrasts in blue collar and white collar youth.** *Journal of Social Issues*, 1974, Vol 30(3), 69-94.—Notes that the spread of youth-group consciousness and counterculture behavior during the 1960s has been accounted for by 2 competing theoretical rationales: the "movement sweep" and the "blend" theses. The present study explored the development of youth stratum consciousness in 4 groups of 18-22 yr old youth: white collar and blue collar students and nonstudents ( $N = 287$ ). The research employed a social movement paradigm suggesting an explicit developmental sequence from initial awareness through crystallized ideology and behavior expression. The attempt to operationalize generational consciousness based on K. Mannheim's (1952) definition was partially successful. Data clearly provide little support for the "sweep" thesis of youth movement phenomena but do suggest some confirmation for the "blend" perspective. (59 ref)—*Journal abstract*.

9405. Katz, Daniel. (U Michigan) **Factors affecting social change: A social-psychological interpretation.** *Journal of Social Issues*, 1974, Vol 30(3), 159-180.—Considers that the concern of the psychologist with person-blame attribution has meant a failure to analyze types of change and social causes of societal changes. Social change can be radically structural (revolutionary), incrementally structural, or cultural. Sources of change

can be found in (a) internal contradictions within a society as in Marxian analysis, (b) uneven rates of growth of various parts of the system, (c) contact and clash with other systems, and (d) generational differences. Ongoing social systems are based upon a number of mechanisms designed to insure a continuing input so that effective forces of change need some accumulation and mobilization of social disaffection along group lines rather than the alienation of scattered individuals or transient subgroupings. It is argued that the basic contradictions in society have led to incremental rather than radical change. Generational differences have produced cultural rather than structural change. Thus, the divisiveness and rebellion stemming from differences in social class, age, sex, and race have not resulted in sharp deep lines of cleavage facilitative of revolutionary movements, but have been contained within the society. They may assume more significance, however, as the American system comes into increasing competition and conflict with other systems for resources, markets, and power. (16 ref)—*Journal abstract*.

9406. Keeler, Martin H. & Moore, Edward. (Medical U South Carolina) **Paranoid reactions while using marijuana.** *Diseases of the Nervous System*, 1974(Nov), Vol 35(11), 535-536.—Studied the percentage of 2 groups of marihuana users who had ever suspected that there would be a police raid or that their companions were playing some trick on them while using the drug. 138 undergraduates (all male) and 48 members of the counter-culture (60% male) were administered questionnaires. Results show that paranoid phenomena while using marihuana are common. About half the Ss suspected some trick on the part of their friends, with more frequent paranoid reactions among the counter-culture group.—*R. S. Albin*.

9407. Kessler, Kenneth & Weiss, Theodore. (Psychiatric Inst, Washington, DC) **Ward staff problems with abortions.** *International Journal of Psychiatry in Medicine*, 1974(Spring), Vol 5(2), 97-103.—Describes a 1-yr experience in dealing with the staff problems—primarily in nursing—created by performing abortions in a university hospital. Problem areas are highlighted and recommendations for dealing with these are offered.—*R. M. Cohen*.

9408. Kessler, Marc & Gomberg, Christopher. (U Vermont) **Observations of barroom drinking: Methodology and preliminary results.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1392-1396.—Observed the behavior and drinking patterns of 53 men in 15 bars in a New England city between 9 PM and 2 AM on Wednesday, Thursday, Friday, and Saturday nights. Most of the men (62%) had 1 or 2 drinks; only 1 had more than 6, and 66% spent an hour or less in the bars. More men drank with others than alone (74 vs 26%); there were no differences between the groups in how long they stayed or how much they drank; most finished their drink in 20 min. Number of sips per drink did not vary greatly between drinks or type of bars. Beer was preferred by 68%, highballs by 24%, and cocktails by 5%. It is concluded that a number of barroom and drinking behaviors can be studied without disrupting on-going barroom activities.—*Journal abstract*.

9409. Kilwein, John H.; St Denis, Gerald C. & Hall, William T. (U Pittsburgh, School of Pharmacy) **The**

**social class of young adults and their views on the environment: "How much would you sacrifice?"** *Journal of School Health*, 1974(Apr), Vol 44(4), 196-197.—Obtained questionnaire data from 865 high school seniors balanced to represent middle-class and working-class backgrounds. Over 90% of the students from each social class and area of residence evaluated the environmental situation as serious. In addition, Ss were asked to indicate their willingness to (a) use fewer electrical appliances, (b) limit children to 2 or less, (c) reduce car use by 50%, (d) pay more taxes to clean up the environment, and (e) check on the contents of foods eaten. Results show that only 47.6% of the participants were willing to reduce the use of electrical appliances while 60.9% were willing to limit the number of children to 2 or less. Willingness to take these suggested actions decreased as social class decreased. Furthermore, there was a strong reluctance on the part of the total group to reduce use of the automobile. It is suggested that students do not fully realize the need for individual acts combined with governmental programs to alleviate the current environmental and energy crisis.—*R. S. Albin*.

9410. Kleiter, G. D.; Miribung, J. & Perrez, M. (U Salzburg, Psychologisches Inst, Austria) **Drug abuse among high school and vocational school students in a small city.** [Germ] *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1974(Jan), Vol 22(2), 161-168.—Administered a drug-abuse questionnaire (see R. Zimmermann; PA, Vol 53:Issue 5), previously administered to Essen, West Germany, high school students to 972 high school students in Salzburg, Austria, to compare the incidence of drug abuse in the 2 cities. Results show a similar frequency of drug abuse, but percentages were considerably higher for vocational students. This is attributed to the fact that vocational students live apart from their families. Correlations were found between drug abuse and cigarette smoking, contact with friends, school information about drugs, free time activities, home conditions, and other factors.—*S. D. Babcock*.

9411. Knox, Wilma J. (VA Ctr, Biloxi, MS) **Attitudes of psychology graduate students toward drug abuse.** *Professional Psychology*, 1974(May), Vol 5(2), 185-190.—Administered an opinion questionnaire on attitudes toward drug abuse to 262 Veterans Administration psychology trainees. Most of the 174 respondents reported little or no experience with drug abusers. A regular user of heroin, amphetamines, barbituates, cocaine, or LSD was considered to be a drug abuser by 80% or more of the respondents, whereas only 21.8% identified a regular user of marijuana with drug abuse. The pattern of the responses indicated a high regard for personal freedom. Outpatient treatment and open-ward care within a neuropsychiatric hospital were the preferred treatment environments, and fewer than 5% of the respondents supported court probation, jail term, or tranquilizing medication as preferred treatment modalities. A willingness to undertake full-time work with drug abusers was expressed by 44.3%, and 23.6% were definitely unwilling to do so.—*B. Lindsey*.

9412. Kolb, Douglas; Gunderson, E. K. & Nail, Richard L. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **Perceptions of drug abuse risks in relation to type of drug used and level of experience.**

*Journal of Community Psychology*, 1974(Oct), Vol 2(4), 380-389.—Investigated perceptions of risks involved with specific drugs, using as Ss 998 US Navy enlisted men in a drug rehabilitation center. Ss typically were 20-23 yrs old, Caucasian, and multiple drug users who had been involved with drugs for about 2-4 yrs. A list of 39 possible social, psychiatric, and medical risks were presented to Ss. Results show high frequencies with which risks were attributed to opiates, hallucinogens, amphetamines, and barbituates, particularly by heavy users of these drugs, and a high degree of specificity of risks in relation to drug type. Most of the Ss considered use of certain drugs to be risky, and their perceptions of specific adverse effects were generally consistent with those of professional investigators. (17 ref)—P. O'Brien.

9413. Laufer, Robert S. & Bengtson, Vern L. (Brooklyn Coll, City U New York) **Generations, aging, and social stratification: On the development of generational units.** *Journal of Social Issues*, 1974, Vol 30(3), 181-205.—Discusses methods for exploring the antecedent of generation unit formation among upper middle-class youth of the past decade. 4 types of generational units among youth are delineated—radicalism, freakism, communalism, and revivalism—and the possibility of generational units among the elderly is discussed. (59 ref)

9414. Loo, Chalsa M. (Ed.). (U California, Santa Cruz) **Crowding and behavior.** New York, NY: MSS Information Corp, 1974. 245 p. \$6.25.—Includes discussions on the effect of population and urbanization on crowding behavior and articles which cover theoretical, empirical, and anthropological approaches to understanding the phenomenon.

9415. LoPiccolo, Joseph & Stegar, Jeffrey C. (State U New York, Stony Brook) **The Sexual Interaction Inventory: A new instrument for assessment of sexual dysfunction.** *Archives of Sexual Behavior*, 1974(Nov), Vol 3(6), 585-595.—Describes a paper-and-pencil self-report inventory for assessing the sexual adjustment and sexual satisfaction of heterosexual couples, the Sexual Interaction Inventory (SII). The SII consists of a list of 17 heterosexual behaviors; for each behavior, both husband and wife separately answer 6 questions using a 6-point rating scale with verbal labels relating to the frequency of the behavior. Responses from each partner are summed across all 17 behaviors, and these totals are used to derive an 11-scale profile. To test the reliability and validity of the SII, it was administered to 4 samples with a total of 191 couples. Test-retest reliability (2 wks) coefficients for the 11 scales ranged from .652 to .902 ( $p < .05$ ). Internal consistency coefficients were adequate, but convergent validity measures indicate that the traits measured by each scale separately did not bear strong relationships to global self-ratings of sexual satisfaction. Scores of 28 sexually dysfunctional couples indicated that 9 of the 11 SII scales discriminated client applicants from sexually satisfied couples. All 11 scales were reactive to treatment. (23 ref)—L. Gorsey.

9416. Lumsden, L. P. (Public Service Board, Psychological Services Branch, Papua New Guinea) **Women in agriculture.** *New Guinea Psychologist*, 1974(Aug), Vol 6(2), 45-49.—Discusses the supply, training, and requisite skills of agricultural teachers and extension officers in Papua New Guinea, stressing the need for full

utilization of the potential of women in rural agricultural programs. It is noted that personnel trained outside of their villages often become alienated and are not well-received by village farmers. It is suggested that women in these positions would be more successful with the primarily female subsistence farmers. Successful training and utilization of women in these positions in seen as a means to increase the status of women in Papua New Guinea as well as to educate women farmers.—C. Wright.

9417. Maccoby, Eleanor E. & Jacklin, Carol N. (Stanford U) **The psychology of sex differences.** Stanford, CA: Stanford University Press, 1974. xiii, 634 p. \$18.95.—Discusses the development of sexual behavior on the basis of the theory that psychological sex differentiation occurs through imitation, praise or discouragement, and self-socialization. The validity of some of the most widely held beliefs about sex differences is assessed.

9418. Maday, Bela C. (NIMH, Bethesda, MD) **Urbanization and the vanishing peasantry in Hungary.** *Annals of the New York Academy of Sciences*, 1974(Mar), Vol 220(6), 560-568.—Discusses reasons for the disappearance of the peasant way of life in Hungary. Historical perspectives on the problem, the single family homestead system (tanya), migration to the industrialized cities, and urbanization of the villages themselves are described.

9419. Mann, Jay et al. (U California, Medical Ctr, San Francisco) **Satiation of the transient stimulating effect of erotic films.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 729-735.—Reanalyzed data from a 1971 study by J. Mann et al which showed either erotic films or nonsexual movies 1 time/wk for 1 mo to 85 married couples (age range, 30-64 yrs) and found that the sex films had stimulated a relatively high level of sexual activity on movie-viewing nights. There was no evidence that the sex movies had produced a "disinhibition" effect or had brought about new learning. Rather, the film had apparently activated previously acquired sexual habits which then became dormant again with the passage of time. As a further test of this stimulus-response analysis, the possibility that there was a satiation effect with repeated exposure to the erotic films was studied. Findings indicate that these movies had become less and less effective elicitors of sexual reactions with the successive presentations, which supports the appropriateness of the stimulus-response analysis.—*Journal abstract.*

9420. Mehrabian, Albert & Russell, James A. (U California, Los Angeles) **A verbal measure of information rate for studies in environmental psychology.** *Environment & Behavior*, 1974(Jun), Vol 6(2), 233-252.—The information rate from a stimulus is a correlate of the arousal elicited by it. To develop a convenient, verbal measure of information rate, 214 undergraduates rated 6 verbal descriptions using 21 paired-adjective scales. In addition, measures of the pleasure, arousal, and dominance elicited by each description were obtained. Following data reduction and the elimination of items with an evaluative bias (i.e., associated with pleasure reactions), a 14-item scale remained whose items were significantly associated with arousal but not with

pleasure or dominance reactions. The association of scale items with arousal was cross-validated in a 2nd study employing photographic slides as targets. Findings indicate the construct validity of the scale through the information rate/arousal hypothesis. The 2nd study also provided reliability information about the scale. It is concluded that the measure should be helpful in assessing information rate of situations across many modes of presentation. (49 ref)—*S. T. Margulis.*

9421. Merlis, Sidney. (Central Islip State Hosp, NY) **Problems and experiences with drug trials outside the United States: The time lag in new drug availability.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 5-7.—Discusses the restrictions placed on new drug research and usage in the US relative to clinical trials done abroad. Current practices stemming from Federal Drug Administration interpretation of laws enacted in 1938 and 1962 are criticized because of the limitations they place on the way in which drugs in the US must be manufactured, shipped, labeled, and administered.

9422. Moll, Kendall. (Stanford Research Inst, Menlo Park, CA) **International conflict as a decision system.** *Journal of Conflict Resolution*, 1974(Dec), Vol 18(4), 555-577.—Discusses the decision system that combines a behavioral decision-making approach with a quantitative systems theory. Several hypotheses about how the British Navy budget was decided over a 70-yr period before World Wars I and II are proposed and quantitatively verified to illustrate the decision system. (29 ref)

9423. Morris, Norval. (U Chicago, Ctr for the Study of Criminal Justice) **The criminal justice system and psychiatry: Past, present, and future.** In L. M. Irvine, T. B. Brejle (Eds), *Law, psychiatry and the mentally disordered offender: I*. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.

9424. Muller, Charlotte & Schoenberg, Mark. (City U New York, Ctr for Social Research Graduate Ctr) **Insurance for mental health: A viewpoint on its scope.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 871-878.—Considers that insurance, although important as a finance source for certain subsets of mental health services, plays a restricted role in the financing of their aggregate costs and the delivery of care to low-income groups. The present level of insurance reflects the location of initiative and leverage within the health care market and the trade-off of economic interests involving professionals, consumers, carriers, and employers. Various methods of cost control, a prerequisite in any insurance program, differ as to expected mechanisms of action, side effects, and power. A consumer-oriented insurance system must deal with problems of quality control related to competing conceptual models governing therapy today. (23 ref)—*Journal abstract.*

9425. Nemeth, Charlan & Wachtler, Joel. (U Virginia) **Creating the perceptions of consistency and confidence: A necessary condition for minority influence.** *Sociometry*, 1974(Dec), Vol 37(4), 529-540.—Suggested that uniformity in small groups could be achieved by the majority moving towards the minority conception, as well as the reverse. It was hypothesized that actions and behavioral styles which foster perceptions of consistency and confidence aid the minority in its influence attempts. Relating this to the literature that links occupation of the

head seat at a rectangular table to influence, it was hypothesized that it is the act of choosing the head seat that fosters influence, not its simple occupation. Thus, (a) a minority of one who consistently takes a very deviant position would be able to influence a majority, particularly if he chooses the head seat rather than simply occupying it and (b) this same individual would be more effective if he chooses the head seat than if he chooses a side seat. Data from 116 male undergraduates confirm these hypotheses.—*Journal abstract.*

9426. Nishida, Hirohumi et al. (Kuramitsu Hosp, Kyushu, Japan) **[On the deliberate inhalation of organic solvents (glue sniffing) which spread in a junior high school.]** (Japn) *Kyushu Neuro-psychiatry*, 1973(Dec), Vol 19(3-4), 219-223.—Reports results of (a) medical and psychological examinations of 7 male and 5 female habitual glue sniffers and (b) a questionnaire survey of 464 students in a junior high school. Changes of feeling and perceptual disorders were the major symptoms of acute poisoning from organic solvents. Other symptoms were lassitude and passivity, a drop in school grades, increased truancy from school and home, and increased lying. Questionnaire results show that attitudes about life were important initial motives for glue sniffing, that there was a high correlation between the age of the student and the frequency of sniffing, and that pressure from teachers and other students contributed to a decrease in sniffing. (English summary)—*S. Ashida.*

9427. Orford, Jim; Waller, Seta & Peto, Julian. **Drinking behavior and attitudes and their correlates among university students in England: I. Principal components in the drinking domain: II. Personality and social influences: III. Sex differences.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1316-1374.—Administered a questionnaire on drinking behavior and attitudes to a total of 1,323 English undergraduates. A factor analysis of responses revealed 2 major factors: (a) one which accounted for 40% of the total variance and was related to a general involvement with and appreciation of alcoholic beverages and (b) one which accounted for 8-10% of the variance and involved an interest in drinking *per se* vs drinking for psychological effects. No separate "problem drinking" component emerged. Scores from the Eysenck Personality Inventory, a specially constructed Adventurous-Pleasure-Seeking Scale, Eysenck's Social Attitude Inventory (measuring radicalism-conservatism and tender-tough-mindedness), and measures of quantity and frequency of drinking by parents and friends and approval of drinking by parents were found to be correlated with the 2 above factors. Significant sex differences were found in the amount and frequency of drinking, social settings for drinking, and alcohol-related behaviors. It is suggested that as many women as men may be motivated to drink for the mood-modifying effects of alcohol and have experienced these effects. (95 ref)—*Journal abstract.*

9428. Osmond, Humphry; Franks, Violet & Burtie, Vasanti. **Changing views of women and therapeutic approaches: Some historical considerations.** In V. Franks & V. Burtie (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

9429. Peterson, George L. (Northwestern U) **Evaluating the quality of the wilderness environment: Congruence between perception and aspiration.** *Environment & Behavior*, 1974(Jun), Vol 6(2), 169-193.—Proposes and demonstrates a method for evaluating the quality of the wilderness environment from the viewpoint of the recreational user. In the proposed method, psychological inventories are used to measure aspirations for and perceptions of specific details of the wilderness experience and to quantitatively compare aspirations and perceptions in terms of detailed environmental conditions and experiences. The quantitative comparisons allowed the development of an overall index of quality (satisfaction) and permitted the identification of specific environmental sources of satisfaction and dissatisfaction as well as measures of the relative contribution of each. This is potentially useful to the wilderness manager, because it explains the reasons for a given level of performance in terms that can be translated into management decisions. Data collected in the Boundary Waters Canoe Areas of the Superior National Forest were used to illustrate the technique. Although the wilderness environment is emphasized, the method is regarded as applicable in concept to a wide range of environmental situations.—S. T. Margulis.

9430. Rappeport, Jonas R. (Medical Service of the Supreme Bench of Baltimore, MD) **The psychiatrist as a friend of the court.** In L. M. Irvine, T. B. Brelje (Eds), *Law, psychiatry and the mentally disordered offender: I*. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.

9431. Ratliffe, Bruce E. & Helsten, Carmen. **Street drug analysis as an adjunct to emergency medical care at rock concerts.** *PharmChem Newsletter*, 1974, Vol 3(7), 1, 3.—Describes the process and results of drug analysis as an adjunct to emergency medical services at a weekend rock concert in California in the summer of 1974. Results of analyzing 46 drug samples show that nearly all tetrahydrocannabinol, mescaline, and psilocybin samples contained LSD and/or parachlorophenylamine; that marihuana was nearly always pure; and that LSD dosages were well below those advertised in selling.

9432. Rless, Bernard F. (Postgraduate Ctr for Mental Health, New York, NY) **New viewpoints on the female homosexual.** In V. Franks & V. Burtle (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

9433. Ritzel, Günther. (U Göttingen, Psychiatrische Klinik und Poliklinik, W Germany) **[History and present state of psychiatric research into vagrancy.]** (Germ) *Psychiatria Clinica*, 1974, Vol 7(1), 26-49.—Discusses the frequency and forms of vagrancy. Following a historical review, the results of psychiatric research into vagrancy conducted in the German-speaking world since the beginning of the 20th century are described against the background of the overall development of the discipline of psychiatry. The present state of knowledge of cause and origin of vagrancy is reported with special reference to social causes. (112 ref)—*English summary*.

9434. Roško, Róbert. (Slovenská Akadémia Vied, Bratislava, Czechoslovakia) **[Methodological questions in studying the intelligentsia.]** (Slov) *Sociologický časopis*, 1974, Vol 10(1), 23-32.—Deplores the fact that

Marxist authors continue to differ about the definition of the intelligentsia and its position in the structural system of society. The orthodox Marxist position represented by Lenin is defended. The opinion that the intelligentsia, being defined by a professional variable, constitutes a group outside social classes, is seen as an idea of a petty bourgeois intellectual in capitalism who does not distinguish between class groups and professional groups. (Russian & English summaries) (19 ref)

9435. Scoullar, Brian B. **A note on some research into agricultural extension methods.** *New Guinea Psychologist*, 1974(Aug), Vol 6(2), 53-55.—Studied 14 successful and 14 unsuccessful rural development programs in the Papua New Guinea Highlands to determine criteria that contributed to success. Goal orientation related to group prestige and individual status and income accounted for 41.5% of the variance and traditional vs alien sanctions for 7%. It is concluded that the locality group is the basic unit in this area and that internal and external competition consistent with maintaining within-group obligations will be inevitable factors of programs in this part of New Guinea. A study in progress attempting to differentiate characteristics of high vs low producing individuals is described. C. Wright.

9436. Settle, Russell. (Menninger Foundation, Topeka, KS) **The state government: Process and program.** In L. M. Irvine, T. B. Brelje (Eds), *Law, psychiatry and the mentally disordered offender: I*. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.—Discusses the generally inadequate attempts by states to deal with the mentally disturbed criminal offender. It is argued that the traditional separation of the mentally disturbed offender from other groups is not in the best interest of either the offender or society, and that a more realistic approach would be to uniformly administer the cases of all persons coming into contact with the criminal justice system. New Kansas statutes which represent some forward steps in this area are described.

9437. Shelley, R. L. (Capricornia Inst of Advanced Education, Rockhampton, Papua New Guinea) **Attitudes of educated Papua New Guineans to contemporary political issues: A note on the influence of church and Western contact.** *New Guinea Psychologist*, 1974(Aug), Vol 6(2), 78-83.—Administered a questionnaire to study the attitudes of 511 high school seniors from 4 districts of Papua New Guinea toward the government. Testing took place 6 mo before self-government was implemented. Variables included length of contact with European or Western ideas and government vs church or mission schools. Ss in mission schools had significantly more favorable attitudes toward the government, although government school Ss' attitudes were also generally favorable. Degree of development was not related to favorableness of opinion. It is noted that further analyses of the data are in progress and may lead to stronger conclusions.—C. Wright.

9438. Starosta, William J. (U Virginia) **The use of traditional entertainment forms to stimulate social change.** *Quarterly Journal of Speech*, 1974(Oct), Vol 60(3), 306-312.—Proposes that mass media (radio, television, cinema, newspaper) are not particularly effective in facilitating social change in transitional

societies. In those societies, traditional entertainment media—story-telling, folk drama, puppet shows, dance forms, and religious ceremonies—are more likely to prove effective.

9439. Starr, Jerold M. (U Pennsylvania) **The peace and love generation: Changing attitudes toward sex and violence among college youth.** *Journal of Social Issues*, 1974, Vol 30(2), 73-106.—Notes that the period of the 1960s marked the emergence of a distinctive generational ideology among a substantial segment of American youth. This "peace and love" ideology featured a high degree of age-group consciousness and unique integration of life-style and political concerns, the psychological foundation for which was laid by the increased differentiation of age roles and de-differentiation of sex roles associated with advanced industrial development. The expansion of higher education, emergence of the multi-billion dollar youth market, and growth of the mass media provided the means by which many such youth were able to achieve consciousness of their common interests and join active generation units with distinctive styles of expression. The war in Indochina constituted the traumatic episode which differentiated the various age groups in America and galvanized the middle class, college segment of the youth cohort into action. action. (4½ p ref)—*Journal abstract*.

9440. Sternbach, Oscar. (Private practice, New York, NY) **The pursuit of happiness and the epidemic of depression.** *Psychoanalytic Review*, 1974(Sum), Vol 61(2), 283-293.—The goals of the Declaration of Independence—life, liberty, and the pursuit of happiness—are interpreted as expressing infantile impulse gratifications that generate depression, violence, and social problems.

9441. Strang, Heinz. (Lehrstuhl für Sozialpädagogik, Hannover, W Germany) [The current situation of the family in our society.] (Germ) *Heilpädagogik*, 1974(Mar), Vol 43(1), 3-10.—Descriptions of the contemporary family in current literature show great discrepancies as to its structure and function. The question of whether the traditional family contributes to the stability of its members is often discussed. New perspectives lead to a greater variety of views regarding the nature and function of the family. National policy determines to some extent how a family pursues its goals: in a Marxist society the family will follow Marxist social patterns; in a capitalist society the family will follow capitalist patterns. Social unrest caused by political changes is leading to disorganization of the small family. Families threatened by social unrest must be strengthened by professional assistance if the family is to be preserved. (22 ref)—C. D. Bauer.

9442. Strimbu, Jerry L. & Sims, O. Suthern. (National Bank of Detroit, MI) **A university system drug profile.** *International Journal of the Addictions*, 1974, Vol 9(4), 569-583.—Administered a questionnaire to 24,609 university students using a maximum saturation survey technique, in order to assess patterns of drug use, attitudes toward drug use, and demographic variables related to drug use. Results indicate the 3 most frequently used drugs are alcohol (46.3%), tobacco (26.3%), and marihuana (15.5%). The most striking finding concerning attitudes was that both users and nonusers emphasized the social and individual aspects of

drug use rather than legal or moral aspects. A profile of a typical university drug user was constructed, based on 9 personal background variables and 2 student status variables. A discussion of the study's advantages over other surveys of college drug use is included. (20 ref)—F. Beyer.

9443. Sue, Stanley; Smith, Ronald E. & Gilbert, Renee. (U Washington) **Biasing effects of pretrial publicity on judicial decisions.** *Journal of Criminal Justice*, 1974(Sum), Vol 2(2), 163-171.—In a 4-factor design, the effects on judicial decisions of sample (102 undergraduates vs 100 nonstudents over 18 yrs of age), sex of S. pretrial publicity (damaging and relevant vs irrelevant), and judge's instructions (warning to disregard pretrial publicity vs a neutral statement) were examined. Results indicate that sample and judge's instructions had no effects on verdicts, recommendations for sentencing, or ratings of the strength of the prosecution and defense's cases. Pretrial publicity, however, exerted a strong influence defense's verdicts and ratings of the prosecution's case, particularly among females. It is suggested that pretrial publicity may serve to affect evaluations of the evidence presented at the trial.—*Journal abstract*.

9444. Thomas, L. Eugene. (U Connecticut) **Generational discontinuity in beliefs: An exploration of the generation gap.** *Journal of Social Issues*, 1974, Vol 30(3), 1-22.—Data from college students and their parents indicate striking generational differences on a measure of time perspective. Results suggest that arguments that a counterculture is emerging among youth concentrate on the value orientation level, while the debunkers of the notion of a generation gap focus almost entirely upon level of attitudes. (47 ref)

9445. Thomas, Mrs Howell. **Prostitution in Great Britain today.** *Social Defence*, 1972(Oct), Vol 8(30), 14-26.—Presents arguments for changing the law relating to sexual offenses. Past laws, present legislation, and suggestions for effecting change are described.

9446. Tift, Larry L. (U Illinois, Chicago Circle) **The "cop personality" reconsidered.** *Journal of Police Science & Administration*, 1974(Sep), Vol 2(3), 266-278.—Tested the hypothesis that "working personalities" of police develop from task-related values and attitudes created by specialized roles rather than from selection factors or personality traits. Participant observations and interviews of police-citizen interactions were conducted in 5 police units performing different tasks. 5 environment variables were differentially important to each of the police units. Attitudes toward citizens were documented by police district, race, and organizational unit with all variables found to interact. Results show that unit or task-specific attitudes were dominant in citizen-police encounters. (18 ref)—R. J. Albers.

9447. Tognacci, Louis N. & Cook, Stuart W. (U Colorado) **Conditioned autonomic responses as bidirectional indicators of racial attitude.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 137-144.—Present physiological techniques of attitude measurement tap attitude intensity but not attitude direction. An alternative physiological technique, based upon the phenomenon of semantic generalization of conditioned autonomic responses, was tested to determine whether it

would provide a bidirectional indicator of attitude. 24 white undergraduates with favorable or unfavorable self-reported attitudes toward blacks were conditioned to statements having no racial content which they had previously evaluated as "bad." Subsequently, they were presented with statements with racial content; the latter were sentences which would be differentially evaluated as "good" or "bad" by persons with dissimilar racial attitudes. It was hypothesized that racial attitude would predict conditioned autonomic responses elicited by the generalization statements. Groups differing in racial attitude could be distinguished on the basis of their conditioned responses to the race-related generalization statements. (20 ref)—*Journal abstract*.

9448. Tuteur, Werner. (Elgin State Hosp, IL) **The Chicago Eleven trial and its psychiatric implications.** In L. M. Irvine, T. B. Brelje (Eds), *Law, psychiatry and the mentally disordered offender: I*. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.

9449. Vinod, Mahendra C. (Fiji Coll of Agriculture, Nausori) **Agricultural education for women.** *New Guinea Psychologist*, 1974(Aug), Vol 6(2), 50-52.—Suggests that women should play a major part in rural agricultural programs in developing countries. Women are considered suitable agricultural extension officers in Papua New Guinea because they can comfortably approach other women, who can then influence their husbands to adopt new procedures. Feminine characteristics of patience and respectfulness are seen as potentially useful with farmers, who are often resistant to change. It is suggested that course content in training be guided by local needs and objectives.—*C. Wright*.

9450. Vista Hill Psychiatric Foundation. (San Diego, CA) **Drug X: The most dangerous drug on earth.** *Drug Abuse & Alcoholism Newsletter*, 1974(Oct), Vol 3(7), 1-4.—Describes the statistics on alcohol abuse, citing data concerning (a) the 10,000,000 Americans who are dependent upon alcohol, with its usage by them out of control; (b) the several-hour length of the intoxication state it produces; (c) the 25,000 traffic deaths that are associated with alcohol ingestion; (d) the 35-50% of all arrests and 50% of all rapes committed while the offender is under the influence of alcohol; (e) the suicide rate among alcoholics which is 6-20 times higher than in the general population; (f) the family problems, including separations, divorces, and desertions that result either directly or indirectly from alcohol abuse; (g) the economic loss to industry in days absent from work and sick leave and compensation benefits; (h) the brain damage, eventually irreversible, that comes from alcoholism; (i) the tension and depression that accompany it; and (j) alcohol as the first step in the ladder to misuse of more harmful drugs. Factors responsible for the high rate of alcohol abuse in this country are discussed, and recommendations are made for resolution of the problem.—*R. S. Albin*.

9451. Vogel-Sprott, M. (U Waterloo, Ontario, Canada) **Defining "light" and "heavy" social drinking: Research implications and hypotheses.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1388-1392.—Obtained data on drinking from 131 18-67 yr old men. S's mean "typical" dose of alcohol was estimated from the percentage of absolute alcohol in his

customary beverage times the amount drunk on each occasion. The mean typical dose was .924 ml/kg, and the mean frequency of drinking was 2.46 times/wk. Dose and frequency were significantly related to age. It is suggested that construction of age norms on dose and frequency could help to provide an empirical definition of light and heavy social drinking, to chart changes in social drinking over time, and to provide a means of identifying deviant and possibly "prealcoholic" drinkers.—*Journal abstract*.

9452. Wainer, Howard. (U Chicago) **Predicting the outcome of the Senate trial of Richard M. Nixon.** *Behavioral Science*, 1974(Nov), Vol 19(6), 404-406.—Tested a prediction model for individual voting behavior in the US Senate. A prediction is made about the results of the impeachment trial of Richard M. Nixon.

9453. Wilkinson, Kenneth P. (Pennsylvania State U) **A behavioral approach to measurement and analysis of community field structure.** *Rural Sociology*, 1974(Sum), Vol 39(2), 247-256.—Discusses procedures that could be used as behavioral indicators of community action. Actors and roles are identified based on a 5-phase model: awareness, organization, decision, resource mobility, and resource allocation. The procedures described should provide means for further explication of community field structure.

9454. Wilson, Harriett. **Parenting in poverty.** *British Journal of Social Work*, 1974(Fal), Vol 4(3), 241-254.—Considers that middle-class child-centered behavior, as defined by J. Newson and E. Newson, is not operable in the milieu of poverty. Recent studies completed in England are cited which show that material shortages in the home and poor environmental conditions greatly affect parental child-rearing methods. An alternative model of child-centeredness applicable to the culture of poverty is proposed, and a group of families who share a relatively happy home atmosphere and enjoy participating in children's activities is identified, although it is pointed out that this type of family does not always prevent delinquency. Effective methods of delinquency prevention are shown not to be related to family cohesiveness. It is suggested that the current controversy over preparations for parenthood should acknowledge the realities of slum life which force parents to use child-rearing methods they in fact do not approve of. A more appropriate population for education in parenthood would be a socially upwardly mobile one. It is concluded that parents and children in the slums need vast financial resources to improve their conditions before an attempt is made to change their attitudes.—*Journal abstract*.

9455. Winslow, Jens J. (Bronchitis Screening Ctr, Aalborg, Denmark) **Drug use and social integration.** *International Journal of the Addictions*, 1974, Vol 9(4), 531-540.—Administered a questionnaire to 251 Danish 9th graders to test the "diffusion approach" and "subculture theory" of drug use. According to the diffusion approach, drug users are considered innovators or introducers, while the subculture theory views drug users as deviants. Questions concerning hash use, categorizing respondents as users, triers, or nontriers; and questions concerning sociometry, categorizing respondents on "interaction," "like best" and "leadership"

dimensions, were analyzed. Although results do not lend support to either hypothesis, both approaches are still considered valuable in the study of nonmedical drug use. Problems involved with the reliability of drug studies are indicated.—F. Beyer.

9456. Young, R. E.; Schubert, E. & Jacka, M. (Monash U, Clayton, Vic, Australia) **Hopes and fears in Papua New Guinea 1972-73: A pilot study.** *New Guinea Psychologist*, 1974(Aug), Vol 6(2), 56-62.—Used an open-ended interview approach to study hopes and fears of 404 male and 144 female Papua New Guineans prior to the country's attaining self-government. Interviews were conducted by trained college students in their home villages. The volume and range of concerns were found to be similar to those of people in other countries. Results indicate a high level of concern with economic development and with potential disunity and violence. A concern with the possibility of unwanted changes in family life also appeared, and it is suggested that welfare policies be developed to cope with this concern. It is concluded that these individual concerns reflect the issues of self-government and that the government should respond appropriately to them by controlling violence and other social problems.—C. Wright.

9457. Zimmermann, Robert. [Drug abuse by high school students in a large city.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1974(Jan), Vol 22(2), 169-179.—Reports on a survey undertaken at several high schools in Essen, West Germany, in 1968-1971. Frequency of drug abuse among students was less than expected. Only a few significant differences occurred between users and nonusers. Among the user group relations with parents were more tense, social achievement and motivation were lower, interests tended to focus on literature and music, and leisure activities were more sociable. The socialization was with their age peers and was satisfactory, but not intense emotionally. Hashish was the principal drug used.—S. D. Babcock.

## SOCIAL BEHAVIOR AND INTERPERSONAL PROCESSES

9458. Beck, Don E. & Berg, Robert C. (North Texas State U) **Communication through confrontation: A case study in intergroup conflict reduction.** *Texas Personnel & Guidance Association Journal*, 1973(Mar), Vol 2(1), 13-22.—Defines conflict management and formulates 3 principles of conflict reduction which were successfully applied on one occasion at North Texas State University. There are 2 ways of handling conflict: that of the agitator, who seeks to create, enlarge, and perpetuate the conflict; and the method which uses the influence of an arbitrator. It is emphasized that the 3 principles cited might not work at other times and places, and that conflict management requires great skill. (16 ref)—H. Crouch.

9459. Burke, Ronald J.; Firth, John & McGrattan, Cheryl. (York U, Faculty of Administrative Studies, Downsview, Ontario, Canada) **Husband-wife compatibility and the management of stress.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 243-252.—Various types of husband-wife interpersonal compatibility de-

rived from the Fundamental Interpersonal Relations Orientation inventory (FIRO-B), were related to several measures of pair success in managing or dealing with occupational and life stresses. Types of compatibility included (a) interchange compatibility, (b) originator compatibility, and (c) reciprocal compatibility. The dependent variables were oriented towards mutual helping, open 2-way communication, and effective joint problem-solving. Data were obtained separately from a total of 189 husband-wife pairs. Results indicate that husband-wife compatibility as measured by the FIRO-B was not strongly related to measures of stress management. (20 ref)—*Journal abstract*.

## Group Dynamics & Interpersonal Communication

9460. Adler, Leonore L. & Iverson, Marvin A. (Adelphi U) **Interpersonal distance as a function of task difficulty, praise, status orientation, and sex of partner.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 683-692.—Conducted 2 experiments with undergraduates to measure interpersonal distance between Ss and confederates in the laboratory. 216 undergraduates were used in Exp I and 36 male dyads in Exp II. Ss placed themselves relatively far away from partners who flattered them and who were ascribed lower status. In turn, they sat farther from subordinates who praised them after performing a difficult in comparison with an easy task. Their spatial distance from partners of high status did not differ across conditions. Results suggest that social distance as experienced in status-oriented relationships is manifest in interpersonal physical distance. Differences in interpersonal distance were more reliable in same-sex than in male-female partners. Men tended to be more variable and more distant than women. (24 ref)—*Journal abstract*.

9461. Anderson, Alonzo B. (U California, San Diego) **Combined effects of interpersonal attraction and goal-path clarity on the cohesiveness of task oriented groups.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 68-75.—Examined possible differential effects of value similarity and goal-path clarity on the cohesiveness of small groups. 40 triads of undergraduates were formed, 20 high and 20 low in value similarity, and examined during 2 sessions. The 1st session asked Ss to get to know each other. The 2nd session presented a specific task that permitted the manipulation of goal-path clarity. Results indicate that (a) in the 1st session, reported interpersonal attraction was a function of value similarity, and (b) in the 2nd session, only goal-path clarity (and not value similarity or prior attraction level) affected cohesion. The importance of the extent of goal orientation in determining the variables that affect group cohesiveness is discussed. (17 ref)—*Journal abstract*.

9462. Andreoli, Virginia A.; Worchel, Stephen & Folger, Robert. (U North Carolina, Chapel Hill) **Implied threat to behavioral freedom.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 765-771.—Hypothesized that an individual experiences reactance when he sees another person's freedom being threatened even though the threatening act is not directed toward the observer. 110 female undergraduates initially ranked 5 topics in the order in which they desired to discuss them. Then they overheard a taped conversation in

which a person's (B) freedom was threatened by Person A (threat), threatened by A and then restored by the E (restored), or not threatened by A (no threat). The S expected to interact with either the threatener, the threatened individual, or a neutral person. Following the brief conversation, S rated the 5 topics. Results indicate that the initially most preferred topic declined in desirability in the threat condition significantly more than in the restored and no-threat conditions. This effect was obtained regardless of the individual with whom the S expected future interaction. Results support the hypothesis that reactance can be aroused by implication.

—*Journal abstract.*

9463. Ashour, Ahmed S. (U Alexandria, Faculty of Commerce, Egypt) **Individual differences in coalitional behavior.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 1-6.—Studied individual differences in coalitional behavior using 60 male undergraduates. Variables representing the choice of partner and bargaining on payoff were correlated with one another and with some personality variables (G. H. Shure and R. J. Meeker's conciliation, risk avoidance, external control, and suspiciousness scales). Findings indicate that partner power preference was significantly related to initial bargaining demands and bargaining endurance. The bargaining variables of initial demands, final demands, concessions, and endurance were significantly related to one another. External control was significantly related to partner power preference and bargaining concessions. Results suggest that differences in coalitional behavior that occur independently of situational variation have a significant systematic component. (16 ref)—*Journal abstract.*

9464. Blakar, Rolv M. (U Oslo, Norway) **An experimental method for inquiring into communication.** *European Journal of Social Psychology*, 1973, Vol 3(4), 415-425.—Describes tests of an experimental method for inquiring into the organization of an act of communication. Basically, the method creates an interactional setting where one of the basic prerequisites for successful communication is not satisfied. Test Ss interacted under the false belief that they were sharing the same psychological frame. As they tried to diagnose their communication difficulties and apply different therapeutic tools to improve communication, E observed the effects of a variety of basic phenomena on communication. Another experiment is presented which reveals differences in communication between couples with and without schizophrenic offspring. (23 ref)—*Journal abstract.*

9465. Boettinger, Henry M. **Moving mountains or The art and craft of letting others see things your way.** New York, NY: Collier, 1974. ix, 340 p. \$1.95.—Presents suggestions for improving a person's ability to communicate with others, find and develop new ideas, structure the presentation of these ideas, and get the ideas across to other people. Psychological hints for increasing personal effectiveness and for getting and sustaining other people's attention are discussed.

9466. Bond, Michael H. & Shiraishi, Daisuke. (Chinese U Hong Kong, Chung Chi Coll) **The effect of body lean and status of an interviewer on the non-verbal behavior of Japanese interviewees.** *International Journal*

*of Psychology*, 1974, Vol 9(2), 117-128.—16 male and 16 female 19- to 21-year-old Japanese student volunteers were interviewed either by a high-status or by an equal-status confederate. In the forward-lean condition (used for half the interviews) the interviewer leaned forward 20° while in the backward-lean condition he leaned backward 20°. Distance from S stayed constant for the 2 conditions. Speech and video records measured eye contact, pauses during speech, total speaking time, average response latency, physical movements, and smiling. After the interview, Ss rated the interviewer on 20 contrasting adjective pairs and on 2 interpersonal attraction measures. Factor analyses run separately for male and female Ss for the nonverbal behaviors revealed 3 factors for both sexes, only 2 of which for males and 3 out of 16 for females showed communalities of less than .40. Status manipulation had greater effects upon females than upon males. Females also showed greater responsiveness to posture manipulation. Forward-leaning interviewers appeared more polite and more flexible than backward-leaners to Ss of both sexes. (24 ref)—*E. A. Gavin.*

9467. Carlsmith, J.; Lepper, Mark & Landauer, T. K. (Stanford U) **Children's obedience to adult requests: Interactive effects of anxiety arousal and apparent punitiveness of the adult.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 822-828.—Examined the effects of (a) apparent punitive or rewarding E characteristics and (b) anxiety-provoking or relaxed experimental settings on 52 preschool children's obedience to adult requests. In the 1st session, each child saw a videotape of an unfamiliar adult interacting either positively or punitively with another child. Several days later, each child was shown either an anxiety-provoking or an innocuous film. Immediately afterwards the child was asked by the adult he had seen earlier on videotape to pick up 150 scattered tennis balls, and unobtrusive measures of the child's obedience were obtained. In the relaxed condition, a previously positive adult obtained more obedience; in the anxiety-provoking condition, a previously negative adult was obeyed more. Results support a 2-process conception of obedience and suggest a reinterpretation of earlier findings on "responsiveness to social reinforcement" in terms of compliance. (16 ref)—*Journal abstract.*

9468. Carr, Suzanne J. & Dabbs, James M. (Spelman Coll) **The effects of lighting, distance and intimacy of topic on verbal and visual behavior.** *Sociometry*, 1974(Dec), Vol 37(4), 592-600.—Examined how Ss assess degree of intimacy and how they respond to intimacy. 40 female undergraduates answered 3 nonintimate questions in a baseline interview and 3 intimate questions in an experimental interview, in which they sat far from or near to E in a brightly or dimly lit room. Dependent variables included verbal and visual behavior and questionnaire responses. Ss reduced verbal disclosure and eye contact during the intimate interview. They rated the Dim and Near conditions as more intimate and less appropriate than the Bright and Far, respectively, and they preferred the Near over the Far condition. In the Dim condition, Ss decreased eye contact and increased latency to talk, but the Near-Far distinction did not affect behavior. It is concluded that intimacy

may be independent of appropriateness and preference and may affect verbal and visual behaviors differently.

—*Journal abstract.*

9469. Chapman, Antony J. (U Wales Inst of Science & Technology, Cardiff) **Humorous laughter in children.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 42-49.—Examined the notion that the sharing of humor enhances overt expressive responses (laughter and smiling) and humor ratings. Independent groups of 70 7- and 8-yr-old children listened on headphones to amusing material. They were tested alone or in dyads or triads with confederates of the same sex. In triads, duration of laughter and smiling was inversely related to the amount that confederates looked at one another; this was the case whether confederates were thought to be listening to the same or different recordings. Laughter and smiling scores support the notion that sharing the social situation is crucial in the facilitation of "humorous laughter." A theory of socially facilitated laughter is proposed which draws upon social-facilitation drive theory and the tension-reduction aspects of humor theory. (48 ref)

—*Journal abstract.*

9470. Chertock, Sanford L. (U Montana) **Effect of music on cooperative problem solving by children.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 986.—Studied the effects of 4 different sound conditions (art music, mood music, adults reading aloud, and no sound) on cooperative behaviors in 140 6-9 yr olds. Data from a time-sampling analysis show that noncooperative behaviors were greater under no sound and adults reading aloud, and were reduced under the other 2 conditions.

9471. Davies, Ivor K. (Indiana U, Audio-Visual Ctr) **Some aspects of a theory of advice: The management of an instructional developer-client, evaluator-client relationship.** *Instructional Science*, 1975(Jan), Vol 3(4), 351-373.—Examines the special nature of the client-instructional developer and client-evaluator relationship within the broader and more general context of a theory of advice. An analysis is made of the differing sets of assumptions and expectations that may underlie the relationship, for which 3 common models are recognized. 7 successive phases through which a relationship can typically pass are described in terms of a cycle which runs parallel to the cycle of task-oriented activities more usually recognized. Both cycles, relationship-oriented and task-oriented, need to be managed in such a way that the 2 on-going sets of activity are as compatible as possible. After considering a number of general factors that contribute overall to effective relationships, it is concluded that effectiveness seems to be a product of how the relationship is actually viewed. (15 ref)—*Journal abstract.*

9472. Dovidio, John F. & Morris, William N. (U Delaware) **Effects of stress and commonality of fate on helping behavior.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 145-149.—Studied the joint effects of stress and commonality of fate on helping behavior in a 2 × 2 factorial design. 63 undergraduates were randomly assigned to 1 of 4 conditions in which (a) S and a confederate are both awaiting an experiment involving electric shock (high stress-common fate); (b) S is awaiting an experiment involving electric shock while the confederate is awaiting an innocuous word-association

experiment stress-dissimilar dissimilar fate); (c) S is awaiting the word association experiment while the confederate awaits shock (low stress-dissimilar fate); and (d) S and the confederate are both awaiting an innocuous word association experiment (low stress-common fate). Results indicate that high stress, as compared to low stress, facilitates helping if the potential recipient is in the same stressful situation but inhibits helping if the potential recipient is in a dissimilar and less stressful situation. (15 ref)—*Journal abstract.*

9473. Fischer, Donald G. & Burdeny, Terry C. (U Saskatchewan, Saskatoon, Canada) **Individual shifts and group-shift phenomenon.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 939-954.—Studied the effect of group composition on individual decisions by having 93-man groups of male undergraduates discuss caution-oriented life dilemma items chosen from the Choice Dilemmas Questionnaire (CDQ). Ss were grouped as either high, moderate, or low risk takers and completed the CDQ in isolation, in groups, and again in isolation. Results indicate that (a) there are individual changes in decision which are not reflected in an over-all group change; (b) stability of decisions is influenced by item orientation; (c) majority position exerts disproportionate influence on group decisions; (d) homogeneous groups do not shift; and (e) conformity, compromise and attitude change effects are evident. (16 ref)—*Journal abstract.*

9474. Garner, Katherine & Deutsch, Morton. (New York U) **Cooperative behavior in dyads: Effects of dissimilar goal orientations and differing expectations about the partner.** *Journal of Conflict Resolution*, 1974(Dec), Vol 18(4), 634-645.—Investigated the nature of the interaction between cooperative and competitive persons. It was hypothesized that cooperative behavior would decrease over time in an interaction between the 2. Ss were 60 male undergraduates. Pairs, in which 1 S was competitive and the other cooperative, played 30 trials of a Prisoner's Dilemma game. 3 experimental conditions were created by varying the nature of the information each S received about his partner's orientation. A decrease in cooperative behavior was found only when Ss believed that their (dissimilarly motivated) partner had the same orientation as themselves. When Ss had veridical information about their partner's dissimilar orientation, there was a significant increase in cooperative behavior over time for both members. When Ss had no information about their partner's goal orientation, cooperative behavior remained stable over time. Data are discussed in terms of the active vs passive role taken by Ss in transforming interpersonal situations which they confront.—*Journal abstract.*

9475. Geller, Daniel M.; Goodstein, Lynne; Silver, Maury & Sternberg, Wendy C. (Richmond Coll, City U New York) **On being ignored: The effects of the violation of implicit rules of social interaction.** *Sociometry*, 1974(Dec), Vol 37(4), 541-556.—When people are ignored, their expectations as to the type and amount of attention they should receive are not fulfilled. The experience of being ignored was analyzed in terms of violations of some of the implicit rules for social interaction. A technique was developed in which 2 female confederates systematically ignored 37 female

college students in a laboratory setting. The hypothesis that ignored Ss would participate less in the conversation than the 28 Ss in the control condition was confirmed. Ss did not react to being ignored by leaving, or expressing anger, but by evaluating themselves and their confederates less favorably than did controls. When given an opportunity to reward one of the confederates, ignored Ss responded by rewarding less than did controls.

—*Journal abstract.*

9476. Goffman, Erving. (U Pennsylvania) **Frame analysis: An essay on the organization of experience.** Cambridge, MA: Harvard University Press, 1974. ix, 586 p. \$12.50.—Discusses the rationale of frame analysis, a method of studying how situations are defined and how various alternatives to ordinary activities (e.g., dreams, tests, fictional dramas, and playfulness) are developed. This type of analysis is also applied to everyday language, and its implications for a systematic sociological study of subjective experiences are examined.

9477. Halprin, Lawrence & Burns, Jim. (Lawrence Halprin & Assoc, San Francisco, CA) **Taking part: A workshop approach to collective creativity.** Cambridge, MA: MIT Press, 1974. xv, 328 p. \$9.95.—Describes an approach to the planning, "doing," and accomplishment of group projects and experiences—the Take Part Process. The workshop orientation of the process, its application to varied situations (e.g., therapy of groups and families, community activities, political planning, and teaching), detailed descriptions of specific Take Part Process workshops, and specific guidelines for designing and conducting workshops are discussed.

9478. Horai, Joann; Naccari, Nicholas & Fatoullah, Elliot. (Hofstra U) **The effects of expertise and physical attractiveness upon opinion agreement and liking.** *Sociometry*, 1974(Dec), Vol 37(4), 601-606.—Varied source characteristics of expertise (high, low, or no information) and physical attractiveness (high, low, or no photograph) in a  $3 \times 3$  factorial design to examine their effects on the opinion agreement of 80 9th-grade girls. As expected, opinion agreement was greater for the physically attractive source than for the nondiffering unattractive or unpictured sources and the high expert than for the nondiffering low expert or the source about whom no information was given. The nondiffering attractive and unpictured sources were liked more than the unattractive source.—*Journal abstract.*

9479. Howard, William & Crano, William D. (Michigan State U) **Effects of sex, conversation, location, and size of observer group on bystander intervention in a high risk situation.** *Sociometry*, 1974(Dec), Vol 37(4), 491-507.—Studied the response of naive college Ss to the apparent theft of another's books in a naturalistic field experiment. Consistent with previous laboratory research, the size of the O group had an appreciable negative influence on intervention behavior. Sex of victim, physical location of the encounter, and prior conversation between victim and bystander also proved to be significant determinants of helping in this potentially high-risk situation. Implications of these results for various predictive models of bystander intervention are discussed. (25 ref)—*Journal abstract.*

9480. Ingham, Roger. (U Southampton, England) **Preferences for seating arrangements in two countries.**

*International Journal of Psychology*, 1974, Vol 9(2), 105-115.—83 male and 62 female English Ss and 67 male and 89 female Swedish Ss who made up 3 subsamples of psychology students, nonpsychology students, and non-university Ss for each country, matched for age, education, and occupation, registered their seating arrangement preferences, using a questionnaire method introduced by R. Sommer (see PA, Vol 40:2826). Swedish Ss chose significantly more face-to-face (opposite) seating arrangements than English Ss, and Swedes avoided right-angle seating arrangements. On 10 of 17 items, Swedes showed greater consistency of choice than English Ss, with a paired-comparison test revealing a low nonsignificant *t*-value that may be related to Swedes' avoidance of right-angle seating arrangements. Evidence concerning effects of increasing intimacy on preferred choices proved inconclusive. Possible explanations based upon earlier observations of behavior in various kinds of situations in Sweden and in England lead to suggested implications for intercultural interactions. (23 ref)—E. A. Gavin.

9481. Kohn, Martin & Parnes, Barbara. (William Alanson White Inst of Psychiatry, Psychoanalysis & Psychology, New York, NY) **Social interaction in the classroom: A comparison of apathetic-withdrawn and angry-defiant children.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 165-175.—Conducted 2 studies with a total of 64 preschool children to test the hypothesis that a child's scores on 2 factor-analytically derived dimensions of social-emotional functioning are directly related to the frequency and type of his peer interactions. In study 1 3 measures of O-rated peer interaction correlated negatively and significantly with high scores on the Apathy-Withdrawal dimension. In study 2 observation-based frequency counts showed a high frequency of solitary behavior for apathetic-withdrawn Ss, as well as a number of qualitative differences between the groups in kinds of interactive behavior: angry-defiant Ss tended to be both verbal and negative-hostile, while apathetic-withdrawn children, when they did interact, were unable to cope with aggression directed at them by their peers.—*Journal abstract.*

9482. Kroeker, Larry L.; Forsyth, Douglas R. & Haase, Richard F. (U Rochester, Counseling & Special Services) **Evaluation of a police-youth human relations program.** *Professional Psychology*, 1974(May), Vol 5(2), 140-154.—Employed an encounter-group or T-group method in workshops in an attempt to increase communication between inner-city youths and policemen. 47 policemen were randomly assigned to 1 of 3 treatment or 1 of 3 control groups. 41 inner-city youths met the treatment group criterion of attending at least 4 workshops, and 30 served as a control group; mean age was 18.1 yrs. The Alienation Index Inventory and a projective test consisting of stories written in response to 4 pictures were administered to 2 of the 3 treatment groups before and after the training period. Analysis of variance indicated no significant differences which could be attributed to program effects. Significant effects of pretesting and significant differences between the police and youths in alienation and the perception of intergroup relations are discussed. It is suggested that the lack of program effects may be related to the lack of randomness in the

assignment of the youths to the experimental and control groups. (19 ref)—*B. Lindsey.*

9483. Lamm, Helmut & Trommsdorff, Gisela. (U Mannheim, W Germany) **Group versus individual performance on tasks requiring ideational proficiency (brainstorming): A review.** *European Journal of Social Psychology*, 1973, Vol 3(4), 361-388.—Reviews experiments in brainstorming, comparing individual vs group performance measures. Ss produced ideas relevant to given tasks, while refraining from evaluating the ideas. Results indicate that Ss brainstorming in small groups produced fewer ideas than Ss brainstorming individually. Factors that might be responsible for the inferiority of groups are discussed, especially the role of social inhibition because of its relevance to possible further research. (43 ref)—*Journal abstract.*

9484. Larnitz, Kinley. (U Minnesota, St Paul) **Reanalysis of Vidmar's data on the effects of decision alternatives on verdicts of simulated jurors.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 123-125.—Proposes a simple probabilistic model for explaining the effects of limiting the number of decision alternatives available to a decision maker. The model holds that the possible decisions in the restricted case are distributed in the same proportions as in the unrestricted case. N. Vidmar's data (see PA, Vol 48:7169) on juror verdicts were reanalyzed using this model and appear to be well fit by the model.—*Journal abstract.*

9485. Lynch, Denis J. (U Toledo) **A-B type and the relationship between police officers and ghetto citizens.** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 434-440.—Investigated the A-B therapist-type distinction in a study in which police officers interviewed black male ghetto citizens with the goal of eliciting personal information. Analysis was based on 13 dyads, 7 with a B interviewer and 6 with an A interviewer. Police Ss were white and had a mean age of 34.4 yrs. Citizen Ss were black and had a mean age of 23.5 yrs. Contrary to predictions, As were not more successful than Bs; further, Bs were better liked by the citizens and tended to be rated as more trustworthy. In turn, Bs rated the citizens as more likable than did As. Citizens interviewed by As tended to rate themselves as less active and potent following the interview than did citizens interviewed by Bs. The value of the complementary hypothesis in interpreting the results is noted, as well as the contribution of the citizens' social class to the superior performance of the Bs.—*Journal abstract.*

9486. Monteverde, Frank J.; Paschke, Richard & Tedeschi, James T. (State U New York, Albany) **The effectiveness of honesty and deceit as influence tactics.** *Sociometry*, 1974(Dec), Vol 37(4), 583-591.—40 male undergraduates possessed a unilateral power advantage over a simulated opponent in a Prisoner's Dilemma game. In response to the Ss' threats demanding a cooperative response, the simulated target's verbally announced behavioral intentions and his subsequent responses were manipulated in a 2 × 2 factorial design: Honest-Compliant, Honest-Defiant, Dishonest-Compliant, and Dishonest-Defiant. Ss sent more threats to a compliant than a defiant target. When the target was Honest-Compliant, he converted the Ss into mutual cooperators; but when he was Dishonest-Compliant, Ss

exploited him. While behavioral defiance generally inhibited Ss from sending threats, when the defiant target used deceit in the form of announcing intentions to comply, he induced Ss to make themselves vulnerable to exploitation.—*Journal abstract.*

9487. Myers, David G. & Bach, Paul J. (Hope Coll, Holland, MI) **Discussion effects on militarism-pacifism: A test of the group polarization hypothesis.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 741-747.—Studied group-induced change processes in 2 experiments using a military decision simulation. In Exp I, 2 groups of relatively pacifistic Ss (doves) and relatively militaristic Ss (hawks) (85 undergraduates) were separated for discussion of hypothetical situations relevant to their value differences. It was predicted that discussion within the homogeneous communities of doves and hawks would increase the polarization between the 2 communities. Contrary to prediction, both communities of Ss shifted to increased pacifism following discussion. Exp II, with 117 Ss, replicated this attitude shift and explored informational and normative influence explanations of it. Results indicate that informational mechanisms were operating; support was not obtained for social comparison processes.—*Journal abstract.*

9488. Pedersen, Darhl M. & Shears, Loyda M. (Brigham Young U) **Effects of an interpersonal game and of confinement on personal space.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 838-845.—Pretested pairs of male junior college students ( $N = 170$ ) on 5 personal space measures. They were then randomly assigned to 1 of 3 treatments: game (Ss played an interpersonal game), confinement (Ss were confined in a cubicle in which they were crowded together), and control (Ss were separated). After 1 hr, Ss were posttested on the measures. Personal space was reduced from pre- to posttesting across all treatments for 6 of 8 scores. An analysis of significant Treatment Testing interactions indicated a larger personal space reduction for both experimental groups than for the control group. No difference was found between the 2 experimental groups. Finally, personal space was reduced for the control group on behavioral measures but not on simulated measures.—*Journal abstract.*

9489. Riedesel, Paul L. (U Tulsa) **Bales reconsidered: A critical analysis of popularity and leadership differentiation.** *Sociometry*, 1974(Dec), Vol 37(4), 557-564.—Shows that sociometric measures of popularity used by many students of leadership differentiation exhibit a serious bias. Unless corrected by a standardization, such measures misrepresent the popularity hierarchy and may result in faulty estimation of the differentiation of instrumental expressive leadership. Some of R. F. Bales's basic data are questioned and reinterpreted within the framework of P. Blau's theory of integration.—*Journal abstract.*

9490. Scott, W. E. & Cherrington, David J. (Indiana U, Graduate School of Business) **Effects of competitive, cooperative, and individualistic reinforcement contingencies.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 748-758.—Of 135 undergraduates, those who were told that they were in a competitive contingency produced more and reported higher levels of

arousal and less interpersonal attraction than Ss who were told they were in cooperative or individualistic contingencies. Those who were rewarded in the various conditions reported higher levels of interpersonal attraction and task attractiveness, but there was little evidence of a differential effect. It is concluded that the behavioral effects of cooperative and competitive conditions depend upon the reinforcement contingencies in effect. (33 ref) —*Journal abstract.*

9491. Shubik, Martin; Wolf, Gerrit & Poon, Byron. (Yale U) **Perception of payoff structure and opponent's behavior in related matrix games.** *Journal of Conflict Resolution*, 1974(Dec), Vol 18(4), 646-655.—Investigated to what extent Ss would recognize similarities between payoff matrices that vary in game theoretic information conditions. Ss ( $N = 196$ ) failed to note similarities in patterns of payoffs between matrices but did recognize patterns of behavior of an opponent, demonstrating the importance of behavioral processes as opposed to a concern with structures in groups.

9492. Spoedlers-Claes, Rita. (Ghent State U, Belgium) **Small-group effectiveness on an administrative task as influenced by knowledge of results and sex composition of the group.** *European Journal of Social Psychology*, 1973, Vol 3(4), 389-401.—Conducted 2 experiments to investigate possible extensions of E. A. Locke's theory of task motivation and incentives (1968). In Exp I, using 192 Ss, the effect of knowledge of results (KR) on small-group effectiveness (SGE) was analyzed. The SGE measurements (productivity and group atmosphere) were based on a subjective operationalization of the concept "small group effectiveness." Results of analysis of variance to show the influence of KR on SGE supported Locke's theory. Exp II compared 64 Ss, in male and female groups, to determine whether sex composition of the group would have an effect on SGE. Results of  $t$  tests also supported Locke's theory. Limitations and implications of these results are discussed. (17 ref)—*Journal abstract.*

9493. Terhune, Kenneth W. (Niagara Falls Community Mental Health Ctr, NY) **"Wash-in," "wash-out," and systemic effects in extended Prisoner's Dilemma.** *Journal of Conflict Resolution*, 1974(Dec), Vol 18(4), 656-685.—Investigated the hypothesis that a long Prisoner's Dilemma (PD) game would reveal behavioral differences among motive groups that a short game would not. A 150-trial PD game, played for money, was used to study the developmental effects of motive constellations and 1st-trial outcome on cooperation-conflict behavior. Ss were 200 18-25 yr old males. Game partners were matched for their dominance in needs for achievement, affiliation, or power, as measured by the Thematic Apperception Test. Results reveal the following: (a) Motive groups developed considerably different levels of cooperation-conflict by the end of the games. (b) Some motive groups did not behave as hypothesized. (c) 1st-trial outcomes affected subsequent behavior, but the effects "washed out" by the end of the games. The discussion emphasizes the appropriateness of the systems model for understanding personality and situational effects in social interaction. (18 ref)—*Journal abstract.*

9494. Thibaut, John; Friedland, Nehemia & Walker, Laurens. (U North Carolina, Chapel Hill) **Compliance**

**with rules: Some social determinants.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 792-801.—Studied adherence to rules as a function of patterns of interdependence inherent in rulemaker-individual interactions as well as of properties pertaining to rule enforcement procedures. Data from 96 undergraduates who played a simulated business game show that individuals observed rules more closely in correspondent than in noncorrespondent rulemaker-individual interactions. In the former, adherence to rules was positively related to the extent of individuals' participation in the rule-making procedure and negatively related to the specificity with which rules were defined. These 2 trends were reversed in a noncorrespondent rulemaker-individual interaction. Finally, an effect attributable to the presence or absence of surveillance was found in the noncorrespondent conditions but not in the correspondent conditions.—*Journal abstract.*

9495. Van de Ven, Andrew H. & Delbecq, André L. (Kent State U, Graduate School of Business Administration) **The effectiveness of nominal, delphi, and interacting group decision making processes.** *Academy of Management Journal*, 1974(Dec), Vol 17(4), 605-621.—Conducted a formal experimental comparison of the effectiveness of alternative group decision-making processes on an applied problem that was characterized as very difficult, had no solution that would be acceptable to different interest groups, and aroused highly emotional and subjective reactions (defining job descriptions of part-time student dormitory counselors). Effectiveness was defined as the quantity of unique ideas generated by a group and the perceived level of satisfaction group participants experienced with the decision process. 20 nominal group technique (NGT), 20 delphi, and 20 interacting groups, each composed of 7 heterogeneous members (i.e., undergraduates and university administrators), were compared. Results suggest that when confronted with a fact-finding problem that requires the pooled judgment of a group of people, 2 alternative procedures can be used: (a) the Delbecq-Van de Ven NGT for situations where people are easily brought together physically and for problems requiring immediate data, and (b) the Dalkey delphi technique for problems where the cost of bringing people together is high. Both the NGT and the delphi method are more effective than the conventional group discussion process. (33 ref)—*Journal summary.*

9496. Wilson, Melvin N. & Rappaport, Julian. (U Illinois) **Personal self-disclosure: Expectancy and situational effects.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 901-908.—96 male undergraduates, selected from a pool of 169 because of their high or low scores on the Jourard Self-Disclosure Questionnaire (JSDQ), were randomly assigned to 1 of 2 conditions of specific expectancy, in which they were told that they would find it either easy or difficult to self-disclose to a stranger interviewer, and 1 of 3 conditions of interviewers' behavior (personal, impersonal, or no disclosure). The JSDQ, scored for anticipated self-disclosure but not for recalled self-disclosure, predicted observed performance. The specific expectancy manipulation and the intimacy level of topics also had significant effects on self-disclosure. A 3-way interaction between generalized

and specific expectancy and topic intimacy was also found. (28 ref)—*Journal abstract*.

### Social Perception & Motivation & Attitudes

9497. Bell, Paul A. & Baron, Robert A. (Purdue U) **Environmental influences on attraction: Effects of heat, attitude similarity, and personal evaluations.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 479-481. —80 undergraduate males received either a positive or a negative personal evaluation from an attitudinally similar or dissimilar confederate. Experimental sessions were conducted under either comfortably cool (73°F) or uncomfortably hot (92°F) environmental conditions. Attraction toward the confederate was primarily influenced by the personal evaluation and attitude similarity variables. Although high ambient temperatures markedly decreased Ss' affective state, exposure to heat did not consistently lower their attraction toward the confederate. Several procedural differences are proposed to account for the inconsistent influence of heat on attraction reported in the present and previous research. —*Journal abstract*.

9498. Braver, Sanford L. & Barnett, Bruce. (Arizona State U) **Perception of opponent's motives and cooperation in a mixed-motive game.** *Journal of Conflict Resolution*, 1974(Dec), Vol 18(4), 686-699. —Investigated the hypothesis that the perceived goal and incentives of the other influences an S's behavior in a mixed-motive game. 2 studies were conducted using male undergraduates as Ss, 55 in Study 1 and 32 in Study 2. Study 1 used instructions to vary the perceived goal of the other, and payoff values to vary the incentive of the other to defect. Study 2 varied the other's incentive as well as the S's incentive to defect, both by payoff values. Results indicate that the perceived goal of the other strongly influenced the S's cooperation. The incentive of the other also affected cooperation, except when the other was assumed to be pursuing a benevolent goal. S's incentive did not affect his cooperation nearly as much as did his opponent's incentive. —*Journal abstract*.

9499. Brickman, Philip & Bryan, James H. (Northwestern U) **Moral judgment of theft, charity, and third-party transfers that increase or decrease equality.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 156-161. —Suggests that theft and charity are special cases of transfers within a distribution of goods in which the agent of transfer is directly affected by the transfer, either gaining (in theft) or losing (in charity). In a 3rd-party transfer the person effecting the change is one whose own resources are neither increased nor decreased. While charity may be approved and theft disapproved regardless of their distributional context, it was hypothesized that the evaluation of 3rd-party transfers would depend heavily upon their impact on equality. 60 5th graders rated a model who surreptitiously modified the distribution of rewards in a 4-person group such that the model's outcome was either augmented (by theft), reduced (by charity), or unaffected, and the entire distribution was thereby either made more equal or less equal. 3rd-party transfers were viewed more favorably if they increased equality or represented a "Robin Hood" transfer. Charitable transfers were also

viewed more favorably if they increased equality, while thefts were not. —*Journal abstract*.

9500. Brickman, Philip & Seligman, Clive. (Northwestern U) **Effects of public and private expectancies on attributions of competence and interpersonal attraction.** *Journal of Personality*, 1974(Dec), Vol 42(4), 558-568. —Explored the relative importance of public and private expectancies and possible discrepancies between them on judgments of a person's competence and attractiveness. For attributions of competence (Exp I with 20 undergraduates), private expectancies were more important than public ones, high expectancies were more advantageous than low ones, and there was no penalty for inconsistency. For ratings of attraction (Exp II with 22 undergraduates), public expectancies were more important than private ones, low expectancies were more advantageous than high ones, and there was a sharp penalty for inconsistency as well as inaccuracy. It is suggested that conflicting strategic pressures toward high, low, and accurate expectancies exist, with public expectancies that are slightly lower than private expectancies representing perhaps an optimal compromise. —*Journal summary*.

9501. Carter, Thomas M. (Albion Coll) **A comparison of the attitudes of early adolescents with the attitudes of adults in respect to patterns of behavior.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 12-17. —Compared the attitudes of 110 junior high school students with those of 90 members of a local chapter of Rotary International on a 7-point rating scale ranging from -3 (bad) to +3 (excellent). Descriptive sentences illustrated the attitudes to be rated. The 7 behavior patterns rated highest by the students were gratitude, good health, alertness, friendliness, neatness, trustworthiness, and helpfulness. Rotary members considered honesty, trustworthiness, sense of fair play, sincerity, helpfulness, punctuality, and self-reliance most important. The technique is considered ambiguous, however, as indicated by the word "courteous": should a well-adjusted person be courteous to a bandit? It is suggested that the labels should indicate the specific situations and conditions that are being rated. —A. J. Ter Keurst.

9502. Cleveland, Sidney E. (VA Hosp, Houston, TX) **Changes in human tissue donation attitudes 1969-74.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 1-3. —Studied the personal motivations of 30 human tissue donors, members of The Living Bank, and 30 matched nondonors. All Ss were given the Organ Transplant Questionnaire, the Rorschach, Rotter's Internal-External Control Scale, the MMPI, the Thematic Apperception Test, and the Allport-Vernon-Lindzey Study of Values. Results show that donors and nondonors differ sharply on basic personality factors.

9503. Cleveland, Sidney E. (VA Hosp, Houston, TX) **Personality characteristics, body image and social attitudes of organ transplant donors vs nondonors.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 3-5. —Replicates a 1969 study by S. E. Cleveland and D. L. Johnson (see PA, Vol 44:18688) of attitudes toward human tissue donation, using the Organ Transplant Questionnaire. As before, prospective donors were better educated and of higher

socioeconomic status than nondonors. Data indicate wider acceptance of human donation today by all types of S groups in the general population.

9504. Comazzi, A. & Invernizzi, G. (U Milan, Italy) [A study of students' emotional reactions regarding organ donation.] (Ital) *Medicina Psicosomatica*, 1972(Jul), Vol 17(3), 215-222.—Administered a questionnaire about giving parts of one's body after death to 82 high school students of both sexes. Ss showed hesitation about donating the heart, but not the cornea or kidney. They preferred to accept transplants of artificial organs rather than human organs. Animal organs were not viewed favorably. Willingness to donate organs seemed to be proportional to the sociocultural level. Reluctance to donate is interpreted as a transference to the rational level of the unconscious fear of mutilation. (English & French summaries)—*D. Araoz*.

9505. Deci, Edward L.; Benware, Carl & Landy, David. (U Rochester) **The attribution of motivation as a function of output and rewards.** *Journal of Personality*, 1974(Dec), Vol 42(4), 652-667.—Investigated the effects of a performer's output and level of reward on the attributions which Os make about his intrinsic motivation and extrinsic motivation. In Exp I with 104 undergraduates, the level of output (high vs low) and hourly payments (high vs low) were varied, and all the predicted main effects were obtained. Ss attributed greater intrinsic and less extrinsic motivation to performers when rewards were low than when they were high. They also attributed greater intrinsic and less extrinsic motivation to performers when output was high than when it was low. Exp II varied the nature of payment with 120 undergraduates. The contingent payments were such that the total payment, as well as output, was constant across nature of payment conditions. The predicted interactions were obtained. In the high-output-high-reward conditions, Ss attributed greater extrinsic motivation when rewards were contingent than when they were noncontingent. In the low-output-low-reward conditions, Ss attributed less extrinsic motivation when rewards were contingent than when they were noncontingent. Further, in the high-output-high-reward conditions, Ss attributed less intrinsic motivation when rewards were contingent than when they were noncontingent. In the low-output-low-reward conditions, they attributed greater intrinsic motivation when rewards were contingent than when they were noncontingent. —*Journal abstract*.

9506. Dertke, Max C.; Penner, Louis A. & Ulrich, Kathleen. (U South Florida, Criminal Justice Program) **Observer's reporting of shoplifting as a function of thief's race and sex.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 213-221.—Investigated the reporting of a clearly observed theft as a function of the race and sex of the thief and the sex of the O. 240 white male and female shoppers were given the opportunity either to spontaneously report an act of shoplifting or to confirm the fact that the theft had occurred by responding affirmatively to a direct question. Thefts were perpetrated by a white male, white female, black male, or black female confederate. Results show that blacks were reported or confirmed more often than whites. Results are discussed in terms of (a) behavioral manifestations of

race prejudice and (b) prior research on victim characteristics and helping. (17 ref)—*Journal abstract*.

9507. Enzle, Michael E.; Hansen, Randal D. & Lowe, Charles A. (U Connecticut) **Causal attribution in the mixed-motive game: Effects of facilitory and inhibitory environmental forces.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 50-54.—Studied the effects of environmental forces in a matrix game on Ss' causal attributions for a simulated other's behavior, using 124 female undergraduates in a 2 × 2 factorial design (100% cooperative vs 100% competitive strategy, competition-facilitating vs competition-inhibiting matrix). Significant Matrix × Strategy interactions for attribution measures indicate that personal attributions were made for behavior which occurred despite inhibitory environmental forces and that environmental attributions were made for behavior which occurred in line with facilitory environmental forces. There was no evidence that causal attributions produced by the procedures mediated either game behavior or trust and liking for the other.—*Journal abstract*.

9508. Etaugh, Claire & Sanders, Sharon. (Bradley U) **Evaluation of performance as a function of status and sex variables.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 237-241.—Conducted a study of 210 undergraduates to test the "contrast" hypothesis that the performance of well-known females will be overestimated. Ss were shown paintings by artists who were described as males or females, and as unknown or well-known; paintings were also described as contest entries or winners. Results indicate that well-known artists received higher ratings than unknown artists, regardless of sex. Ss applied sex-role stereotypes in judging opposite-sex, but not same-sex, artists. The "contrast" hypothesis was not supported, but another contrast effect was found—the creativity of unknown winning artists was overrated.—*Journal abstract*.

9509. Feather, N. T. & Simon, J. G. (Flinders U South Australia, School of Social Sciences, Bedford Park) **Reactions to male and female success and failure in sex-linked occupations: Impressions of personality, causal attributions, and perceived likelihood of different consequences.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 20-31.—48 female high school students responded to 3 short verbal cues in which either a male or female character succeeded or failed in an examination qualifying the male (or female) for entry into an occupation. 3 occupations were involved varying in masculine dominance (medicine, teaching, and nursing). In responding to each cue, Ss first rated the character in the cue on semantic differential scales to provide impressions of personality, then rated the importance of different possible causes of the outcome (causal attribution), and finally rated the likelihood that each of a set of possible consequences might follow the outcome. Results indicate a fairly pervasive tendency for the female Ss to upgrade successful males in relation to unsuccessful males but to downgrade successful females in relation to unsuccessful females. (19 ref)—*Journal abstract*.

9510. Fuller, Carol H. **Comparison of two experimental paradigms as tests of Heider's balance theory.** *Journal of Personality & Social Psychology*,

1974(Dec), Vol 30(6), 802-806.—Tested predictions from attitude and balance theory using 2 experimental paradigms with 64 male undergraduates. A completion task and a rating task were directly compared to investigate the relative applicability of these 2 research designs for testing F. Heider's and T. M. Newcomb's balance models. Ss completed structures in the manner predicted by Heider's theory; however, not all such structures were rated as pleasant. It is suggested that the rating method is not an appropriate method for testing a cognitive balance model. Support was found for Newcomb's concept of nonbalance in that Ss were more likely to give a neutral response to partial structures when they contained 1 or 2 negative relations than when they contained only positive relations. (25 ref)—*Journal abstract*.

9511. Garrett, Gerald R. & Bahr, Howard M. (U Massachusetts, Boston) **Comparison of self-rating and quantity-frequency measures of drinking.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1294-1306.—Compared self-reports of heavy, moderate, and light drinking to quantity-frequency classifications (Q-F) using data from interviews with 402 homeless men, 125 men from a lower-income racially mixed neighborhood, 94 upper-income men, 52 emergency women's shelter residents, and 64, 185, and 82 women from a Manhattan shopping district, the upper West Side, and the East Side of New York. More of the homeless men and women were classified as heavy drinkers regardless of the system used. More men reported themselves as lighter drinkers than the Q-F index indicated. Women were as likely to overstate as understate their drinking status. Compared with the Q-F rating, 80-84% of the women and 53-64% of the men correctly classified their own drinking status. It is concluded that there is no evidence that the Q-F index is any more valid than the self-rating measure and that variations in the 2 systems may reflect differences in self-perceived norms of alcohol consumption that are sex linked and related to the drinking milieu. (35 ref)—*Journal abstract*.

9512. Goldstein, Jeffrey H.; Davis, Roger W. & Herman, Dennis. (Temple U) **Escalation of aggression: Experimental studies.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 162-170.—A finding commonly obtained in research using the Buss "aggression machine" is a main effect for trial blocks, indicating an escalation in shock intensity over trials. Theoretical explanations for this effect were tested in a modified verbal operant-conditioning situation. In Exp I 48 male undergraduates could administer any of 10 levels of positive reinforcement to a learner for correct verbal responses or any of 10 levels of negative reinforcement to a learner for incorrect responses. 24 Ss were required to begin with weak, and 24 with strong, reinforcements. Results indicate that, regardless of condition, Ss gave more intense reinforcements as the learning trials progressed. Those who administered negative reinforcements devalued the learner relative to those who administered positive reinforcements. In Exp II a role-playing procedure was used in which 44 undergraduates administered either positive or negative reinforcements to a learner whose performance either did or did not

improve over trials. Again, in all experimental groups, Ss administered increasingly intense reinforcements over trials. Results support disinhibition theory of anti- and prosocial behavior. (39 ref)—*Journal abstract*.

9513. Harris, Mary B. & Ramsey, Sandra. (U New Mexico) **Stereotypes of athletes.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 705-706.—To ascertain whether racial and sexual stereotypes of athletes exist, 140 female junior high school students rated 6 descriptions of athletes which were presented as pertaining to a male or female black, Chicano, or Anglo athlete. No evidence for ethnic or sexual stereotyping was found, although descriptions of athletes in different sports were rated differently.

9514. Harrison, Danny E.; Bennett, Walter H.; Globetti, Gerald & Alsikafi, Majeed. (Auburn U, Montgomery) **Premarital sexual standards of rural youth.** *Journal of Sex Research*, 1974(Nov), Vol 10(4), 266-277.—Measures and evaluates premarital sexual standards of 132 adolescents in a small Mississippi community. (16 ref)

9515. Holmes, David S. & Jackson, Thomas H. (U Kansas) **Influence of locus of control on interpersonal attraction and affective reactions in situations involving reward and punishment.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 132-136.—96 undergraduates with high and low scores on Rotter's Internal-External Control Scale participated in individual discussions with an E who either (a) rewarded and then punished, (b) punished and then rewarded, or (c) gave no evaluative feedback after the S's responses. It was hypothesized (a) that the internally controlled Ss, as compared to externally controlled Ss, would be more attracted to E in the conditions involving rewards and punishments regardless of the sequencing and (b) that the reverse would be true in the nonevaluative control condition. The prediction was consistently supported, and Ss' feelings of anger and anxiety during the discussions generally complemented the attention and attraction hypotheses. Results indicate that individual differences influence attraction in situations involving rewards and punishments and they offer a prescription for developing interpersonal attraction and minimizing anger: Offer rewards to internally controlled persons and remain neutral with externally controlled persons. —*Journal abstract*.

9516. Innes, John M. (U Edinburgh, Scotland) **The semantics of asking a favour: An attempt to replicate cross-culturally.** *International Journal of Psychology*, 1974, Vol 9(1), 57-61.—Reports replication in Edinburgh, Scotland, of a field investigation originally made in the United States (New Haven, Connecticut), in which companionless female passersby were asked, under differing conditions, to post a letter. Of the 120 Scots approached, 81% complied; in the earlier study, 50% of the American Ss had complied. For both Scottish and American samples, legitimate requests brought a higher degree of compliance than illegitimate ones; i.e., asking because of a need to catch a train is more likely to elicit compliance than asking because of a need to go shopping.—E. A. Gavin.

9517. Insko, Chester A.; Turnbull, William & Yandell, Ben. (U North Carolina) **Facilitative and inhibiting**

effects of distraction on attitude change. *Sociometry*, 1974(Dec), Vol 37(4), 508-528.—218 male undergraduates listened to a persuasive communication while working on a task and were told either to attend primarily to the communication (message set) or to the task (task set). There was, in addition, a message-only condition. Relative to the message-only condition, message set increased attitude change and communication-favorable thoughts, and decreased number of counterarguments and recall. Relative to the message-set and message-only conditions, task set decreased attitude change, recall, and effort attending to the communication. It is argued that different mediational models were operating for message-set distraction and task-set distraction. (18 ref)—*Journal abstract*.

9518. Jernryd, Elisabeth. [Optimal resistance to authority and propaganda: A study of age and sex differences.] (Swed) *Pedagogisk-Psychologiska Problem*, 1974(Jun), No 239, 143 p.—Studied age and sex differences in measurement variables constructed to assess dependent-independent behavior in 5th, 7th, and 9th graders, as well as their ability to evaluate critically different types of information and to resist one-sided influence. Some aspects of personality were also investigated. Ss' evaluative ability did not seem to increase noticeably between the ages of 10 and 16 yrs. The older Ss expressed less authoritarian, dogmatic, and rigid opinions. Irrespective of age, females were more inclined to display anxiety than males. (81 ref)—*English abstract*.

9519. Jiobu, Robert M. & Knowles, Eric S. (Ohio State U) Norm strength and alms giving: An observational study. *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 205-211.—Conducted an observational study of pedestrians passing a Salvation Army kettle to examine the applicability of normative theory to helping behavior. It is suggested that temporally defined norms, such as those associated with holidays, are not subject to the criticisms applied to situationally defined norms. The charitable gift-giving norms associated with Christmas were assumed to grow stronger as Christmas Day drew nearer. Results indicate that the average donation to the kettle increased with temporal nearness to Christmas. Analysis of these data and earlier studies suggests that intensity of charitable behavior may be associated with S characteristics including strength of felt norms, whereas extensity may be associated with situational features.—*Journal abstract*.

9520. Katz, Marsha. (Michigan State U) Trivial games as predictors of a mixed-motive game. *Journal of Conflict Resolution*, 1974(Dec), Vol 18(4), 700-706.—2 trivial games, one relevant to the trait of trust, the other to the trait of competition, were used to predict behavior in the mixed-motive game of Chicken. Ss were 78 female and 84 male college students. Results show that behavior in the Chicken game was related to choice in the "competition" game but not in the "trust" game. Findings suggest that competition is the dominant motive in the Chicken game, and demonstrate the utility of using trivial games to determine the relative influence of the various motives that could be salient in mixed-motive situations.—*Journal abstract*.

9521. Kleck, Robert E. & Rubenstein, Carin. (Dartmouth Coll) Physical attractiveness, perceived attitude

similarity, and interpersonal attraction in an opposite-sex encounter. *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 107-114.—Studied the effects of physical appearance (attractive-unattractive) and perceived attitude similarity (high-low) on self-report and nonverbal measures of interpersonal attraction. The physical attractiveness of female confederates, but not their perceived degree of similarity to the 48 male undergraduate Ss, resulted in a number of significant effects during the experimental session. Self-report measures taken 2-4 wks subsequent to the laboratory interaction revealed that Ss had thought more about their partner in the interim, continued to feel they liked her more, and tended to remember more details of her appearance if she had been attractive rather than unattractive. Again, no effects for perceived attitude similarity were detected. (22 ref)—*Journal abstract*.

9522. Kleinke, Chris L.; Staneski, Richard A. & Berger, Dale E. (Wheaton Coll) Evaluation of an interviewer as a function of interviewer gaze, reinforcement of subject gaze, and interviewer attractiveness. *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 115-122.—54 male undergraduates were interviewed by female interviewers who gazed constantly, intermittently, or not at all. Experimental Ss were reinforced with green light feedback whenever they gazed at the interviewers and were punished with red light feedback when they averted gaze for more than 6 sec. Control Ss received noncontingent green and red light feedback. Although gaze of experimental Ss toward the interviewers was increased significantly, their attitudes toward the interviewers remained the same. This was probably because the Ss did not discriminate that their gazing behavior had changed. Ss gave the most unfavorable reactions to the nongazing interviewers, rating them as least attractive, giving them the shortest answers, and sitting farthest from them during the debriefing session. Ss did not discriminate between high- and low-attractive interviewers, except that the latter were rated disproportionately low on attentiveness if they did not gaze. Interviewers with high rates of talking were preferred over interviewers with low rates of talking. (28 ref)—*Journal abstract*.

9523. Korten, Frances F. The influence of culture and sex on the perception of persons. *International Journal of Psychology*, 1974, Vol 9(1), 31-44.—39 male Ethiopian university students and 47 male and female American university students described persons they knew well and persons they knew very little. Ethiopians gave their descriptions orally while Americans wrote theirs. Content analysis of the open-ended descriptions, based on a 12-category system devised by L. Beach and M. Wertheimer (see PA, Vol 36:4HJ67B), revealed many highly significant differences in category usage, demonstrating that the 2 groups perceived fellow university students in very different ways. Ethiopians stressed Interpersonal Interactions and Opinions and Beliefs far more than Americans while Americans stressed Abilities and Knowledge, Cognitive-Emotional Style, and Interpersonal Style far more than the Ethiopians. Both groups used the category Interests and Activities extensively. American females differed significantly from American males in 5 of the 12 categories, although the differences

were not as dramatic as those between Ethiopians and Americans. It appears that cultural needs affect the importance of particular perceptual categories and in this way shape the interpersonal perceptions of a culture's members. (25 ref)—*E. A. Gavin.*

9524. Larsen, Knud S. (Oregon State U) **Conformity in the Asch experiment.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 303-304.—Replicated S. Asch's (1956) experiments, using 24 male and female Ss. Results show that on a total of 18 trials, 62.5% of Ss conformed on 1 or more of these trials. It is suggested that different time periods create different pressures toward conformity.

9525. Larsen, Knud S. (Oregon State U) **Social cost, belief incongruence, and race: Experiments in choice behavior.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 253-267.—Conducted 5 studies and 3 experiments with a total of 295 graduate, undergraduate, and high school students to investigate the relative importance of social cost, belief incongruence, and race in the preference for "types" of people or stooges. Ss in the studies completed a Person Preference Test which required them to state their preference for 8 person types, composed of all possible variations of the 3 variables across 6 relationships varying in intimacy. Ss ranked in order of preference the 8 person types, and 1 study asked the Ss to indicate preference for each of all possible pairs. Results show that complete congruency (same beliefs, race, and low social costs) was the most important factor. Race was particularly important for the most intimate relationship. Excluding a consideration of complete congruence, the relative importance of the variables were social cost, belief incongruence, and race. The laboratory experiments tended to support the relative importance of social cost, in the preference for stooges differing in social cost, belief incongruence, and race.—*Journal abstract.*

9526. Lefebvre, Luc M. (Catholic U Louvain, Belgium) **An experimental approach to the use of ingratiation tactics under homogeneous and heterogeneous dyads.** *European Journal of Social Psychology*, 1973, Vol 3(4), 427-445.—Investigated the occurrence of ingratiation as mediated by sex of sender and recipient in a  $2 \times 2 \times 2$  factorial design, and explored the structure and preference of ingratiation overtures. 80 male and female Ss enacted the role of interviewees and made themselves amiable or acted spontaneously to improve evaluation by the interviewer. Results support the hypothesis that ingratiation behavior would be distinguished from spontaneous behavior indicating opinion conformity, self-presentation, other-enhancement, and smiling. Modesty as an ingratiation tactic occurred more under the female homogeneous dyad, there were more ingratiation overtures under the heterogeneous than homogeneous dyads on some verbal measures, and less ingratiation smiling occurred under the male dyad. Verbal and nonverbal overtures were found to possess a different structure, and opinion conformity was the most sensitive differentiator between the verbal ingratiation overtures. (24 ref)—*Journal abstract.*

9527. Lerner, Richard M. & Frank, Phyllis. (Eastern Michigan U) **Relation of race and sex to supermarket helping behavior.** *Journal of Social Psychology*,

1974(Dec), Vol 94(2), 201-203.—Conducted a study of 66 white women and 36 white men as potential helpers to determine the relationship of the race and sex of a person in need of help to the frequency of helping behavior. Ss could help, or not help, a white or a black male or female, respectively, whose bag of groceries had just broken in front of a supermarket. Overall, the white females tended to help more than the white males, but the overall percentages of help given to males or females, or to blacks or whites, were not significantly different. The distribution of the white males' and females' helping did differ in relation to the sex and race of the person in need of help. Despite these differences, no support was found for a racial- or sexual-congruence-increased-helping-frequency relation.—*Journal abstract.*

9528. Lerner, Richard M.; Knapp, John R. & Pool, Kenneth B. (Eastern Michigan U) **Structure of body-build stereotypes: A methodological analysis.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 719-729.—Used 182 undergraduates to study the comparability of body build stereotypes depicted through the use of various response formats. Stereotypes toward endomorph and mesomorph body types, respectively, were derived through responses to (a) a traditional, forced-choice format; (b) a dimensionalized, bipolar item format requiring placement of 10 endomorphs and 10 mesomorphs along each of 10 9-point dimensions; (c) a format identical to (b) above except in the requirement of only 1 endomorph or mesomorph attribution for each dimension; and (d) a format requiring the estimation of the percentage of time an endomorph and a mesomorph, respectively, manifested the item-characteristic. Although mean responses derived from the latter 3 methods were consistent in direction with corresponding forced-choice, frequency data, the intradimensional separation of most of these means was not markedly disparate. Moreover, correlations between forced-choice responses and any and all of the latter methods were markedly low, although correlations among these latter methods were moderate.—*Journal abstract.*

9529. Maller, Allen S. (Temple Akiba, Culver City, CA) **Religious pluralism, political values and American teenagers.** *Religious Education*, 1974(Jul), Vol 69(4), 446-450.—Presents data from a nation-wide 1971 survey of 23,000 promising 11th- and 12th-grade students who were among the top 2% of students in their high schools. Answers to questions concerning moral and social issues showed differences among Protestant, Catholic, Jewish, and Black youths. Whether differences are statistically significant is not stated. Comparison of results with adult surveys reveals that adolescent responses tend to differ as much as those of adults.—*E. A. Gavin.*

9530. McComas, William C. & Noll, Mark E. (Manchester Coll, England) **Effects of seriousness of charge and punishment severity on the judgments of simulated jurors.** *Psychological Record*, 1974(Fal), Vol 24(4), 545-547.—Studies of the effects of decision alternatives on the verdict returned by simulated jurors have confounded the seriousness of the criminal charge with the severity of punishment associated with the charge. The present experiment crossed charge (1st degree murder, 2nd degree murder, and manslaughter) with punishment severity in a  $3 \times 3$  factorial design.

From a description of an attempted robbery and consequent killing of a store proprietor, 108 undergraduates rated the guilt of the defendant. Only seriousness of charge had a significant effect on guilt ratings (the lower the charge, the greater the guilt), suggesting that this factor rather than severity of associated punishment accounts for results in previous studies.—*Journal abstract.*

9531. Mishra, Bhaskar D. (M.L.K. Coll, Gonda, India) **The role of verbal description in person-perception.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 45-47.—Studied how person-perception is affected by verbal description. 40 undergraduate Ss rated a stimulus person on a 7-point semantic differential scale containing 37 bipolar traits. The ratings of the Ss who both observed the stimulus person and were given a verbal description about him differed significantly ( $p < .01$ ) from those of the Ss who observed him without an accompanying verbal description. It is concluded that the perception of a stimulus person is capable of being affected by information about him conveyed in a verbal description.—*B. Lindsey.*

9532. Morse, Stanley J.; Reis, Harry T.; Gruen, Joan & Wolff, Ellen. (Pontificia U Catolica de São Paulo, Brazil) **The "eye of the beholder": Determinants of physical attractiveness judgments in the U.S. and South Africa.** *Journal of Personality*, 1974(Dec), Vol 42(4), 528-542.—Investigated determinants of ratings made of male and female "looks" and "sex appeal." It was predicted that while male and female judges would give the same mean ratings to stimulus persons shown on color slides, these ratings would have different meanings depending upon the sex of the judge and of the stimulus person. It was further hypothesized that judges high in self-regard and those who date more frequently would rate stimulus persons more positively than judges low in self-regard and dating frequency. 58 male and 74 female university students serving as judges did give the same mean ratings to the stimulus persons. Factor analyses of self-ratings and ratings of the stimulus persons on attractiveness and other dimensions showed only slight differences in self-ratings but larger differences, across raters of both sexes, in how male and female stimulus persons were evaluated. Self-regard correlated positively with ratings made by males and females of female sex appeal. Dating frequency correlated negatively with ratings made by males of both male and female sex appeal and male looks. Findings generally parallel those found by S. J. Morse et al (1974) in South Africa, with results of both studies suggesting that (a) males and females subscribe to the same standards in judging physical attractiveness but nevertheless attach somewhat different meanings to such judgments; (b) judging a male as attractive means something quite different from judging a female as attractive regardless of the sex of the judge; and (c) self-regard and dating frequency affect a judge's assessment of another person's attractiveness, but in a complex way.—*Journal summary.*

9533. Moscovici, Serge & Néve, Patricia. (Ecole Pratique des Hautes Etudes, Paris, France) **Studies in social influence: II. Instrumental and symbolic influence.** *European Journal of Social Psychology*, 1973, Vol 3(4), 461-471.—Offers a critical analysis of information-

al influence, attempting to demonstrate that in every interaction the judgments emitted by the source (influence agent) appear to contain information about the judged object. Instrumental influence is distinguished from symbolic influence. 44 female Ss from the University of Paris participated in an experiment in which they judged the number of points appearing on slides. Results show that compliance with someone who is systematically consistent is viewed by S as an adoption of that person's judgments. Compliance with someone whose consistent behavior is contingent is viewed by S as the result of the S's influence on the other person. The psychological significance of one's behavior depends on how one perceives the behavior of the influence source and what causal attributes are imputed to it.—*M. K. Phifer.*

9534. Nelson, Carnot E. (U South Florida) **The perceived structure of social attitudes.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 449-451.—In an attempt to determine the multidimensional structure of perceived social attitudes, 45 college students described approximately 10 different persons they knew by selected attitude statements from a list which the E supplied. A measure of statement concurrence for each pair of statements was derived from these data and was used in J. B. Kruskal's (1964) multidimensional scaling program. The fit for the 3-dimensional configuration fell in the "fair" range with additional dimensions adding little to the goodness of fit. This configuration was interpreted by finding axes in the configuration which corresponded to independently measured psychological properties of the statements. These axes were located by multiple-regression techniques. Liberal-conservative and moderate-extreme provided a satisfactory description of 2 of the 3 dimensions. The 3rd dimension was uninterpretable. (16 ref)—*Journal abstract.*

9535. Newton, Darren & Czerlinsky, Thomas. (U Virginia) **Adjustment of attitude communications for contrasts by extreme audiences.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 829-837.—Conducted 4 experiments to study shifts in communications of attitude when Ss were instructed to communicate accurately their opinions to extreme audiences. In the 1st experiment, 26 moderates on the Vietnam war were asked to communicate their position to both hawks and doves; communications were significantly displaced toward the audiences. Exp II replicated this effect with a between-Ss design (96 Ss) with the issue of political liberalism-conservatism. Ss were not preselected for initial position. In Exp III, 30 Ss communicated their political position to 1 extreme audience. Expected audience perception was then assessed when (a) the communication only was shown to the opposite extreme, (b) both the communication and the original audience were shown to the opposite extreme, and (c) the original audience received the communication. Expected perception was virtually identical under (b) and (c). In Exp IV, 30 Ss were shown a communication to an extreme audience. Results indicate that perceived communicator position was significantly "corrected" away from the position of the extreme audience. It is concluded that such shifts occur through context effects on the meaning

to the communicator of his attitude expressions.  
—*Journal abstract.*

9536. **Oswalt, Robert M.** (Skidmore Coll) **Person perception: Subject-determined versus investigator-determined concepts.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 281-285.—Elicited S-determined words from 8 undergraduates with the use of 4 methods over 4 sessions. These words were compared to standard investigator-determined word lists traditionally used in person perception. Results indicate that free-response methodology was feasible in person perception research, and that this technique enabled an S to identify referents with a high degree of accuracy. Comparisons between S-determined word lists and investigator-determined word lists indicate that the median overlap was small (about 12%), and it is suggested that researchers be cautious in assuming that they are equivalent.—*Journal abstract.*

9537. **Panferov, V. N.** (Leningrad State U, USSR) **[The perception and interpretation of personal appearance.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 59-64.—Reviews 3 studies of person perception conducted between 1967 and 1969, which showed, among other things, that in tachistoscopic exposures of photographs the most discriminable feature is the hairstyle. That feature and others are used in attributing personality qualities to persons before actual personal relationships begin. The process of transition from perceptual qualities to cognition and logical inferences is described and the role of physical attributes of persons in their perception by others is discussed. (English summary)—*L. Zusne.*

9538. **Posavac, Emil J.** (Loyola U, Chicago) **Relative weighting of positive and negative information and confidence in reports of behavioral intentions.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 481-483.—Trait descriptions that varied in polarity from a neutral description were formed in order to compare the relative weights of positive and negative traits on reports of behavioral intentions (BIs). 44 college students made marital BI judgments, and 82 reported employ BIs. Negative traits were weighted more heavily than positive traits. Confidence in BI reports increased as the descriptions increased in polarity, but negative information did not consistently evoke more confidence than positive information. Hypotheses suggesting different patterns of responses to marital and employ BIs were not supported.—*Journal abstract.*

9539. **Reingen, Peter H.** (Iona Coll, Graduate School of Business) **Phenomena of shifts along a risk dimension tested with established groups.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 295-296.—Conducted a study of 35 introductory business students to investigate the negative relationship between the amount of risky shift and the degree of perceived risk. Results indicate that there were no significant shifts in either the low-risk or high-risk situation.

9540. **Scarpetti, William L.** (Florida State U) **Autonomic concomitants of aggressive behavior in repressors and sensitizers: A social learning approach.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 772-781.—20 male repressors and 20 male sensitizers (selected from 200 undergraduates who completed Byrne's Repression-Sensitization scale) were placed in a 2-person interaction paradigm with a male confederate.

They were divided into 2 groups which either met their confederate (contact condition) or did not (no-contact condition). Electrodermal and plethysmographic readings were continuously recorded. Responses were either token reward or shock. Results indicate that when reward and shock counterresponses to aggressive provocation were not systematically reinforced, repressors made fewer aggressive (shock) counterresponses than reward responses. Sensitizers preferred to respond to aggressive provocation with aggressive counterresponses. Autonomic concomitants of the interpersonal behavior were highly consistent with the behavior preferred by both sensitizers and repressors. When the nonpreferred counterresponse to aggressive provocation was systematically reinforced, a reversal of these response patterns obtained. Finally, when reward and shock counterresponses were again randomly reinforced, previous response patterns and autonomic concomitants were reestablished. A social learning explanation of cathartic reactions in repressors and sensitizers is discussed.—*Journal abstract.*

9541. **Scott, Joseph A.** (California State U, Chico) **Awareness of informal space: A longitudinal analysis.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 735-738.—Identified the grade level at which children become aware of the meaning of interpersonal distance. Photographs showing pairs of adults at intimate, personal, social, and public distances were shown to 80 elementary school children. The Ss, in kindergarten through 3rd grade, were asked which of 4 communications corresponding to the above distances were in progress: a secret, discussion of dinner, directions to a store, or a call to dinner. Success in identifying the type of communication was directly related to grade level. Kindergartners performed at chance level, but success in identification increased thereafter through 3rd grade. However, the meanings of the 4 distances were not learned all at once. Public distance was identified earliest, intimate distance next, with the intermediate distances being identified last.—*Journal abstract.*

9542. **Shaffer, David R. & Wegley, Carol.** (U Georgia) **Success orientation and sex-role congruence as determinants of the attractiveness of competent women.** *Journal of Personality*, 1974(Dec), Vol 42(4), 586-600.—Proposed that competent women are attractive to the extent that they retain a feminine sex-role perspective and are not strongly motivated to compete successfully with men in masculine activities. 48 male and 48 female undergraduates were provided information describing 1 of 4 competent female strangers. Stimulus persons (SPs) were portrayed as either success-oriented or non-success-oriented and as either masculine or feminine in their sex-role preferences. Results indicate that SPs attributes were correctly perceived, but the attraction data provided only partial support for the hypotheses. As expected, Ss viewed the feminine SP as more socially attractive and more attractive as a work partner than the masculine SP. However, when taking the role of a prospective employer, Ss showed a slight preference for the masculine SP. Contrary to expectations, the success-oriented SP was not judged less attractive in general than the non-success-oriented SP. Results suggest that the aspiring career woman might well adopt a masculine sex-role preference

to impress her employer, but that she does so at the risk of some degree of social ostracism from peers of both sexes.—*Journal summary.*

9543. Shrauger, J. Sidney & Patterson, Marion B. (State U New York, Buffalo) **Self-evaluation and the selection of dimensions for evaluating others.** *Journal of Personality*, 1974(Dec), Vol 42(4), 569-585.—Exposed relationships between 36 high and 36 low self-esteem undergraduates' (as determined by scores on a self-esteem inventory) satisfaction on certain personality dimensions, the relevance they ascribed to these dimensions for judging themselves, and the frequency with which they used these dimensions in writing free descriptions of other people. Dimensions seen as highly relevant for describing oneself were used more frequently in describing others than were dimensions seen as least relevant for self-description. There were also differences in the frequency of using high- and low-satisfaction dimensions. These differences were related to the self-esteem level of the S and the likeability of the stimulus person, however, and were not significant in covariate analyses which controlled for variations in the frequency with which people in general use different dimensions. The high self-esteem S also showed more correspondence between his ratings of the relevance of dimensions to himself and his satisfaction on those dimensions. (17 ref)—*Journal summary.*

9544. Shulghina, B. A. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[Some characteristics of the acceptance by school children of a peer's opinion in a conflict situation.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 145-149.—Replicated the conformity experiment of Ash with 252 students. It was found that a variety of motives, rather than only one, lead to conformity or nonconformity to majority opinion.

9545. Skotko, Vincent; Langmeyer, Daniel & Lundgren, David. (U Cincinnati) **Sex differences as artifact in the Prisoner's Dilemma game.** *Journal of Conflict Resolution*, 1974(Dec), Vol 18(4), 707-713.—Investigated the hypothesis that sex differences in the Prisoner's Dilemma (PD) game are in part a function of the sex of the E. It was noted that female S pairs have often been found to compete more than either male pairs or mixed sex pairs in the PD game. Ss were 67 male and 67 female undergraduates. 3 males and 3 females served as Es. The hypothesis was supported; although females evidenced higher competition with male Es, no sex differences were found with female Es. Female S pairs were, however, the only pairs which evidenced significant differences in level of competition under male and female Es ( $p < .05$ ). Results are discussed in terms of greater sensitivity on the part of female Ss than male Ss to characteristics of both partner and the E. Implications for the design of experimental investigation of sex differences are also considered.—*Journal abstract.*

9546. Snyder, Mark & Cunningham, Michael R. (U Minnesota, Lab for Research in Social Relations, Minneapolis) **To comply or not comply: Testing the self-perception explanation of the "foot-in-the-door" phenomenon.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 64-67.—Conducted a field experi-

ment to test the self-perception explanation of the "foot-in-the-door" phenomenon of increased compliance with a substantial request after prior compliance with a smaller demand. In this study, 30 Ss were first approached with a small request (answer 8 questions in a telephone survey) the size of which was virtually certain to guarantee compliance. 32 other Ss were first approached with a request sufficiently large to guarantee noncompliance (answer 50 questions). Ss in both of these conditions were subsequently approached with a moderately sized request (30 questions sponsored by a different public service organization). As predicted by self-perception theory, Ss in the small-initial-request condition showed a higher rate of compliance to the 2nd request (.519), whereas Ss in the large-initial-request condition showed a lower rate of compliance (.219) than Ss in the no-initial-request control condition (.333).—*Journal abstract.*

9547. Stewart, Robert A.; Powell, Graham E. & Tutton, S. Jane. (U London, Inst of Psychiatry, England) **Subjective factors in social stereotyping and impression formation.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 867-871.—Evaluated the process of stereotyping (i.e., forming judgments from limited cues) by both the coefficient of concordance ( $W$ ) and the mean intercorrelation between antonyms ( $r$ ). In the context of the study,  $W$  reflects social stereotyping while  $r$  reflects a combination of social and individual stereotyping. 50 undergraduates ranked 6 female physiques from those most-suited to those least-suited each of 15 traits. Embedded randomly within the 15 traits were 3 pairs of antonyms. In all 3 cases  $r$  was of greater magnitude than  $W$ , suggesting that  $r$  is a more accurate estimator of total stereotyping than is  $W$ . In terms of variance explained,  $r$  was approximately twice the magnitude of  $W$ , implying that measures such as  $W$ ,  $\chi^2$ , and analysis of variance, which ignore subjective factors, greatly underestimate stereotyping. The same problem exists in impression formation, where tests such as analysis of variance may, by excluding subjective factors, underestimate the potency of target-persons and traits. It is also noted that factor analysis and related techniques were potentially immune from these distortions.—*Journal abstract.*

9548. Swingle, Paul G. (U Ottawa, Ontario, Canada) **The effects of game structure and S's behavior on attitudes toward cooperative opponents.** *Journal of Conflict Resolution*, 1974(Dec), Vol 18(4), 714-725.—Examined, in 2 experiments, the effects of game structure and S's behavior on attitudes to opponents (Os). Ss were 18 male undergraduates in Exp I and 16 females against programed Os in Exp II. Highly cooperative Ss, involved in either the Prisoner's Dilemma game, the power game, or the Chicken game, against a conditionally cooperative O, rated powerful Os as having more suspicious motives and less ability as compared to Os in the other games. Os in the Chicken game were rated least attractive. In the 2nd study, a relationship was found between weak Ss' level of exploitation and the rating of the powerful Os' ability. (29 ref)—*Journal abstract.*

9549. Taylor, Shelley E. (Yale U) **On inferring one's attitudes from one's behavior: Some delimiting conditions.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 126-131.—Determined conditions

under which people infer their attitudes directly from their behavior. 72 female undergraduates were given false physiological feedback which was either consistent or inconsistent with a prior attitude. In addition, Ss either expected or did not expect the attitude to have important consequences for their future behavior. When attitudes were reassessed, type of feedback was only weakly related to use of feedback as a basis for one's attitude. However, it was clear that Ss used the feedback as a basis for their attitude only when they expected no future consequences to result from their attitudes. When future consequences were anticipated, Ss engaged in a critical, time consuming reevaluation of their attitudes in which feedback played a minimal role. It is concluded that the process outlined by D. J. Bem's (1972) self-perception theory is most likely to operate when the attitudinal issues are relatively unimportant.—*Journal abstract.*

9550. Tesser, Abraham & Johnson, Robert. (U Georgia) **Dependence and thought as determinants of interpersonal hostility.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 428-430.—Conducted a study of 48 male undergraduates to investigate the hypothesis that thought tends to make attitudes more extreme (by making relevant cognitions more consistent) and that dependence on another tends to focus one's thoughts on that other. It was predicted that attitudes toward an initially disliked other would become more negative as a function of opportunity for thought, dependence on other, and opportunity by dependence. Dissonance theory leads to an opposite prediction: Attitudes would become less negative as a function of opportunity, dependence, and opportunity by dependence. Although results are not completely consistent with either prediction, they were better accounted for by the first prediction.—*Journal abstract.*

9551. Weigel, Russell H.; Vernon, David T. & Tognacci, Louis N. (Amherst Coll) **Specificity of the attitude as a determinant of attitude-behavior congruence.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 724-728.—113 persons who had reported varying degrees of ecological concern in a survey about environmental problems were contacted 5 mo later by representatives of the Sierra Club. Respondents' subsequent level of behavioral commitment to the Sierra Club was compared to the scores that they had previously attained on 4 different attitude scales. Results lend support to the proposition that attitude-behavior congruence improves when the attitude measured is highly specific to the behavioral criterion.—*Journal abstract.*

9552. Wilke, Henk & Meertens, Roel. (State U Groningen, Netherlands) **Individual risk taking for self and others.** *European Journal of Social Psychology*, 1973, Vol 3(4), 403-413.—Conducted 3 risk-taking studies which involved 150 Ss from the State University of Groningen and used the choice-dilemma situations of Kogan and Wallach (1964), the Pruitt and Teger gambling situation (1969), and a simple 1-trial gambling game. Results suggest that an individual takes as much risk for himself as for someone else. An attempt was made to determine to what extent the results could be

explained by properties of the experimental situations. (16 ref)—*Journal abstract.*

9553. Wyer, Robert S. (U Illinois) **Direct and indirect effects of essay writing and information about other persons' opinions upon beliefs in logically related propositions.** *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 55-63.—Sets of three propositions (A, B, and C) were selected. In each set, B was more likely to be true if A was true than if A was false, and C was more apt to be true if B was true than if B was false. After receiving information that other persons either agreed or disagreed with B, 128 undergraduates wrote an essay either supporting or opposing this proposition. Both essay writing and others' opinions affected beliefs that B was true ( $P_B$ ) in the direction of the position advocated. Effects of these variables upon beliefs that C was true ( $P_C$ ) were in the same direction but less in magnitude. Essay writing affected beliefs that A was true ( $P_A$ ) only when Ss were told that other persons agreed with B. Changes in  $P_A$  and  $P_C$  did not depend upon whether A and C were mentioned in the essays about B. Changes in beliefs were attributed to a tendency for Ss to regain cognitive consistency. (26 ref)—*Journal abstract.*

9554. Zillmann, Dolf & Bryant, Jennings. (Indiana U, Inst for Communication Research) **Effect of residual excitation on the emotional response to provocation and delayed aggressive behavior.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 782-791.—In a pretest with 20 male undergraduates, the excitatory response to 2 equally liked tasks—disc threading and bike riding—was assessed in peripheral indices. Bike riding induced substantial excitatory elevation; disc threading yielded negligible changes only. Sympathetic arousal was significantly differentiated 2 min after the tasks. 6 min after the tasks, residual excitation from the bike task had decayed so that arousal from the 2 tasks no longer differed. In the main experiment, 43 Ss performed 1 of the 2 tasks, and 2 min thereafter (experiencing minimal vs high residual excitation) they were either treated in a neutral manner (no provocation) or aggressively instigated (provocation) by an opponent. 6 min after completion of the task (after decay of task-produced residues), Ss were given an opportunity to behave aggressively and/or benevolently toward their opponent. Pronounced residual excitation at the time of provocation increased delayed aggressiveness significantly. Findings are consistent with 2-factor and excitation-transfer theories of emotion. (16 ref)—*Journal abstract.*

9555. Zillmann, Dolf & Cantor, Joanne R. (Indiana U, Inst for Communication Research) **Rhetorical elicitation of concession in persuasion.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 223-236.—Conducted a study of 52 undergraduates to assess the persuasive effect of the rhetorical elicitation of concession under conditions of initially favorable and initially unfavorable attitude relative to the attitudinal position advocated; the resulting resistance to counterpersuasion was also measured. Elicitation of concession resulted in a significant increase of persuasiveness under conditions of favorable attitude, and in a significant decrease of persuasiveness under conditions of unfavorable attitude. Various rationales are developed, and their respective predictive accuracy discussed. A model based mainly on the

enhancement of cognitive involvement is evaluated as best accounting for the findings obtained.—*Journal abstract.*

## COMMUNICATION AND LANGUAGE

9556. Blankenship, Ralph L. (Virginia Commonwealth U) **Caserecords language: Toward a sociolinguistic perspective on deviance labeling.** *Sociology & Social Research*, 1974(Apr), Vol 58(3), 253-261.—Caserecords register and language choice are means by which agents of social control construct selective images of reality which, in the place of a subject person, function as bases for putting offenders into appropriate social settings for treatment and custody. Contextualization of caserecords on the situational and linguistic levels reveals (a) that linguistic variation is related to convergent influences in the social setting where caserecords are constructed and differential labeling outcomes are decided, and (b) that caserecords writers can portray functionally distinctive deviance types through common techniques of management and descriptive lexis, form, and style. Meaning, in caserecords, is affected by manipulative intent, power, and collusive agreement. (15 ref)—*Journal abstract.*

9557. Bourhis, Richard Y.; Giles, Howard & Taffel, Henri. (University Coll, Cardiff, Wales) **Language as a determinant of Welsh identity.** *European Journal of Social Psychology*, 1973, Vol 3(4), 447-460.—Carried out a study using the "matched-guise" technique to determine how different groups of Welshmen perceive members of their own national group who use various linguistic codes. 3 matched groups of adult Welsh Ss were (a) bilinguals, (b) those who were learning Welsh, and (c) those who could not speak Welsh and were not learning it. Ss were asked to evaluate on 22 scales the personalities of speakers they heard reading the same prose passage on tape in Welsh, in English with a Welsh accent, and in English with a received accent. Results show that Ss as a whole upgraded the speakers on most traits when Welsh was used. It is suggested that language serves as a symbol of Welsh identity, and the results are discussed in relation to how other ethnic groups appear to view their own linguistic codes. (28 ref)—*Journal abstract.*

9558. Carpenter, Patricia A. & Just, Marcel A. (Carnegie-Mellon U) **Sentence comprehension: A psycholinguistic processing model of verification.** *Psychological Review*, 1975(Jan), Vol 82(1), 45-73.—Presents a theoretical account of certain aspects of sentence comprehension, particularly the processes involved in deciding whether a sentence is true or false. The model proposes that (a) sentences are internally represented as an ordered set of constituents in an abstract propositional format, (b) other information sources (e.g., pictures) may be represented in a similar format in this task, and (c) the corresponding constituents from the sentence representation and the picture representation are serially compared. The predictions are made on the basis of a single parameter—the time to find and compare one pair of constituents. The model also accounts for verification of counterfactual clauses, implicit negatives, universal

and particular quantifiers, and sentence recoding. (50 ref)—*Journal abstract.*

9559. Cassis, A. F. (U Lethbridge, Alberta, Canada) **The dream as literary device in Graham Greene's novels.** *Literature & Psychology*, 1974, Vol 24(3), 99-108.—Describes the development of the usage of dreams in novels by Graham Greene. Dreams are used both as a literary device to reveal levels of his characters' unconscious and as a thought-process substitute.

9560. Chakrapani, T. K. (Aiyars Advertising & Marketing Private Ltd, Bombay, India) **Estimation of missing values and analysis of incomplete experiments in consumer behaviour research.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 89-93.—Observers that complete data often is not obtainable in certain types of psychological research. Formulas are presented for both orthogonal and nonorthogonal designs to handle situations in which the data from either 1 plot or more than 1 plot is missing. Examples are provided which illustrate application of the various formulas.—*B. Lindsey.*

9561. Cowan, James C. (U Arkansas) **Dream-work in the Quentin section of *The Sound and the Fury*.** *Literature & Psychology*, 1974, Vol 24(3), 91-98.—Describes William Faulkner's literary use of dream work in *The Sound and the Fury*. His use of the principles of dream symbols, displacement, condensation, preconscious association, Oedipal conflict, and the Freudian death wish are discussed as essential to his stream-of-consciousness writing style.

9562. Edelstein, Alex S. & Tefft, Diane P. (U Washington) **Media credibility and respondent credulity with respect to Watergate.** *Communication Research*, 1974(Oct), Vol 1(4), 426-439.—Administered an open-ended opinion questionnaire on Watergate to 575 Ss in a random sample of the Longview, Washington, household population. Results indicate a shift away from disbelief regarding Watergate-related events, and toward a focus on "actors" (officials involved and the media). The source credibility of the media was not a focus of attention; rather President Nixon was a major focus of incredulity. Data confirmed the Ss' reluctance to believe elected officials capable of unlawful acts rather than an expectation of such acts from White House officials. The study extends research on "source credibility" from an interpersonal to a mass communications setting. It stresses the need for concern with the capacity of media users to believe and disbelieve and for the nature of events creating credulity. (23 ref)—*R. Tomasko.*

9563. Faber, M. D. (U Victoria, British Columbia, Canada) **Othello: Symbolic action, ritual and myth.** *American Imago*, 1974(Sum), Vol 31(2), 159-205.—Suggests that the actions of Othello are indications of a traumatic reactivation of repressed infantile feelings of ambivalence toward his mother.

9564. Florence, Jean. [Psychoanalysis-literature.] (Fren) *Revue de Psychologie et des Sciences de l'Education*, 1974, Vol 9(2), 209-229.—The hyphen in the title has often represented a war between psychoanalysis and literature; the first has been charged with demeaning and vulgarizing the latter and of having displaced fantasy literature. However, the hyphen may represent a bond between the two. Freud saluted the poetic insights which

anticipated psychoanalysis in their comprehension of the action of heroes. He acknowledged the influence of Boerne and Goethe, and the influence of Sophocles, Shakespeare, and Dostoevsky on his work is evident. If psychoanalysis displaces fantasy literature it is because it exposes the truth about the human concern with life and death, even though the truth may not be pleasant.—S. S. Marzolf.

9565. Gajdusek, R. E. **Death, incest, and the triple bond in the later plays of Shakespeare.** *American Imago*, 1974(Sum), Vol 31(2), 109-158.—Discusses the presence of mythic female figures representing life, love, and death in Shakespeare's later plays (e.g., *Pericles*, *King Lear*, *Coriolanus*). It is suggested that Shakespeare's later works reveal symbolically his unconscious adjustment to mortality and approaching death.

9566. Gardiner, Judith K. (U Illinois, Chicago Circle) **Infantile sexuality, adult critics, and Bartholomew Fair.** *Literature & Psychology*, 1974, Vol 24(3), 124-132.—Presents a psychoanalytic interpretation of Ben Jonson's *Bartholomew Fair*. The audience's attraction to the play is explained by their unconscious association with its several Oedipal triangles.

9567. Gormley, Richard. **A note on seven brand rating scales and subsequent purchase.** *Journal of the Market Research Society*, 1974(Jul), Vol 16(3), 242-244.—Examined the relationship of ratings of a national bread brand to subsequent purchase of the bread in 4 US cities. Consumers' ratings of the brand on all 7 scales correlated positively with the number of purchases of the brand made by the same consumers, and "intent to buy" produced the highest positive correlation with subsequent number of brand purchases.

9568. Green, Paul E. & Devita, Michael T. (U Pennsylvania, Wharton School) **A complementarity model of consumer utility for item collections.** *Journal of Consumer Research*, 1974(Dec), Vol 1(3), 56-67.—Describes a model that portrays certain types of interactions and main effects in consumer evaluation tasks. The model is illustrated with menu preference data, and its potential use in other types of multiattribute choice situations is described. Additive and vector models of preference data for item collections are examined, and a combination of these 2 models is proposed which emphasizes commonalities between 2 classes of items (e.g., entrees and desserts); complementarity increases or decreases monotonically with changes in each dimension. The model was tested with 30 business students who evaluated 45 combinations of 5 entrees and 9 desserts on a 9-point personal preference scale. After 1 hr, S received 15 replicate menus (of the original 45) for further rating. Results suggest that (a) contrary to expectations, most respondents did not exhibit highly interactive utilities with regard to the stimulus set used here; (b) of the few (12 of 27) Ss who did, the relative magnitude of the interaction numbers was small; and (c) the model does an adequate job in depicting positive and negative complementarities. Extensions of the model to prediction problems and multi-way matrix analysis are discussed.—L. Gorsey.

9569. Henson, Ramon. (Wayne State U) **Effects of instructions and verbal modeling in a survey interview setting.** *Social Science Research*, 1974(Dec), Vol 3(4),

323-342.—Evaluated the effects of 2 interviewing procedures, instructions and verbal modeling, on the reporting of health information in a survey interview setting. The theoretical basis for selecting these procedures was derived from a conceptualization of the cognitive requirements for effective reporting. 2 main dependent variables were used: number of health conditions reported, and number of ideas reported. An experimental sample design was employed, with the sample restricted to 18-64 yr old white females living in a large metropolitan area. Results indicate various mediating effects of educational level and subjective health rating. Implications for research on interviewing methodology, as well as on the cognitive and motivational aspects of reporting performance, are discussed. (37 ref)—*Journal abstract*.

9570. Hillman, Judith S. (Johnson State Coll) **An analysis of male and female roles in two periods of children's literature.** *Journal of Educational Research*, 1974(Oct), Vol 68(2), 84-88.—Identified and analyzed sex-role standards attributed to characters in children's books. The sample of 120 books, selected for an audience of children aged 8-13 yrs, represented 2 temporal periods (the 1930s and the mid-1960s to mid-1970s) equally. A comparison indicated that (a) males were more numerous than females in both the early period and the recent period, (b) the range of occupations for males was much broader than for females, and (c) 8 of the 17 behavioral categories remained constant while 9 changed from period to period. Specifically, males were shown to be physically aggressive and competent in both periods, and females retained the characteristics of affiliation-dependence and sadness. However, aspects of masculinity and femininity that conform to stereotypic traits were more prevalent in the early than in the recent period, thus denoting an increasing latitude of sex-role standards over the 3 decades. (18 ref)—*Journal abstract*.

9571. Holm, John; Kraus, Sidney & Bochner, Arthur P. (Cleveland State U) **Communication and opinion formation: Issues generated by the Watergate hearings.** *Communication Research*, 1974(Oct), Vol 1(4), 368-390.—A 500-person random sample was drawn from listings in the Cleveland telephone directory. 116 of these Ss were interviewed 3 times. Cross-lag analysis was used to examine the associations among the interpersonal communication variables. A contingent orientations approach was used to measure the effects of political cross-pressure, government trust, and perception of power distribution in American society on the impact of media usage. Results indicate that President Nixon's general negative image resulted in increased interpersonal communication about Watergate issues which finally led to specific negative opinions toward Nixon. Selective perception appeared most strikingly among Ss whose opinion bias was most threatened by political communication. Ss with pluralistic views of power distribution changed their opinion on presidential credibility issues to a much greater extent than Ss with elitist perspectives.—R. Tomasko.

9572. Humphrey, N. K. (U Cambridge, England) **The illusion of beauty.** *Perception*, 1973, Vol 2(4), 429-439.—Discusses fundamental questions concerned with the biology of aesthetics. An attempt is made to define the

particular quality which things of beauty have in common and to explain man's search for the essence of beauty in classifying the relations formed between the perceived elements. (16 ref)

9573. Ivie, Robert L. (Idaho State U) **Presidential motives for war.** *Quarterly Journal of Speech*, 1974(Oct), Vol 60(3), 337-345.—Examined war addresses by 7 US Presidents in 7 foreign wars with respect to the terms used. The Presidents uniformly stress the duty of Americans to protect the territorial, commercial, and neutrality rights of their country and their individual rights to freedom. America's enemies are characterized as lawless, tyrannical, uncivilized, and undemocratic. The addresses call for war only as a last resort after protest, diplomacy, and neutrality have failed, and warn that failure to act forcefully often only encourages the enemy to continue his acts of aggression. American Presidents are seen as so attached to this moralistic terminology that their perception of reality is determined by it, rather than vice versa.—H. Ruja.

9574. Kirkland, John. (U Missouri) **Interest and aesthetic pleasure: Support for the inverse-effect.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 882.—20 undergraduates viewed randomly generated polygons which varied in complexity under instructions which emphasized either the "aesthetic pleasure" or "interestingness" of the polygons. The inverse effect, in which Ss prefer complex to simple figures when instructed to view for "interestingness" but reverse this preference for "pleasingness," was supported.

9575. Kloss, Robert J. (William Paterson Coll) **Chaucer's *The Merchant's Tale*: Tender youth and stooping age.** *American Imago*, 1974(Spring), Vol 31(1), 65-79.—Discusses the symbolic expressions of the character January's infantile sexual fantasies and desires. The infantile nature of January's attitudes toward women and marriage is examined.

9576. Lackner, James R. (Brandeis U) **Speech production: Evidence for corollary-discharge stabilization of perceptual mechanisms.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 899-902.—12 Ss participated in an experiment which demonstrated that a syllable one repeats aloud to himself will remain perceptually stable; nevertheless, if one then listens to a tape-recording of his own repetitions of the syllable, then he will hear it undergo transformations. Apparently, during the self-production of a speech sound, the perceptual mechanisms involved in its reception are alerted for that particular linguistic entity, and as a consequence perceptual stability is maintained.—Journal abstract.

9577. Larson, Charles U. (Northern Illinois U) **A content analysis of media reporting of the Watergate hearings.** *Communication Research*, 1974(Oct), Vol 1(4), 440-448.—Examines 332 segments of the Watergate hearings as reported by 3 commercial television networks and 2 newspapers. Media bias, gatekeeping, intermedia relations, and the tendency of the media to cast events into dramatic episodes are considered.

9578. Leak, Gary K. (U Nebraska, Lincoln) **Effects of hostility arousal and aggressive humor on catharsis and humor preference.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 736-740.—Tested 3 hypotheses, derived from psychoanalytic theory, regard-

ing humor and catharsis following a hostility arousal manipulation. The experiment was a 2 x 2 factorial design with 2 levels of hostility arousal (high and low) and aggressive humor (presence or absence), with a group factor nested within arousal. 112 undergraduates served as Ss. As predicted, aroused Ss given aggressive humor rated the E significantly less negatively than aroused Ss not given the aggressive humor. However, contrary to expectation, aroused Ss did not show an increased preference for either hostile or racial wit jokes when compared to nonaroused controls. The evidence above for a catharsis effect is discussed with reference to the conflicting results of previous catharsis studies. (16 ref)—Journal abstract.

9579. Lehmann, Donald R.; O'Brien, Terrence V.; Farley, John U. & Howard, John A. (Columbia U, Graduate School of Business) **Some empirical contributions to buyer behavior theory.** *Journal of Consumer Research*, 1974(Dec), Vol 1(3), 43-55.—Examined a comprehensive buyer-behavior model in the context of a test market study. The investigation was a longitudinal study of the introduction of a new, frequent purchase product in Argentina; data were collected by personal interviews with 200 persons in 2 cities, which were conducted in 3 waves, each 6 wks apart, 1 before and 2 after the introduction of the product. The analysis used both full-model cross-sectional and longitudinal procedures. The model, which includes 3 major components derived from the behavioral sciences information processing or perceptual, cognitive attitude formation (i.e., learning), and choice components was most reliable for equations involving attention, brand comprehension, attitude, and satisfaction. Suggested revisions for the model, detailed examinations of cross-sectional and longitudinal data, and specific implications of the model for buyer-behavior model building are discussed (31 ref)—L. Gorsey.

9580. LeRoy, David J.; Wotring, C. Edward & Lyle, Jack. (Florida State U) **The public television viewer and the Watergate hearings.** *Communication Research*, 1974(Oct), Vol 1(4), 406-425.—Investigated audience opinions and viewing patterns of those watching the gavel-to-gavel TV coverage of the Watergate hearings. 1,466 interviews were conducted in Tallahassee, Jacksonville, Miami, and Tampa St. Petersburg, Florida, to determine characteristics of the Public TV viewer. Blacks watched in greater proportion than whites and males watched more than females. A college education increased the probability of watching. Spanish-speaking Ss rarely watched the hearings. One-third of the audience were new to Public TV. Public TV viewers were the most sensitive to the positions of different political groups on Watergate, and more likely to have views themselves than non-Public TV viewers. Their opinions were less likely to remain supportive of the White House as the hearings progressed. The experiential implications of "TV of record" on the Ss are considered.—R. Tomasko.

9581. Levin, Gerald. **Swinburne's "end of the world" fantasy.** *Literature & Psychology*, 1974, Vol 24(3), 109-114.—Describes Swinburne's poetic use of the "end of the world" fantasy, first identified by Freud as a form of paranoid delusion. Poems discussed include "Laus Veneris" and "The Triumph of Time."

9582. Murray, Edward L. **Language and the integration of personality.** *Journal of Phenomenological Psychology*, 1974(Spr), Vol 4(2), 469-489.—Discusses the role of language as an integrator of human personality and describes the reflections of this language function which are apparent in the psychoanalytic process. Language serves not only as an instrument of pragmatic communication about the world but also acts to unify, structure, and give meaning to the individual's interactions with himself and with the world. The patient who seeks psychotherapy because of feelings of personal disintegration and alienation must abandon the stereotyped language of everyday discourse and attempt to unify and express his personality by using idiosyncratic forms of expression. It is suggested that metaphors, symbols, and personal myths help the psychotherapeutic patient to go beyond the finite character of ordinary language to express the uniqueness of his personality. —J. Kelly.
9583. O'Donnell, Bruce. (U Louvain, Belgium) **Language in catechetics.** *Religious Education*, 1974(Sep-Oct), Vol 69(5), 542-557.—Discusses religious language—its differences from the language of empirical knowledge, its function in certain areas and situations, its weaknesses, and its possible improvement through greater use of the language of the media.
9584. O'Keefe, Garrett J. & Mendelsohn, Harold. (U Denver) **Voter selectivity, partisanship, and the challenge of Watergate.** *Communication Research*, 1974(Oct), Vol 1(4), 345-367.—Investigated factors affecting voters' communication behavior and value orientation regarding Watergate. 2,000 Summit County, Ohio, voters were interviewed in July 1972, and monthly interviews were held with subgroups before and after the November election. Reinterviews with portions of the Ss were held in May and August 1973. Pre-election questions focused on the extent to which voters were informed about the Watergate break-in and how it was expected to affect their voting. 40% of those informed of the break-in before the election believed highly placed persons in the White House were responsible. 18% of the Nixon voters reinterviewed in May said Watergate had made them less likely to vote Republican in 1974, and 17% would be less likely to vote for a Republican presidential candidate in 1976. Results indicate that Watergate failed to surface in Summit County as an urgent issue. Voters who tended to view Nixon as untrustworthy still perceived him as expert in carrying out the presidency. (16 ref)—R. Tomasko.
9585. Pickering, J. F. & Isherwood, B. C. (Administrative Staff Coll, Henley, England) **Purchase probabilities and consumer durable buying behaviour.** *Journal of the Market Research Society*, 1974(Jul), Vol 16(3), 203-226.—Hypothesized that purchase-probability statements by respondents are more likely to be informative than dichotomous statements of buying intentions. Results of a study that investigated the predictive and explanatory performance of a purchase-probability scale suggest that the low and high probability values convey quite different kinds of information and that this varies according to the nature of the product and its ownership level. (20 ref)
9586. Quinn, James & Baldessarini, Ross. (Windham Coll) **Literary technique and psychological effect in Hawthorne's "The Minister's Black Veil."** *Literature & Psychology*, 1974, Vol 24(3), 115-123.—Describes Nathaniel Hawthorne's psychological symbolism in "The Minister's Black Veil." The analysis stresses his use of a literary style which enables the reader to project his or her psychodynamics on the protagonist.
9587. Rist, Ray C. (US DHEW, National Inst of Education, Washington, DC) **The pornography controversy: Changing moral standards in American life.** New Brunswick, NJ: Transaction Books, 1975. ix, 279 p. \$3.95.—Presents a collection of 14 essays on the legal, moral, cultural, and social problems faced by those who define, defend, criticize, or control the use of sexually explicit material in the US.
9588. Robinson, John P. (U Michigan) **Public opinion during the Watergate crisis.** *Communication Research*, 1974(Oct), Vol 1(4), 391-405.—Studied the development of public opinion trends as affected by the media presentation of Watergate. Data on political and social attitudes were obtained from a 660-person cross-sectional representation of Flint, Michigan, and Toledo, Ohio. Ss were interviewed in December 1972-January 1973 to determine a "feeling thermometer" rating of political figures and institutions, perceived fairness of media, attitudes toward societal trends, and the degree that items in the media affected their everyday conversation. 3 subsamples were then reinterviewed in May-August 1973 to measure their level of attention and response to the Watergate issue and the extent of their interpersonal conversation about Watergate. Results indicate that Watergate had a negative impact on politics in general, with McGovern's public esteem falling almost as sharply as Nixon's. Public interest in Watergate waned during the course of the hearings, and no significant increase was found in the public's trust of the media.—R. Tomasko.
9589. Rousseau, Jean-Jacques. **Rousseau's account of a psychological crisis.** (Trans R. J. Ellrich). *American Imago*, 1974(Spr), Vol 31(1), 80-94.—Presents a translation of an autobiographical account of a psychological crisis found appended to the *Dialogues* of J. J. Rousseau. It is suggested that Rousseau's introspections on separateness and autonomy anticipate modern existential writings on human identity.
9590. Russo, J. Edward. (U California, San Diego) **More information is better: A reevaluation of Jacoby, Speller and Kohn.** *Journal of Consumer Research*, 1974(Dec), Vol 1(3), 68-72.—A reanalysis of the data of J. Jacoby et al (1974) shows that, in their experimental situation, consumers both wanted and benefited from more information. This analysis conflicts with the authors' conclusions.
9591. Shaw, Marvin E. & Margulis, Stephen T. (U Florida) **The power of the printed word: Its effect on the judgment of the quality of research.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 301-302.—Results of a study of 36 Ss support the hypothesis that judgments of the quality of a research report are influenced by the form of presentation.
9592. Sladen, Brenda K. (Johns Hopkins U, School of Hygiene & Public Health) **The evolution of human**

**capacity for language.** *Bulletin of the Orton Society*, 1974, Vol 24, 37-47.—Discusses the evolution of language as it relates to recent developments in anthropology, neurology, and child development. (36 ref)

9593. Smart, Reginald G. (Addiction Research Foundation, Toronto, Ontario, Canada) **Comparison of purchasing in self-service and clerk-service liquor stores.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1397-1401.—Observed purchasers of alcoholic beverages in a self-service and a clerk-service liquor store 2 days/wk, 7-9 PM, for 5 wks. The self-service store had a total of 2,101 customers (301 women) and the clerk-service store 1,888 (210 women). More bottles/customer were brought at the self-service store. The proportions of customers buying distilled spirits were similar, but significantly more of them at the clerk-service stores bought more than 1 bottle. The self-service store had more customers buying a combination of types of beverages. Interviews were obtained with a random sample of 331 customers: 18.7% said they had bought more than they had intended to. These impulse buyers did not differ from nonimpulse buyers in age, sex, or in the numbers purchasing wine and distilled spirits. Half of the impulse buyers and  $\frac{1}{4}$  of the other interviewed customers drank daily; the impulse buyers also tended to drink more on each "usual" occasion. —*Journal abstract.*

9594. Van Rooijen, Louis. (U Michigan) **Talking about the bright side . . . Pleasantness of the referent as a determinant of communication accuracy.** *European Journal of Social Psychology*, 1973, Vol 3(4), 473-478.—Investigated the pleasant-unpleasant evaluation dimension in a referential setting. Ss were 50 male and female undergraduates at the University of Michigan who read descriptions of pleasant, neutral and unpleasant facial expressions and selected from an array of photographs the one which seemed appropriate to the description. Results show that pleasantness had a strong effect on communicative accuracy. The pleasanter the facial expression, the more accurate the identification of the target of the descriptions. Women were more accurate than men in identifying pleasant facial expressions. Implications are extended to the "Pollyanna hypothesis" that there is a universal tendency to use evaluatively positive words oftener than negative ones. —*M. K. Phifer.*

9595. Westwood, Dick; Lunn, Tony & Beazley, David. **The trade-off model and its extensions.** *Journal of the Market Research Society*, 1974(Jul), Vol 16(3), 227-241.—Describes the trade-off model—a new approach to understanding and measuring consumer value systems—and illustrates ways in which it is being applied to marketing problems. The relevant literature is reviewed, and the model is discussed in terms of its use in evaluating new product ideas.

## PERSONALITY

9596. Alegre, Cecelia & Murray, Edward J. (U Miami) **Locus of control, behavioral intention, and verbal conditioning.** *Journal of Personality*, 1974(Dec), Vol 42(4), 668-681.—Selected 48 male and 48 female

undergraduates on the basis of their scores on Rotter's Internal-External Control Scale and the Marlowe-Crowne Social Desirability scale to test the relationship between locus of control and verbal conditioning with Ss who were contingency and demand aware. Verbal conditioning was greatest in external Ss, less in middle-range Ss, and least in internal Ss. Female Ss conditioned better than males. Both results were independent of social desirability. Behavioral intentions, assessed on a postexperimental questionnaire, were related to both locus of control and verbal conditioning. Results are interpreted as being consistent with J. B. Rotter's (see PA, Vol 40:2392) views about locus of control, D. E. Dulany's (1968) formulations about propositional control, and M. M. Page's (see PA, Vol 49:2366) emphasis on social compliance in the verbal conditioning paradigm. (19 ref)—*Journal summary.*

9597. Allred, G. Hugh. (Brigham Young U) **On the level: With self, family, society.** Provo, UT: Brigham Young University Press, [ND]. xvi, 358 p. \$10.95(cloth), \$6.95(paper).—Presents concepts and principles of human behavior that can be used to increase self-understanding and positive feelings towards others. Ways of relating to significant others and facilitating one's ability to work with rather than against people are described.

9598. Andrews, Rhoda & Brown, Evan. (U Nebraska, Omaha) **Firstborns, only children, sex, and three dependency measures.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 773-774.—Compared 4 groups of 7 firstborn undergraduates each (males and females with and without siblings) on versions of the Embedded Figures and rod-and-frame tests and Barron's self-endorsement test of social independence. Birth order and sex influenced field dependence, and Barron scores were not related to field dependence.

9599. Babad, Elisha Y. (Hebrew U Jerusalem, Israel) **A multi-method approach to the assessment of humor: A critical look at humor tests.** *Journal of Personality*, 1974(Dec), Vol 42(4), 618-631.—Asked all students of a women's college ( $N = 1,816$ ) to name peers who are nonhumorous, passive appreciators, active producers and/or reproducers of humor. 987 were named at least once in the Humor Categories Report, and of these 81 were selected and divided into 5 groups according to sociometric consensus of peers: Nonhumorous, Appreciators, Producers, Reproducers, and Producers-Reproducers. 77 Ss were individually administered a humor appreciation test (rating funniness of jokes and cartoons); an active humor test (producing or reproducing funny captions to cartoons); 2 creativity subtests; a self-report in humor group; a 90-item questionnaire measuring defensiveness, introversion, and anxiety; and the California Fascism Scale. Results showed the sociometric method and the humor tests to be in sharp contrast, the former invalidating the latter. Groups by self-report were closely related to grouping by sociometric consensus. The "pure type" groups were not differentiated in their scores on the humor tests. These groups differed in their anxiety and introversion in the predicted direction, but unexpectedly, the correlations between these variables and the humor test scores were positive. Creativity test scores were related only to the humor test scores. It

is argued that tests should not be used in the assessment of humor. (23 ref)—*Journal summary*.

9600. Bartlett, Maurine M. & Davis, Gary A. (U Wisconsin) **Do the Wallach and Kogan tests predict real creative behavior?** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 730.—Administered M. A. Wallach and N. Kogan's 1965 creativity test battery to 37 undergraduates. Summing across 4 tests, fluency, uniqueness, and total creativity scores correlated .33, .33, and .35 ( $P_s < .05$ ) with ratings of 4 actual creative products (poetry or a short story, artwork, ideas for 2 inventions, and a creative teaching strategy).

9601. Bleger, José [Ambiguity: A chapter from psychology and psychopathology.] (Span) *Revista de Psicoanálisis*, 1974(Jan-Jun), Vol 31(1-2), 57-79.—Discusses the concept of ambivalence as used in psychoanalytic theory, and aspects of the ambivalent personality. (52 ref)

9602. Boudreaux, Ronald & Dreger, Ralph M. (Central Louisiana State Hosp, Pineville) **Item content of the Group Personality Projective Test.** *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 551-555.—Examined the content factors of the Group Personality Projective Test (GPPT) using factor analytic procedures based on item intercorrelations, in contrast to the published version's use of part scores from a priori groupings of items. Ss were 248 psychiatric inpatients and outpatients and high school and college students (age range 16-57 yrs). The factors extracted did not coincide with the original GPPT dimensions. Only a small portion of the GPPT items loaded significantly on the factors obtained. The proportion of variance accounted for by the factor structure was also very small. Results indicate that a position response set may be affecting scores on the Neuroticism dimension. It is concluded that the GPPT, in terms of what it proposes to measure, apparently has very limited utility.—*Journal abstract*.

9603. Brehmer, Berndt. (U Umea, Sweden) **A note on the cross-national differences in cognitive conflict found by Hammond et al.** *International Journal of Psychology*, 1974, Vol 9(1), 51-56.—Replicated, using 80 university undergraduates, a 1968 study by K. R. Hammond et al that reported differences in cognitive conflict between American and Western European Ss. Results of the replication show that subtle procedural variations, rather than nationality, produced the differences.

9604. Burdsal, C. A. & Vaughn, D. S. (Wichita State U) **A contrast of the personality structure of college students found in the questionnaire medium by items as compared to parcels.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 219-224.—Administered the 16 Personality Factor Questionnaire to 264 undergraduates to examine the item structure in the measure following the analytic procedures used by R. Cattell (1966). Item data was factor analyzed, yielding essentially the same factor structure as produced by the original parceling. It is concluded that factor analytic test construction can proceed most profitably with the use of item parcels.—*Journal abstract*.

9605. Cantor, Joanne R.; Bryant, Jennings & Zillmann, Dolf. (U Wisconsin) **Enhancement of humor appreciation by transferred excitation.** *Journal of Per-*

*sonality & Social Psychology*, 1974(Dec), Vol 30(6), 812-821.—Exposed 120 undergraduates to humorous communications after reading 1 of 4 written communications which had been chosen to effect a factorial variation in (a) hedonic tone (positive, negative) and (b) excitatory potential (low, high). The differentiation of the written communications was validated by analyses of ratings given to the experimental stimuli by the Ss. Under conditions of both positive and negative hedonic tone, prior exposure to the highly arousing communications resulted in significantly higher funniness ratings of the subsequent cartoons and jokes than prior exposure to the less-arousing stimuli. (34 ref)—*Journal abstract*.

9606. Carment, David W. (McMaster U, Hamilton, Ontario, Canada) **Internal versus external control in India and Canada.** *International Journal of Psychology*, 1974, Vol 9(1), 45-50.—Administered Rotter's Internal-External (I-E) Control Scale to 63 Indian factory workers (average age 35), 98 Indian university students (average age 19), 67 Canadian semi-skilled and unskilled workers (average age 27) and 196 Canadian university students, all males. The scale was administered in its standard form to all Ss except Indian factory workers, who were given a Hindi version. Average overall scores of Canadians were significantly more external than those of Indians ( $p < .01$  for Canadian workers and  $p < .001$  for Canadian students). Canadian students were significantly more internal than Indian students on the Personal Control factor, but more external on the Control Ideology factor and on the Systems Control factor. No difference appeared for Indian and Canadian workers on Personal Control, though Canadian workers were more external than their Indian counterparts on Control Ideology and Systems Control. Results emphasize that research involving the I-E measure should take specific components into account instead of focusing on a single general attribute. (30 ref)—*E. A. Gavin*.

9607. Caruso, Igor A. (U Salzburg, Psychologische Inst, Austria) [The rational and irrational in the "We-I."] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1974(Jan), Vol 22(2), 122-131.—Notes that modern man identifies himself mainly with his ego and that this identification is not without problems. The socioeconomic structure of our society promotes the development of an isolated achievement-oriented ego. A "collective ego," a regressive offshoot of the symbiotic dyadic pre-ego, is developed as a reaction to this pressure. Ideologies also neglect the ego and subordinate it to the collective "we" without considering that the ego can develop itself within the social context only with the help of fellow men. Rational and irrational elements contribute to integrate the ego into the collective "we." These factors enter the treatment sessions and place a strain on the analyst's ego.—*S. D. Babcock*.

9608. Casey, Edward S. (Yale U) **Toward an archetypal imagination.** *Spring*, 1974, 1-32.—Examines Jung's theories of fantasy and imagination and his theory of "fourness," the 4-figured pattern representing the most persistent and stable of archetypal arrangements. G. Bachelard and M. Heidegger's systems are discussed as well as other archetypal patterns such as the polyadic. Progression is traced from conscious imaging to active

imagination to archetypal imagination, and the paradoxes that occur along the path are noted.—*A. de la Haba.*

9609. Chiozza, Luis A. [*Psychoanalytic study of hepatic fantasies.*] (Span) *Revista de Psicoanálisis*, 1974(Jan-Jun), Vol 31(1-2), 107-140.—Speculates on the possible existence of an hepatic erotogenic zone and discusses the analogies between hepatic fantasies and oral fantasies. (French & English summaries) (71 ref)

9610. Coan, Richard W. (U Arizona) *The optimal personality: An empirical and theoretical analysis.* New York, NY: Columbia University Press, 1974. x, 242 p. \$12.—Describes a method of analyzing both the theoretical and empirical aspects of the ideal personality. Various instruments specially developed for this study, including measures of personal consistency and the experience of control and data from their administration to different groups of Ss, are presented. The relationship between various independent components of sound functioning is also discussed. (4½ p ref)

9611. D'Andrade, Roy G. (U California, San Diego) *Father absence, identification, and identity.* *Ethos*, 1973(Win), Vol 1(4), 440-455.—Studied the effects of father absence during early and late childhood on sex role identification. A sample of 121 children ranging in age from 5 to 14.9 yrs was drawn from 58 black working class households. Households were divided for analysis into categories based on timing and length of paternal absence. Ss' patterns of sex identification and sex identity were measured by the Franck Test, by verbal self-descriptions, and by a role preference task. It was found that Ss who did not have a father present during the 1st 3 yrs of life exhibited a feminine response pattern on the Franck Test. It appeared that paternal absence influenced conscious sex role identity through the indirect processes of reciprocal role learning and perception of sex role advantages and disadvantages. It is concluded that household composition has an important effect on development of sex role identities and sex role preferences.—*J. Kelly.*

9612. Davis, Robert Wm. (Ed.). *Toward a discovery of the person: The first Bruno Klopfer Memorial Symposium & Carl G. Jung Centennial Symposium.* Burbank, CA: Society for Personality Assessment, [1973]. 83 p. \$4.50.—Presents a collection of symposium papers on contemporary issues in the psychological evaluation of individuals, emphasizing the work of Klopfer. Topics discussed include the interface of culture and the individual, the Rorschach and its relation to Jungian psychology, and the applicability of physical models to personality interpretation.

9613. Erić, Ljubomir. (U Belgrade, Medical Faculty, Yugoslavia) [*The effects of manifest neurotic anxiety on the academic achievement of Belgrade University students.*] (Ser) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(3), 39-49.—Compares two groups of undergraduate students, those with anxiety-related complaints and a control group. Measures of comparison were a psychiatric interview, the Middlesex Hospital Questionnaire, the Cornell Medical Index, and an academic achievement checklist. Results indicate an inverse relationship between neurotic anxiety and academic achievement. (English summary)—*P. Vrtunski.*

9614. Fajrajzen, Stefano. [*Differential aspects of human symbiosis in the two sexes.*] (Ital) *Rivista di Psicoanalisi*, 1973(Jan-Apr), No 19, 19-41.—Hypothesizes that in general women are more symbiotic than men, both biologically and psychologically. Biological and cultural factors encourage separation-individuation in the male, making him long for symbiotic union and causing him perennial conflict. The opposite trend appears in the female, who often has a great longing for separation-individuation. These opposite tendencies conflict in heterosexual love. (English summary) (38 ref)—*D. Araoz.*

9615. Feij, J. A. (Vrije U, Lab voor Psychodiagnostische en Bedrijfspsychologische Research, Amsterdam, Netherlands) *An investigation into the meaning of the Achievement Motivation Test: I. Questionnaire correlates.* *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(May), Vol 29(3), 171-190.—Studied the discriminant and construct validity of H. J. M. Hermans's Achievement Motivation Test (AMT), which measures achievement motivation (AM), debilitating anxiety (DA), and facilitating anxiety (FA). The AMT and other personality questionnaires were administered to 50 female and 50 male psychology students. Factor analysis identified 4 secondary factors: Emotional Stability, Introversion, Masculinity, and Lack of Persistence. AM loaded positively on masculinity and negatively on lack of persistence. DA had a negative loading on emotional stability and a positive one on introversion. FA had a negative loading on introversion and therefore did not appear to be an anxiety variable. FA was positively correlated with impulsiveness on the 16 Personality Factor Questionnaire and apparently can be interpreted correctly as a need for activation. Caution is expressed about the interpretation of the scores; the investigator must be aware of the limitations of the correlational techniques. (32 ref)—*A. J. Ter Keurst.*

9616. Florenskaya, T. A. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) [*The sociologizing of Freudianism in the personality theories of K. Horney and H. S. Sullivan.*] (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 161-167.—Presents a critique of the neo-Freudian personality theories of Horney and Sullivan. The defects of both are seen as arising from their dualistic concept of the natural and the social worlds. Neo-Freudianism did not solve the problem that it set itself, which was to overcome Freud's biological determinism and to create a social-psychological theory of personality. The dualistic concept of the natural and the social in Freud makes it impossible, in principle, to solve the basic problems of a psychological theory of personality. (17 ref)—*L. Zuse.*

9617. Fordham, Michael. *Jungian views of the body-mind relationship.* *Spring*, 1974, 166-178.—Discusses Jung's theories of the relation between body and psyche and between psyche and soma. Other related or derivative theories are presented.

9618. Frey-Rohn, Liliane. *From Freud to Jung: A comparative study of the psychology of the unconscious.* (Trans F. E. Engreen & E. K. Engreen). New York, NY: G. P. Putnam's Sons, 1974. xiii, 345 p. \$16.—Presents a study of the basic concepts of Freud

and Jung to show how the foundations laid by Freud were accepted, broadened, and transformed by Jung—how the ideas of psychic mechanisms gave way to the idea of the total personality, how personal elements led to collective aspects of the unconscious, how a causal approach to the psyche became a prospective and finalistic one, and how sexual libido became psychic energy. (8 p ref)

9619. Garza, Raymond T. & Ames, Russell E. (Purdue U) **A comparison of Anglo- and Mexican-American college students on locus of control.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 919.—Data from 47 Anglo and 47 Mexican-American college students matched for sex and socioeconomic background show that Mexican-American Ss scored significantly less external on the full Rotter Internal-External Control Scale and on 2 of the 5 dimensional categories (respect and luck and fate). Findings not only contradict the stereotype that Mexican-Americans are fatalistic but also suggest that their culture contributes to a greater perception of internal control.

9620. Gear, Maria C. & Liendo, Ernesto C. [Toward a unified psychoanalytic theory.] (Span) *Revista de Psicoanálisis*, 1974(Jan-Jun), Vol 31(1-2), 225-276.—Presents a synthesis of theoretical and clinical hypotheses aimed at the unification and systematization of psychoanalytic theories on a new level of abstraction. (English summary) (116 ref)

9621. Gupta, Ved P. (Government Bikram Coll of Commerce, Patiala, India) **The relationship between physical fitness and personality characteristics as measured by Sixteen Personality Factor Inventory.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 94-95.—Anticipated a relationship between physical fitness and personality characteristics on the assumption that the development of personality is affected by physiological factors. The Hindi version of the Sixteen Personality Factor inventory (16 PF) and the Basic Fitness Test Battery were administered in different sessions to 100 20-24 yr old college students. The correlations obtained for all 16 PF scales were nonsignificant.—B. Lindsey.

9622. Helmreich, Robert & Stapp, Joy. (U Texas, Austin) **Short forms of the Texas Social Behavior Inventory (TSBI), an objective measure of self-esteem.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 473-475.—Presents 2 short (16-item) forms of R. Helmreich et al's (1974) Texas Social Behavior Inventory, a validated, objective measure of self-esteem or social competence. Normative data and other statistics are described for 248 males and 282 females. Correlations between each short form and long (32-item) scale were .97. Factor analysis and part-whole correlations verified the similarity of the 2 forms. The utility of the scale in research is described.—Journal abstract.

9623. Hill, A. B. (U Keele, England) **Personality correlates of dream recall.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 766-773.—Used the 16 Personality Factor Questionnaire (16 PF) to discriminate between those who frequently recall dreams and those who do not and to specify which traits contributed most to accuracy of discrimination. Discriminant analysis of 16 PF measures showed an almost

perfect discrimination between 2 groups of undergraduates ( $n = 50$ ), chosen by the diary method, as frequent and infrequent recallers. This result was substantially confirmed in a cross-validation sample of 40 Ss in which an overall accuracy of discrimination of 75% was achieved. 6 primary traits (Ego Strength, Guilt Proneness, Superego Strength, Parmia, Premsia, and Radicalism) were identified and confirmed by canonical analysis as contributing most to discrimination. Results indicate that the frequent recaller experiences less and the infrequent recaller experiences more intrapsychic conflict.—Journal abstract.

9624. Hillman, James. "Anima": II. *Spring*, 1974, 113-146.—Explores extensively the notion of the anima including further perceptions that may aid in alerting the conscious to what we are saying, doing, and even experiencing. In psychology a subjective awareness is required. The theory is offered that a sense of personal identity is given not by the ego, but to the ego by the anima. The main characteristics of "depersonalization" and the integration of the anima are considered. The anima may be personified in the function of relationship to the unconscious and as the mediatrix of the unknown. The anima as uni-personality and the anima in the syzygy are also considered.—A. de La Haba.

9625. Hinrichsen, James J. & Bradley, Laurence A. (Ohio State U, Div of Clinical Psychology) **Situational determinants of personal validation of general personality interpretations.** *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 530-534.—Matched groups of 64 female undergraduates on the basis of their preexperimental opinions on the value of psychological tests used by trained professionals to describe personality. Ss were then given either the Rorschach Test, Thematic Apperception Test, Fundamental Interpersonal Relations—Behavior, or Marlow-Crowne Social Desirability Scale and were later given identical general personality interpretations supposedly based on the test results. An analysis of variance of Ss' ratings of the accuracy of the personality interpretation indicated that neither the type of test S took nor whether the personality interpretation was presented as being derived "for you specifically" or "for people in general" had differential effects on Ss' acceptance of the interpretation; all groups rated the interpretation as being between "good" and "excellent."—Journal abstract.

9626. Hochreich, Dorothy J. (U Connecticut) **Defensive externality and attribution of responsibility.** *Journal of Personality*, 1974(Dec), Vol 42(4), 543-557.—Attempted to use trust as a moderator variable for making differential predictions concerning the behavior of 2 subgroups of externals: defensive externals, whose externality is presumed to reflect primarily a verbal technique of defense, and true externals, whose externality reflects a genuine belief that most outcomes are determined by forces beyond one's personal control. It was predicted that defensive (low trust) externals and true (high trust) externals (as determined by Rotter's Internal-External Control Scale and the Interpersonal Trust Scale) would differ in their attribution ratings of a series of stories which varied in theme (achievement vs nonachievement) and outcome (failure vs success). Specifically, it was hypothesized that defensive externals

would attribute less responsibility to story heroes under failure conditions than would true externals and internals, and that this attribution difference would be strongest when failure occurred in achievement situations. These hypotheses were strongly confirmed for 120 undergraduates in Exp I but not for 120 female Ss in Exp II. In addition, defensive externals were expected to differ from true externals and from internals in their self-descriptive behavior as measured by the Adjective Check List (ACL). The predicted interactions were found for male Ss on 4 of the 7 ACL scales used. (17 ref)—*Journal summary*.

9627. **Huismans, Sipke E.** (Vrije U, Amsterdam, Netherlands) [Reliability and validity of the Scale of Interpersonal Values in relation to educational level.] (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Sep), Vol 29(6), 485-501.—Considers the reliability and validity of L. V. Gordon's 1961 Scale of Interpersonal Values (SIV) in measuring support, conformity, recognition, independence, benevolence, and leadership. 506 adult Ss, about equally divided among lower, middle, and upper levels of education, responded to the scale. The *rs* between the SIV scores and the values toward a job and the government in the areas of benevolence, conformity, and independence ranged from  $-.24$  to  $+.38$ . The low reliability may have been a result of inferior educational attainments, or of cultural differences between Americans and the Dutch. (18 ref)—*A. J. Ter Keurst*.

9628. **Jaffé, Aniela.** *The myth of meaning.* (Trans R. F. Hull). New York, NY: Penguin, 1975. 186 p. \$2.25.—Discusses how Jung's views of the interplay between consciousness and the unconscious led to his theories of the meaning of life. The nature of myth and its relation to meaning, and Jungian concepts of inner experience, individuation, and synchronicity are examined. (7 p ref)

9629. **Khatena, Joe.** (Marshall U) *Imagination and production of original verbal images.* *Art Psychotherapy*, 1973(Fal), Vol 1(2), 113-120.—Discusses measurement of creative imagination by the Onomatopoeia and Images test. Words of suggestive sound and meaning (e.g., moan, ooze, growl) are responded to with verbalized images. Ss are encouraged to find unusual responses, which are given higher scores than popular ones. Repeated use of the same stimulus words creates stress, which enhances imagination. When the time interval between words is fixed at 15 sec, adults need a longer warm-up period than children; highly creative adolescents perform best without time limit. Children's imagination slumps in the upper grades of elementary school. The stimulus words also are used for synectic analogy tests. (58 ref)—*R. Arnheim*.

9630. **Lefcourt, Herbert M.; Antrobus, Paul & Hogg, Elizabeth.** (U Waterloo, Ontario, Canada) *Humor response and humor production as a function of locus of control, field dependence and type of reinforcements.* *Journal of Personality*, 1974(Dec), Vol 42(4), 632-651.—Administered Rotter's Internal-External Control Scale and the rod-and-frame test to 64 male senior high school and university students. Ss' humor response and humor production were scored from videotapes of role-play enactments. Roles varied for reinforcement areas (academic-social), for outcomes (success-failure), and for E's

comments (serious-ludicrous). It was hypothesized that persons with an internal locus of control would be more likely than externals to use humor as a distancing device that would enable them to accept evaluative feedback. Humor responses, smiles, and laughter proved to be more determined by role characteristics than by personality variables. However, humor production—the creating of jokes—seemed to be most common among internal, field-independent Ss enacting serious failure roles, as had been predicted. (21 ref)—*Journal summary*.

9631. **Lefley, Harriet P.** (U Miami, Medical School) *Differential self-concept in American Indian children as a function of language and examiner.* *Journal of Personality & Social Psychology*, 1975(Jan), Vol 31(1), 36-41.—Investigated the hypothesis that minority self-concept may vary as a function of implicit ethnic and nonethnic evaluative criteria by testing 40 7-15 yr old Mikasuki Seminole Indian children in their native language (Mikasuki) with Indian examiners and in English with Anglo examiners. 2 reservation groups, matched for age and sex, received 4 administrations of the Piers-Harris Children's Self-Concept Scale and an Indian self-concept scale, in a repeated measures counterbalanced design, varying language and order. Significant test-retest correlations indicated response stability across languages and time. Results, homogeneous for all subgroups, show significantly higher personal self-concept in Mikasuki and significantly higher Indian self-concept in English. It is suggested that minority testing may involve culturally patterned and context-bound response tendencies.—*Journal abstract*.

9632. **LeVine, Robert A.** (U Chicago) *Patterns of personality in Africa.* *Ethos*, 1973(Sum), Vol 1(2), 123-152.—Discusses the nature of distinctively African personality patterns, variations and uniformities in African behavior, and the relationship between African personality traits and adaptation to institutional change. Sub-Saharan African populations are characterized by strict age and sex based social hierarchies, an emphasis on material transactions, functional diffusion of authority, absence of separation anxiety, and a tendency toward concreteness of thought. It is suggested that the emphasis on social distance, formality, and material obligations in African relationships facilitates personal adjustment to social change by allowing maintenance of traditional kinship organization despite increased geographical mobility. (18 ref)—*J. Kelly*.

9633. **Loesch, Larry C. & Johnson, Richard H.** (U Florida) *The NNPI: In sickness or in health.* *Personnel & Guidance Journal*, 1974(Apr), Vol 52(8), 541-545.—Presents a parody of a typical personality inventory research found in professional journals, using the mythical Nonsense Personality Inventory (NNPI) and its specifications. The intent of the parody is to support criticism of the psychological testing movement.

9634. **Ludvig, Elek J. & Happ, Deborah.** (Michigan State U) *Extraversion and preferred level of sensory stimulation.* *British Journal of Psychology*, 1974(Aug), Vol 65(3), 359-365.—Conducted a study with 120 male undergraduates to test the hypothesis that a positive correlation exists between extraversion scores (as determined by scores on the Eysenck Personality Inventory) and the amount of ambient illumination and sound

necessary to provide optimum hedonic tone and to create a slightly unpleasant level of hedonic tone. Results support the existence of a positive correlation between extraversion and sensory-seeking behavior hypothesized by H. Eysenck (1967), but suggest that the relationship between the variables is due to differences between introverts and extraverts as to what constitutes an excessive level of stimulation. (19 ref)—*Journal abstract*.

9635. Many, Wesley; Ellis, Joseph & Frey, Sherman. (Northern Illinois U) **A self-concept scale for middle childhood.** *Journal of the Association for the Study of Perception*, 1974(Fal), Vol 9(2), 14-35.—Following the theory of R. J. Havighurst (1972), it is assumed that an individual must accomplish certain tasks during each of the 6 stages of his development in order to form and maintain a positive self-image. An inventory scale designed to enable the 6-12 yr old child to give reports of his self-concept is presented. The child indicates his conception of his ability to accomplish each of the 9 developmental tasks specified by Havighurst as being proper to his age period. He is asked to give these indications in terms of what he is capable of doing, what he does in relation to others, and how what he does compares to what he must do in order to succeed at the task. The word difficulty of the inventory scale has been adjusted to the age period by means of the application of a readability formula.—*B. Lindsey*.

9636. Marwit, Samuel J.; Bostwick, Gerald & Well, Marsha B. (U Missouri, St Louis) **Effects of task orientation on sexual bias in TAT administration.** *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 547-550.—64 male and 64 female undergraduates chose Thematic Apperception Test cards expecting to test same- and cross-sexed clients under achievement-oriented and control conditions. The hypotheses that females would select more task-oriented cards than males, regardless of client sex, and that males would select more sexually oriented cards, especially when testing female clients, were not supported. Both males and females selected more achievement-related cards under achievement-oriented conditions, and no differences occurred in either experimental or control conditions in their selection of sexual-romantic cards.—*Journal abstract*.

9637. Mohan, Vidhu. (Panjab U, Chandigarh, India) **Raven's Standard Progressive Matrices and a verbal test of general mental ability.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 67-69.—Anticipated a positive relationship between scores on the nonverbal Standard Progressive Matrices test (SPM) and scores on the verbal General Mental Ability test (GMA) on the assumption that both tests measure a general factor of intelligence. The tests were administered to 145 male and 165 female 18-25 yr old students. Results show significant positive correlations between SPM and GMA for both the male and the female Ss ( $P < .001$ ). The hypothesis is considered to be confirmed, and sex differences on both SPM and GMA favoring the male Ss are discussed.—*B. Lindsey*.

9638. Ohlson, E. Lamonte & Wilson, Marilyn. (Ohio State U) **Differentiating female homosexuals from female heterosexuals by use of the MMPI.** *Journal of Sex Research*, 1974(Nov), Vol 10(4), 308-315.—Administered the MMPI to 64 overt female homosexuals and 64

overt female heterosexuals. The 2 groups were significantly differentiated on 3 of the 13 scales (*Hs*, *Hy*, and *Pr*) and on 57 of the items. Results indicate that a personality scale could be developed using items from the MMPI to detect female homosexuality. (21 ref)

9639. Ojha, Hardeo. (Bhagalpur U, India) **The relation of prestige suggestion to rigidity and dependence proneness.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 70-73.—Explored the possibility of relationships between prestige suggestion (PS) and the personality factors of rigidity (R) and dependence proneness (DP). 120 male students (mean age = 19.1 yrs) and 120 female students (mean age = 18.2 yrs) were given a Hindi version of Wesley's Short Form Rigidity Scale and Sinha's Dependence Proneness Scale. A measure of prestige suggestion was obtained from differences in the ranking of slogans before and after their attribution to various political leaders. Significant positive correlations between PS and DP were obtained for both the male ( $p < .01$ ) and female Ss ( $p < .05$ ), and a significant negative correlation between PS and R was obtained for the male Ss ( $p < .05$ ). A further analysis based on a division of scores into high and low groups is presented. (19 ref)—*B. Lindsey*.

9640. Phares, E. Jerry & Lamiell, James T. (Kansas State U) **Relationship of internal-external control of defensive preferences.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 872-878.—Described 4 tests (Rotter Level of Aspiration Board, a symbol substitution test, a geometric recall test, and the Stromberg Dexterity Test), ostensibly designed to measure IQ, to 67 undergraduates classified as either internal or external on Rotter's Internal-External Control Scale. For 2 tests, E's descriptions of the tests included built-in rationalizations to provide Ss with potential explanations for any test failures. The other 2 tests were described without such rationalizations. As predicted, externals demonstrated a significantly greater preference for the so-called rationalized tests than did internals. Differences were also observed between internals and externals in expectancy for success. Potential relationships among locus of control, defensive preferences, and expectancies for success are discussed. (24 ref)—*Journal abstract*.

9641. Prasad Singh, Kedar. (Bhagalpur U, India) **Anxiety and birth order.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 64-66.—Considered whether a relationship between anxiety and birth order could be obtained in Indian culture. 72 firstborn, 63 middle-born, and 65 last-born 21-24 yr old male students were given a Hindi version of the Sinha Anxiety Scale. The mean anxiety score of the firstborn was significantly higher than that of the middle-born ( $p < .01$ ) and that of the last-born ( $p < .05$ ) Ss. Environmental factors pertaining to the greater anxiety shown by the firstborn are discussed. (16 ref)—*B. Lindsey*.

9642. Ramamurti, P. V. & Gnanakannan, I. (Sri Venkateswara U, Tirupati, India) **Rigidity-flexibility characteristics of secure and insecure individuals.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 54-55.—Hypothesized a positive relationship between rigidity and feelings of insecurity. 300 students (mean age = 18.4 yrs) were scored for Rigidity-Flexibility by using the Test of Behavioural Rigidity and for

Security-Insecurity by using the Security-Insecurity Inventory (SI). The mean Personality-Perceptual Rigidity score of the bottom quartile (insecure group) of the distribution of SI scores was significantly lower ( $p < .01$ ) than the mean of the top quartile (secure group); the higher scores were in the direction of flexibility. The mean Motor-Cognitive Rigidity scores of the 2 groups were not significantly different. The positive finding indicates that the rigidity of insecure individuals is greater than that of secure individuals.—B. Lindsey.

9643. Reinking, Richard; Goldstein, Gerald & Houston, B. Kent. (Washington State U) **Cognitive style, proprioceptive skills, task set, stress, and the Rod-and-Frame Test of field orientation.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 807-811.—Data from 181 female undergraduates indicate that (a) performance on the rod-and-frame test (RFT) in a condition in which Ss took the test in a tilted position was more adversely affected for field-dependent than field-independent Ss; (b) inducing a set in Ss to focus on internal cues while performing the RFT led to better performance than inducing a set to focus on external cues; and (c) under stress, performance on the RFT for field-dependent Ss appeared more extremely field dependent than in the absence of stress, and under stress, performance on the RFT for field-independent Ss appeared more extremely field independent than in the absence of stress.—*Journal abstract*.

9644. Riester, Robert W. & Irvine, LaVerne F. (Auburn U) **A methodological inquiry into the F scale.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 287-288.—Results of a study examining the nature of free responses to R. Lee and P. Warr's Balanced F Scale items seem contradictory to expectations that authoritarians are rigid and stereotyped in thinking while nonauthoritarians are open and flexible. Questions are raised about the authoritarian personality as measured by this F scale.

9645. Schoenfeld, C. G. (Private practice, New York, NY) **International law, nationalism, and the sense of self: A psychoanalytic inquiry.** *Journal of Psychiatry & Law*, 1974(Fal), Vol 2(3), 303-318.—Analyzes 2 basic elements of nationalism—the tendency to view one's nation as an enlargement of one's self, and the tendency to distinguish sharply between the members of one's nation and other persons. It is suggested that nationalism may help many individuals (at least on an unconscious level) to bolster a less-than-secure sense of self and that to the extent that nationalism plays this role, it is likely to continue to inhibit the growth and development of international law. (37 ref)—*Journal abstract*.

9646. Shedletsky, Ralph & Endler, Norman S. (Queen St Mental Health Ctr, Toronto, Ontario, Canada) **Anxiety: The state-trait model and the interaction model.** *Journal of Personality*, 1974(Dec), Vol 42(4), 511-527.—Examines the state-trait anxiety theory proposed by C. D. Spielberger (1966, 1972) as a conceptual frame of reference for integrating differing viewpoints of anxiety. Because of limitations in the state-trait theory, N. S. Endler and J. M. Hunt's (1966, 1968, 1969) Person  $\times$  Situation interaction model of anxiety is examined, and an attempt is made to integrate the 2 approaches. Specifically, the interaction model of anxiety

supports the belief that trait anxiety is multidimensional rather than unidimensional and that one must take into account the specific nature of the threat situation confronting the individual. It is proposed that the construct of trait anxiety appears to be more complex than originally formulated by Spielberger and that a comprehensive approach to the investigation of anxiety-trait, anxiety-state, and their relationship may be found in the Person  $\times$  Situation interaction model of anxiety. (50 ref)—*Journal summary*.

9647. Simon, William E.; Primavera, Louis H.; Simon, Marilyn G. & Orndoff, Robert K. (Southampton Coll) **A comparison of marijuana users and nonusers on a number of personality variables.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 917-918.—Compared 27 female undergraduate marijuana users and 147 nonusers on psychological needs, self-descriptions, self-esteem, academic achievement, birth position, and attitudes toward the legalization of various items. Among others, significant differences between the users and nonusers were found on high school averages, 6 scales of the Edwards Personal Preference Schedule, and on 5 bipolar adjective scales assessing carefulness, honesty, politeness, reliability, and ambition.

9648. Smithers, A. G. & Child, D. (U Bradford, School of Research in Education, England) **Convergers and divergers: Different forms of neuroticism?** *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 304-306.—Results of a study of 306 undergraduates support L. Hudson's (1966) contention that convergence-divergence is linked to arts and science specialism, and that convergers and divergers differ in subject interest, occupational interests and attainment, and degree of syllabus-boundness.

9649. Soifer, Raquel. [Incorporation of the analysis of external reality and its relation to the internal world: A personal experience.] (Span) *Revista de Psicoanálisis*, 1974(Jan-Jun), Vol 31(1-2), 439-458.—Presents an analysis and extension of Freud's insights into the interaction of the internal and external world. A method of studying the development of the narcissistic libido is suggested. (English summary) (24 ref)

9650. Swan, Jim. **Mater and Nannie: Freud's two mothers and the discovery of the Oedipus complex.** *American Imago*, 1974(Spring), Vol 31(1), 1-64.—Discusses some personal, cultural, and historical factors contributing to Freud's discovery of the Oedipus complex. The contradictions of late 19th century European bourgeois society are reflected in Freud's theoretical concerns with unresolved conflicts over masculine and feminine identification. An analysis of dreams reported by Freud in correspondence with M. Fliess reveals his personal preoccupation with mother dependence, incestuous sexual wishes, and oral aggression. It is suggested that the discovery of the Oedipus complex grew from an attempt by Freud to solve his own neurosis, which resulted from the childrearing conditions in 19th century Vienna.—J. Kelly.

9651. Tellenbach, Hubert. **On the nature of jealousy.** *Journal of Phenomenological Psychology*, 1974(Spring), Vol 4(2), 461-468.—Defines jealousy as the anticipatory fear of the loss of a loved object which is felt to be necessary to self-fulfillment. It is suggested that jealousy becomes

pathological when the individual's attitude changes from fear of possible loss to an obsessive certainty that the loved object will be lost.

9652. Tribich, David & Messer, Stanley. (Rutgers State U, New Brunswick) **Psychoanalytic character type and status of authority as determiners of suggestibility.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 842-848.—Predicted that oral character types selected by the Blacky Pictures would report a similar amount of movement of a light as an authority figure when viewing the autokinetic phenomenon in his presence, while anal character types would remain independent of his influence or would even respond oppositionally. Data from 107 male undergraduates support the hypothesis: orals were much more suggestible in the presence of either a high-status authority figure or a peer than were anals or members of a neutral control group. While professing to be unaware of any influence, orals moved away from their baseline responses in the direction of the authority figure, while anals moved away from their baseline in opposition to the authority figure.—*Journal abstract*.

9653. Verma, S. K. (Postgraduate Inst of Medical Education & Research, Chandigarh, India) **The difficulty levels of some personality tests in Hindi.** *Indian Journal of Clinical Psychology*, 1974(Mar), Vol 1(1), 15-18.—Examines the difficulty level of 17 personality and adjustment inventories in Hindi. The 2 criteria for difficulty level are average sentence length and percentage of "hard" words. Results indicate that only 4 tests were acceptable in terms of both criteria. Although the average sentence length of most tests was satisfactory, the percentage of "hard" words was excessive. Thus, difficulty level must be a prime consideration in test construction and adaptation. Test results are meaningless if the difficulty level of the language is beyond the level of comprehension of the majority of the population.—*F. S. Beyer*.

9654. Veszy-Wagner, Lilla. [Destructiveness against individuals and groups.] (Germ) *Dynamische Psychiatrie*, 1973, Vol 6(6), 414-426.—Suggests that neither the development of the child nor the development of mankind provide any evidence for the existence of an innate primary instinct of destruction, not even in the circumstances of manifest aggression. A theory of a secondary destructive instinct is developed and explained on the basis of examples of mass behavior, differing family constellations, historic and anthropological studies. The principal difference between aggression and destruction is that aggression is goal-oriented. (English summary)—*T. Fisher*.

9655. Wallace, Edith. **Conventional boundaries or protective temenos.** *Art Psychotherapy*, 1973(Fal), Vol 1(2), 91-99.—Employs Jungian concepts to distinguish between the boundaries built by the anxious ego as a protection of conventional safeguards and the sacred precinct, the "temenos," within which the search for the unconscious center of the self can be carried out. Examples from the dreams of patients and the novels of J. Conrad illustrate the struggle for transcendence. Creativity requires this liberation from limiting convention and serves as an instrument for achieving it. The

organic order of the self replaces the order superimposed by the ego.—*R. Arnheim*.

9656. Wessman, Alden E. et al. (City Coll, City U New York) **Personality and linear representation of temporal location.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 914-90 undergraduates completed 3 personality tests and a task in which Ss located 1 wk, 7 mo, 3 yrs, and 9 yrs past and future on 2 time lines labeled "birth to now" and "now to death." Data fit commonsense expectations that self-control, responsibility, and cognitive caution go along with subjective locations of the past and future close to the present and suggest that performance on a simple time line reflects some intimate relationships between temporal experience and personality.

9657. Wiesenbütter, Eckart. [Compulsive gambling.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1974(Jan), Vol 22(2), 147-160.—Contends that compulsive gambling and not problem drinking is the original addiction. The use and the psychological meaning of hands is discussed. Animal games underlie and are supported by the mother's hand contact with the child. The child plays with his hands and play grows into work activity. Play is immaturity, work is maturity. Addictive states and compulsive mechanisms—kleptomania, heavy smoking, alcoholism, etc.—are seen as a breakdown in the maturing process where development stops at the level of handplay, short of handwork, and displays tangential behavior.—*S. D. Babcock*.

9658. Witkin, Herman A. et al. (Educational Testing Service, Princeton, NJ) **Social conformity and psychological differentiation.** *International Journal of Psychology*, 1974, Vol 9(1), 11-29.—200 male and female Ss of 2 age groups (approximately 10 and 13 yrs) from each of 3 countries—Holland, Italy, and Mexico—and from 1 village in each country that was noted for social conformity and 1 village that was not, took field dependence tests, including the rod-and-frame test, the Children's Embedded Figures Test or the regular Embedded Figures Test, and the block design subtest of the WISC or the WAIS. Each S also made drawings of a male and female, to which the articulation-of-body-concept scale was applied, and took the Vocabulary subtest of the WISC. Analysis of variance of results on all differentiation measures gave strong and significant support to the hypothesis that Ss from villages low in social conformity would perform in a more field-independent fashion than Ss from villages of high social conformity. The hypothesis that older children would differ more than younger children also received significant support. Consistent sex differences did not appear, though significantly higher vocabulary scores occurred for children from villages marked by lesser social conformity. (56 ref)—*E. A. Gavin*.

9659. Wucherer-Huldenfeld, Augustinus. [Freud's genealogy of morality.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1974(Jan), Vol 22(2), 132-146.—Notes that Freud believed infantile helplessness to be a prerequisite to any kind of morality. Unpleasant events were viewed as educators. It is possible to apply his theories to F. Nietzsche's *The Genealogy of Morality*.

## PROFESSIONAL PERSONNEL

9660. Anthony, William A.; Gormally, James & Miller, Henry. (Boston U) **Prediction of human relations training outcome by traditional and nontraditional selection indices.** *Counselor Education & Supervision*, 1974(Dec), Vol 14(2), 105-111.—Used a variety of traditional and nontraditional selection indices to predict the outcome of a graduate-level course in counseling designed to improve human relations skills. Ss were 21 graduate counseling students. Multiple correlations of .75-.80 were found between a measure of training outcome and various combinations of predictors. A series of multiple linear regression analyses indicated that the traditional selection indices—grade point average, Graduate Record Examination scores (both Verbal and Quantitative scales), and the Miller Analogies Test—accounted for a very minor amount of the variance in ratings of the final taped interview. In contrast, a newly developed selection measure (trainability index) accounted for almost all of the predictable variance. The need for a new and more efficient predictive model for graduate-level counselor training is discussed.—*Journal abstract.*

9661. Arieti, Silvano. (New York Medical Coll, NY) **Psychiatric controversy: Man's ethical dimension.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 39-42.—Considers that although determinism may permeate human existence, man's moral values raise him above the level of an animal and enable him to direct his own life. It is suggested that psychiatrists should influence the patient to exert his will, make conscious choices, and, above all, assume a sense of responsibility for his own actions. In order to free the patient from whatever conditions hinder his will and to help him make choices, psychiatric treatment must consider man's ethical dimension.—*Journal abstract.*

9662. Armstrong, Renate G. (VA Hosp, Northport, NY) **A comparison between group therapists and members of the desired degree of self-disclosure by therapists.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 20-21.—The Group Therapist Orientation Scale (GTOS), which measures extent and type of self-disclosure was self-administered by several group therapists, and then given to 2 outpatient groups who indicated what self-disclosing behavior they desired from their therapists. Different results from therapists and patients are interpreted to mean that therapists may be "ahead" of the needs of group members. Therapists who believe in participating self-disclosure may not practice it effectively, and the group thus responds to older behavior patterns observed in therapists rather than to newer covert ideal patterns.

9663. Autor, Sherry B. & Zide, Ellen D. (Massachusetts General Hosp, Boston) **Master's-level professional training in clinical psychology and community mental health.** *Professional Psychology*, 1974(May), Vol 5(2), 115-121.—Describes a 2-yr master's level training program which has the development of clinical competence for community practice as its primary goal. Training takes place in a community mental health facility under the guidance of a clinician who practices there. A broad range of diagnostic techniques, therapeutic

modalities, and preventive interventions are taught in seminars and in supervision by introducing theoretical material when it can best clarify the clinical process in which the trainee is engaged. There is a progressive increase in field experience throughout the training period in which the trainee works with people who present a variety of psychological and social problems and thus learns which techniques are most realistic and relevant.—*B. Lindsey.*

9664. Ballis, George U.; Weintraub, Walter & Mackie, James. (U Maryland, Medical School, Baltimore) **A four-year behavioral science-psychiatry track in undergraduate medical education.** *Journal of Medical Education*, 1974(Nov), Vol 49(11), 1051-1056.—Describes a program in which students complete specialty offerings in addition to the requirements of a standard 4-yr medical curriculum. The program provides, from the 1st mo of the freshman year, a progression of combined didactic and clinical experiences in the behavioral sciences and in clinical psychiatry. Students completing the program are expected to have acquired a foundation of knowledge and skills that is envisioned as equivalent to that provided by 1 yr of traditional residency training in psychiatry.—*Journal abstract.*

9665. Barnat, Michael R. (Livingston Community Mental Health Ctr, Howell, MI) **Some characteristics of supervisory identification in psychotherapy.** *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 189-192.—Gives examples of the spontaneous stylistic characteristics of supervisors and how these increase the competence and professional identity of trainee therapists.

9666. Bazelon, David L. (US Court of Appeals for the District of Columbia Circuit, Washington) **The perils of wizardry.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1317-1322.—Considers that as biobehavioral scientists, psychiatrists bear a major responsibility in the current revolution involving the understanding of the brain and human behavior. Based on the author's experience in the courtroom, psychiatry's primary focus on treatment and its penchant for diagnostic labeling is viewed as dangerous; the field may lose sight of the social determinants of behavior. Psychiatrists are urged to acknowledge and respond to the ethical challenges posed by their great power, their "wizardry" in the use of behavior modification, psychosurgery, and chemotherapy.—*Journal abstract.*

9667. Bentkover, Stuart H. et al. (Mt Sinai School of Medicine, City U New York) **Student perspectives on learning in a prepaid group practice: A manpower training program in an HMO.** *Health Services Research*, 1974(May), Vol 89(3), 225-229.—Describes the opportunities for medical education in a prepaid group practice setting.

9668. Bernstein, Arnold. (Queens Coll, City U New York) **The genital psychoanalyst.** *Psychoanalytic Review*, 1974(Sum), Vol 61(2), 257-267.—Describes the genital analyst as one free from sexual disturbance and not obsessed by infantile moral imperatives. An analogy is drawn between the genital mother who accepts sensual pleasure connected with meeting her child's needs and the analyst responding to the sensual countertransference reactions within analysis. The mature analyst can

enjoy genital feelings, talk about them, know the difference between word and deed, and so show the way for the patient's growth.—*B. Smith.*

9669. **Berry, Patricia.** *An approach to the dream.* *Spring*, 1974, 58-79.—Discusses means in dream analysis for interpretive self-awareness, a method enabling the analyst to examine his actual interpretation process or to interpret his own interpretations. Some of the components of the dream image (sensuality, texture, emotion, simultaneity, intrarelations, value, and structure) are examined, as are the implications of the image. The narrative or dramatic structure of dreams is considered together with a third category, supposition, under which causality, evaluation, generalization, and specification operate. Analysts are urged to learn the psychology of the image proceeding from a recognition of unsuitable interpretive moves vis-a-vis dreams.—*A. de la Haba.*

9670. **Brokowski, Anthony & Schulberg, Herbert C.** (United Community Planning Corp, Boston, MA) *A model training program for clinical research and development.* *Professional Psychology*, 1974(May), Vol 5(2), 133-139.—Outlines a graduate-level program designed to enable students to function as specialists in clinical research and development through the acquisition of the capacity both to understand basic research and to develop practical applications. Breadth rather than depth of knowledge is stressed. The curriculum includes courses in the relevant basic sciences, and all courses in psychology are oriented toward the application of research findings to solve personal and social problems. There is formal training in research technology, with exposure to concepts such as utility theory and systems analysis. The research training focuses upon the acquisition of program evaluation skills and emphasizes the future role of the student as a change agent.—*B. Lindsey.*

9671. **Chartoff, Marvin B. & Bardon, Jack I.** *The relationship between position title and where one receives his doctorate in school psychology.* *Professional Psychology*, 1974(May), Vol 5(2), 175-177.—Obtained evidence from a questionnaire survey of all known graduates ( $N = 328$ , or 78% of those surveyed) of doctoral programs in school psychology in the US indicating the existence of a relationship between the graduate school attended and the type of subsequent professional functioning. The 7 largest doctoral programs were compared. Among the programs the percentage of graduates varied from 16.8 to 64.3 working in school positions, varied from .0 to 30.0 working in clinical positions, varied from 15.0 to 66.6 working in college teaching or administrative positions, and varied from .0 to 14.3 working in research positions. It is concluded that each program somehow tends to shape its students in certain directions.—*B. Lindsey.*

9672. **Cormier, L. Sheryllyn; Hackney, Harold & Segrist, Allen.** (West Virginia U) *Three counselor training models: A comparative study.* *Counselor Education & Supervision*, 1974(Dec), Vol 14(2), 95-104.—Investigated the effects of 3 prepracticum counselor training approaches on counselor performance: T group, behavioral skills, and discussion control. Pre- and postmeasures consisting of 30-min video-recorded counseling interviews were administered to 18 student counselors.

Counselor performance was evaluated by client completion of the Counseling Evaluation Inventory (CEI) and by 3 trained judges' ratings of 4 5-min interview segments using the Counseling Strategies Checklist (CSC). Data from each instrument were subjected to a  $3 \times 2$  factorial analysis of variance. A significant Group  $\times$  Time interaction occurred for the CEI. Significant time effects occurred on 4 of the 7 dependent variables of the CSC. Results have implications for both the length and type of training approach used in effective counselor education practices. (18 ref)—*Journal abstract.*

9673. **Counte, Michael A. & Kimberly, John R.** (Indiana U, Ft Wayne) *Organizational innovation in a professionally dominated system: Responses of physicians to a new program in medical education.* *Journal of Health & Social Behavior*, 1974(Sep), Vol 15(3), 188-198.—Discusses the importance of understanding factors which influence variability in the responses of professionals to organizational innovation efforts. Results of a study which explored this issue in the context of the health care system are reported. Variability in the responses of 332 practicing physicians to an organizational innovation (a new medical education program) was examined in light of a number of hypotheses derived from the literature on the adoption of innovation. Findings support 5 of the 6 hypotheses tested, and suggest that receptivity to organizational innovation in professionally dominated systems is influenced by factors similar to those in other systems (e.g., local or cosmopolitan orientation, age, and amount of influence attributed to the change agent). 9674. **Dickerson, Larry R. & Roberts, Ralph R.** (Arkansas Rehabilitation Research & Training Ctr, Ctr for Continuing Education in Rehabilitation) *The effectiveness of prepackaged instructions for the inservice training of rehabilitation counselors.* *Counselor Education & Supervision*, 1974(Dec), Vol 14(2), 133-139.—Evaluation of 30 learning units (tape recordings and supplementary readings) indicates that a voluntary packaged instructional approach to the conceptual training of rehabilitation counselors is promising, but that greater effort is needed in developing the actual content of the training materials and insuring the motivation of the package users.

9675. **Engs, Ruth C. & Kirk, Robert H.** (Indiana U) *The characteristics of volunteers in crisis intervention centers.* *Public Health Reports*, 1974(Sep-Oct), Vol 89(5), 459-464.—Presents demographic characteristics and California Psychological Inventory scores of 74 volunteers in 5 crisis intervention centers.

9676. **Gentry, W. Doyle.** (Duke U, Medical Ctr) *Three models of training and utilization.* *Professional Psychology*, 1974(May), Vol 5(2), 207-214.—Describes the employment of psychological technicians in 3 somewhat different clinical settings, focusing on the details of technician selection, training, and duties. A specification of the degree and type of service demand and the number and type of psychological staff are given for each clinical setting. The selection criteria in all settings include a bachelor's degree and an ability to relate easily on an interpersonal level. An apprenticeship model is used for training in all settings, with a stress on close

supervision and working relationships. The technician is employed in each setting primarily to administer and score psychometric tests and report on relevant patient behaviors. Some differences in technician employment in the 3 settings are noted, and the lack of male technicians is queried. (21 ref)—*B. Lindsey.*

9677. Gentry, W. Doyle. (Duke U, Medical Ctr) **Technicians' views of training and function.** *Professional Psychology*, 1974(May), Vol 5(2), 219-221.—Summarized the responses to an open-ended questionnaire, sent to all current and past psychological technicians of 3 medical centers, that requested a self-evaluation of training and functioning. The types of comments, mostly positive, made by the respondents regarding their respective training programs, their functioning in the role of technician, and their work relationships are presented. Changes in attitude or behavior ascribed by the respondents to training and work as a technician are classified according to changes within the self, changes in attitudes toward sick and disturbed individuals, and changes in life goals or career plans. Suggestions about ways in which the technician's role should be extended included training in interview techniques and interpretation of assessment protocols.—*B. Lindsey.*

9678. Gerber, Lane A. (Medical Coll Ohio, Toledo) **An approach to teaching the psychotherapy systems and techniques seminar.** *Professional Psychology*, 1974(May), Vol 5(2), 231-233.—Presents a method for arousing and sustaining intellectual curiosity and emotional-personal involvement employed in a seminar on psychotherapy systems and techniques. Each participant was asked to choose a therapist, present his life data and his theory, demonstrate his technique, and answer questions as if he were that therapist. Several apparent advantages of the method are discussed.—*B. Lindsey.*

9679. Geyman, John P. & Guyton, Rick. (U California, Medical School, Davis) **Evaluation of multimedia self teaching programs for medical students taking community preceptorships.** *Journal of Medical Education*, 1974(Nov), Vol 49(11), 1062-1063.—Describes an evaluation of 12 programs comprising 6 types of media—audiocassette, and audiocassette-slides, 16 mm film, 16 mm film-monograph, slides-handout, and printed information—used to supplement the learning of senior medical students taking elective family practice preceptorships.

9680. Gibson, Beryl S. & Reed, John C. (Texas Women's U, Pediatric Nurse Practitioner Program) **Training nurses in MR.** *Mental Retardation*, 1974(Dec), Vol 12(6), 19-22.—Compared the behavior, knowledge, and attitudes of a total of 667 student nurses, faculty, and staff to determine reactions to a nursing program which incorporated theory and supervised clinical practice in mental retardation. Ss showed a positive shift in attitudes toward the mentally retarded.

9681. Gilmartin, Kevin M. & MacKinnon, William J. (Norfolk Regional Ctr, NB) **The effects of staff retraining and SPAN decision making on group problem solving.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 9-11.—17 Behavioral Sciences, 1974(May), Vol 16(2), 9-11.—17 groups of staff members (7-13 members each) utilized either the Social Participatory Allocative Network (SPAN) method of group decision making or the

conventional group discussion format. SPAN surpassed conventional methods in producing group problem solving superior to the best individual solutions.

9682. Goldman, Lee. (U California, San Francisco) **Factors related to physicians' medical and political attitudes: A documentation of intraprofessional variations.** *Journal of Health & Social Behavior*, 1974(Sep), Vol 15(3), 177-187.—Surveyed attitudes of medical students and graduates toward possible changes in the organization and delivery of medical care in the US. The best predictors of a respondent's score on the attitude scale were his political ideology, the organization of his medical practice, and whether he was still in medical school. Data document the heterogeneity of American doctors. (27 ref)

9683. Grossman, Herbert J. & Rowitz, Louis. (Illinois State Pediatric Inst, Chicago) **Program accountability in mental retardation.** *Mental Retardation*, 1974(Dec), Vol 12(6), 8-11.—Reviews from a historical perspective developments in accountability on clinical and research activities of mental retardation programs. The relationship between program accountability and evaluation is also discussed.

9684. Haase, Richard F. (U Massachusetts, Student Development Ctr, Amherst) **Power analysis of research in counselor education.** *Counselor Education & Supervision*, 1974(Dec), Vol 14(2), 124-132.—Discusses statistical power analysis as a necessary and desirable activity in counselor education research. Power of counseling research is discussed with respect to alpha levels, sample size, and size of effect. 4 yrs of counselor education research are reviewed and analyzed according to the criteria of statistical power. Recommendations for increasing the power of research in counselor education are made.—*Journal abstract.*

9685. Hance, Gloria E.; Riach, Margaret J. & Fenster, Charles B. (VA Hosp, Clinical Training Program, Phoenix, AZ) **Evaluating students' clinical skills.** *Psychological Record*, 1974(Fal), Vol 24(4), 481-489.—12 undergraduates conducted informational interviews with applicants to the Psychology Learning Center, a college level educational program. (a) to determine the reliability of a newly developed rating instrument and (b) to evaluate the effects of the center on Ss' acquisition of practical clinical skills. The Ss' performances as interviewers were rated by 3 expert clinicians using the new rating instrument. The raters achieved unusually high agreement on the definition of clinical skills due to a combination of (a) behavioral definitions of characteristics useful in interviews with (b) previously developed clinical judgments. Learning center Ss consistently were rated more skillful in conducting these interviews than matched controls and were rated higher on awareness of their mistakes and abilities. (17 ref)—*Journal abstract.*

9686. Hanson, Philip G. & Peck, Cecil P. (VA Hosp, Houston, TX) **Training for individual and group effectiveness and resourcefulness (TIGER).** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 1-3.—Reorganization of the admissions units of Veterans Administration hospitals includes a new systematic training program for personnel who have initial contacts with applicants for medical care. The TIGER program, designed to help personnel

develop interpersonal communicative skills, is described in detail.

9687. Hauss, K.; Neidenbach, N.; Stegemann, H. & Völkel, H. [Planning and realization of a course in medical psychology.] (Germ) *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1974(Jan), Vol 24(1), 13-21.—Describes the content and method of a course in medical psychology which is compulsory in the preclinical curriculum under the new Certification Regulation for Physicians. The course was developed during the summer of 1972 and was offered in the fall semester 1972 to 120 1st-term medical students at the Keil University Mental Hospital. The difficulties in choosing course content and goals are described, and the problems of implementing the program are discussed, with its advantages and disadvantages. Conclusions and experiences will be taken into consideration for further planning of the course.—S. D. Babcock.

9688. Jones, Lawrence K. (North Carolina State U, Raleigh) **The Counselor Evaluation Rating Scale: A valid criterion of counselor effectiveness?** *Counselor Education & Supervision*, 1974(Dec), Vol 14(2), 112-116.—Studied whether the Counselor Evaluation Rating Scale (CERS) should be used as a criterion measure of counselor effectiveness in studies attempting to identify correlates of counselor effectiveness. The validity of recent recommendations regarding the use of certain factors of the 16 Personality Factor Questionnaire to select persons for counselor training programs, where the CERS was the criterion measure, is challenged. Relationships between the 3 scales of the CERS and levels of empathy, respect, and empathy offered in a counseling relationship were investigated with 19 graduate students. Only 1 of the hypothesized relationships was found ( $p < .05$ ). (16 ref)—*Journal abstract*.

9689. Jones, Richard D. & Neil, Thomas C. (San Diego State U, Drug Rehabilitation Project) **A study on maintaining workshop impact for employment counselors.** *Journal of Employment Counseling*, 1974(Dec), Vol 11(4), 160-165.—Used a modified intermittent reinforcement program in an attempt to maintain the heightened skills of employment counselors after they returned from a workshop setting to their work environment. The participants in the applied communication training workshop were assigned to a control group ( $n = 24$ ) and an experimental group ( $n = 12$ ). Contact by the trainer was established for the experimental group 1 wk after the close of the workshop and maintained for 3 mo. Contact with the control group was not made until the 3-mo follow-up test was administered. Comparison of pre- and posttest responses indicate that both groups improved their interpersonal communication skills as a result of the workshop. However, the 3-mo follow-up indicated that Ss who were not provided intermittent reinforcement showed a deterioration in skills, whereas Ss who were provided reinforcement maintained or improved their skills. The gain by the experimental group and loss by the control group were significant ( $p = .05$ ). It is suggested that educators should not assume that once a counselor is produced he will continue to function at the same or higher level. New approaches to maintaining skill effectiveness are recommended.—P. O'Brien.

9690. Klaus, Hanna. (St Louis U, Medical School) **The menopause in gynecology: A focus for teaching the comprehensive care of women.** *Journal of Medical Education*, 1974(Dec), Vol 49(12), 1186-1189.—Suggests that discussion of the meanings of loss of reproductive capacity (menopause) by natural and surgical means can be used to integrate several aspects of womanhood in a gynecologic teaching program for medical students. Hormonal and emotional aspects of menopause are discussed briefly, and attitudes toward surgical sterilization are noted.

9691. Knaggs, Sara J.; Barnes, Alan J. & Maclean, Charles B. (Emergency Dept Nurses Assn, East Lansing, MI) **The decision tree for teaching management of uncertainty.** *Journal of Medical Education*, 1974(Dec), Vol 49(12), 1184-1186.—Describes the "decision tree," (an outline of presenting symptoms and a reproducible logic for decision and action) which was developed for drug-misusing populations. The decision tree is recommended as an effective tool for helping diverse learners in health-care occupations choose the right course of action when diagnosis is uncertain.

9692. Left, J. P. (MRC Social Psychiatry Unit, Inst of Psychiatry, U London, England) **Transcultural influences on psychiatrists' rating of verbally expressed emotion.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 336-340.—Used reliability data from the International Pilot Study of Schizophrenia to explore differences in the way psychiatrists from the various centers perceived patients' verbal expression of emotion. Data was collected from psychiatrists' ratings on the Present State Examination (Depression, Anxiety, and Irritability scales). Psychiatrists from developed centers agreed with psychiatrists from developing centers in their perception of the degree of emotional differentiation shown by patients from developed centers. However, psychiatrists from developing centers saw their patients as exhibiting a relatively low degree of emotional differentiation, whereas their colleagues from developed centers rated them significantly higher in this respect. It is concluded that the assessment by the developing center psychiatrists is likely to be more accurate.—*Journal summary*.

9693. Levine, Frederic M. & Tilker, Harvey A. (State U New York, Stony Brook) **A behavior modification approach to supervision of psychotherapy.** *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 182-188.—Describes an approach in which supervision is geared towards developing a growing repertoire of effective therapeutic responses by the therapy trainee. Specific techniques are discussed. It is recommended that the supervisor initially attend therapy sessions with the trainee, and provide direct and unambiguous feedback regarding the trainee's therapeutic functioning. The supervisor should also help provide alternative ways for the trainee to deal with problem situations. Supervision should decrease as the trainee demonstrates increased competence.—C. P. McCreary.

9694. Lucena, José [Limits of the psychiatrist's function.] (Port) *Jornal Brasileiro de Psiquiatria*, 1972(Jan), Vol 21(1), 33-53.—Defines 3 major functions of the psychiatrist: (a) conceptual—to develop new knowledge in his field; (b) professional—to train new psychiatrists and manage relations with allied profession-

al groups; and (c) ethical—to study the moral and philosophical implications of his discipline. It is suggested that psychiatry must avoid 2 errors: reductionism, an excessive focus on the organic aspects of mental illness, and expansionism, an effort to take over too many functions belonging to other disciplines. It is considered difficult but not impossible to establish criteria for deciding when and to what extent other mental health disciplines may be given treatment responsibilities. Some further ethical problems inherent in the "new psychiatry" are noted. (English summary) (83 ref)—*D. J. Clair.*

9695. McCandless, Charles E. & Hicks, Rose. (Texas A&M U) **Counselors' perception of the legal implications of guidance services.** *Texas Personnel & Guidance Association Journal*, 1973(Mar), Vol 2(1), 31-38.—Attempted to determine how Texas counselors perceive the law in relation to counseling. A survey form was sent to 65 counselors in 13 counties, with 66% returns. Age of respondents was 40-49 yrs. The instrument presented 12 situations to which only 2 answers were possible. It is concluded that counselors responded in a legally appropriate manner. However, it is recommended that counselor education programs include or strengthen coverage of the legal implications of counseling.—*H. Crouch.*

9696. Mensh, Ivan N. (U California, Ctr for the Health Sciences, Los Angeles) **Consulting in medical, educational, and training settings.** *Professional Psychology*, 1974(May), Vol 5(2), 129-132.—Summarizes the curricula of programs in internship training, forensic psychiatry and psychology, advanced psychiatric residency, and community psychiatry as examples of concepts and practices in the education of health professionals. The principle objective of these programs is to increase the ability of the professionals to serve consultation and related functions in work with both other professionals and nonprofessionals. The role of the consultant is to assist the inquiring individual to define his consultation needs by asking the appropriate questions and to suggest solutions to the problems he poses, specifying the probable outcomes of the various options.—*B. Lindsey.*

9697. Musante, Gerard J. (Duke U, Medical Ctr) **Staff evaluations of the technician role.** *Professional Psychology*, 1974(May), Vol 5(2), 214-216.—Obtained evaluations of the functioning of psychological technicians, using questionnaire data from 21 psychology faculty and staff, all of whom had extensive contact with their respective technicians. The respondents rated the performance of the technicians on a 5-point scale, ranging from very poor (1) to very good (5). The mean ratings were 4.31 for test administration and 3.75 for behavioral observation. The respondents claimed that they used the behavioral observations of the technicians extensively to understand patient pathology and to write their reports, and that the availability of technician services enabled them to spend more time interviewing each patient. It was the opinion of 70% of the respondents that diagnostic testing by the technicians could and should be supplemented by the performance of other functions. In general, the respondents were quite pleased to have psychological technicians added to their work settings.—*B. Lindsey.*

9698. Naftulin, Donald H.; Donnelly, Frank A. & Wolkon, George H. (U Southern California, Medical School) **Selections of nuns for training as mental health counselors.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 366-369.—Conducted 2 surveys of Catholic nuns to determine the relationship between attitudes toward the use of authority-in-interviewing and rigidity in everyday life and the involvement of persons in training as primary counselors. 2 questionnaires mailed 3 yrs apart, elicited responses from 140 nuns. A 14-item scale, originally devised to measure the use of authority by physicians and now modified, was used. The 2nd instrument was the Gough Stanford Rigidity Scale. Relationships were found between authority scores and number of counseling courses taken and respondents actually counseling. It appears scales such as the ones described, although not especially useful for selection of counselors, are useful for placement of persons into the most appropriate type of counseling course and for course development.—*Journal summary.*

9699. Neufeld, Victor R. & Barrows, Howard S. (McMaster U, Hamilton, Ontario, Canada) **The "McMaster Philosophy": An approach to medical education.** *Journal of Medical Education*, 1974(Nov), Vol 49(11), 1040-1050.—Describes a university's approach to medical education which includes self-directed, problem-based, and small-group tutorial learning. The program also emphasizes diagnostic evaluation, the selective use of learning resources, and integrated learning and educational planning.

9700. Novak, David W. & Busko, Betty P. (Duke U) **Teaching old dogs new tricks: Issues in the training of family therapists.** *Psychiatric Forum*, 1974(Fal), Vol 4(2), 14-20.—Discusses basic issues and philosophies relevant to the training of family therapists. An efficient training model is presented along with alternatives for individuals not having access to a structured training program.

9701. Pankratz, Loren & Pankratz, Deanna. (VA Hosp, Portland, OR) **Nursing autonomy and patients' rights: Development of a nursing attitude scale.** *Journal of Health & Social Behavior*, 1974(Sep), Vol 15(3), 211-216.—Constructed a 69-item attitude scale which was administered to 702 nurses in 5 different settings. A principal components factor analysis results in 3 subscales that adequately represented the intent of the study: nursing autonomy and advocacy, patients' rights, and rejection of traditional rule limitations. The subscales clearly differentiated between the different samples of nurses. Higher scores were associated with education, leadership, academic setting, and nontraditional social climate. (22 ref)—*Journal abstract.*

9702. Patterson, Daniel Y. (Group Health Assn, Washington, DC) **How to avoid taking the boards but still save face.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 79-80.—Notes that position appointments for psychiatrists, as well as their eligibility to practice (or be paid for practice) may soon depend on certification or recertification. Several options are presented for psychiatrists who wish to avoid taking board examinations and still save face.—*Journal abstract.*

9703. Ramsden, Elsa L. (U Pennsylvania, School of Allied Medical Professions, Philadelphia) **Behavioral science in medical education: A learning model.** *Journal*

of *Medical Education*, 1974(Dec), Vol 49(12), 1182-1183. —Presents a new learning model for the study of behavioral science in medical education. The model emphasizes (a) observation of the work of practicing physicians and (b) a "self-critical process" which utilizes videotaped transactions between the medical student and patient.

9704. **Randolph, Daniel L.** (U Southern Mississippi) **Training the counselor as a behavioral consultant: A workshop model.** *Counselor Education & Supervision*, 1974(Dec), Vol 14(2), 147-150. —Describes a workshop model for training counselors to serve as behavioral consultants to teachers who use behavior modification techniques in the classroom. The 3-phase program, which involves simulated classes and videotaping, is outlined, and evidence of its effectiveness is noted.

9705. **Rezler, Agnes G.** (U Illinois, Medical School, Chicago) **Attitude changes during medical school: A review of the literature.** *Journal of Medical Education*, 1974(Nov), Vol 49(11), 1023-1030. —Reviews relevant literature to determine whether (a) medical students' interpersonal attitudes change from the first to the last year of medical school and (b) special teaching programs are capable of changing student attitudes in a specified direction. Findings suggest that the medical school environment fosters cynicism in medical students and that attitude changes induced by participation in special programs are temporary at best unless supported and reinforced by the total medical school environment. Implications of these findings for the selection of medical students and faculty are discussed. (21 ref) —*Journal abstract.*

9706. **Rhoads, John M.; Gallemore, Johnnie L.; Gianturco, Daniel T. & Osterhout, Suydam.** (Duke U, Medical Ctr) **Motivation, medical school admissions, and student performance.** *Journal of Medical Education*, 1974(Dec), Vol 49(12), 1119-1127. —Notes that admissions to medical school are based on selecting those students who excel in the physical and biological sciences. Whether such students will make the best physicians is a supposition that has been a major concern for admissions committees. In a follow-up study on 728 medical school admissions, medical students' basic science grades were compared with those from clinical rotations. It was ascertained that only about half of the students who excelled in the basic science portion of the curriculum did so in the clinical portion, while roughly 70% of students who excelled in the clinical sciences had not done so in the basic science area. Comparison of students in terms of admission data revealed minimal differences. Other findings suggest that motivation is the determining factor. Concern is expressed that present admission policies are likely to result in admissions committees' overlooking the "applied science" type of student. Possible solutions are offered, including the selection of students from schools of nursing. —*Journal abstract.*

9707. **Roazen, Paul.** (York U, Div of Social Science, Toronto, Ontario, Canada) **Reflections on ethos and authenticity in psychoanalysis.** *Human Context*, 1972(Fal), Vol 4(3), 577-587. —Replies in detail to criticisms by K. R. Eissler (see PA, Vol 49:7) of a book concerning Freud and V. Tausk (see PA, Vol 44:13564).

Rebuttal emphasizes the human and professional relationships between Freud and Tausk, based on testimony of witnesses who were actively involved.

9708. **Ross, Alan O.** (State U New York, Stony Brook) **Continuing professional development in psychology.** *Professional Psychology*, 1974(May), Vol 5(2), 122-128. —Proposes the development of continuing postdoctoral education facilities as a solution to the problem of professional obsolescence that has resulted from the recent marked increase in the number of new psychological techniques, methods, and orientations. The initial steps in this direction taken by the recently formed National Academy of Professional Psychologists are specified. It is observed that the universities have shown little interest in continuing professional education in psychology, raising issues of its format, staffing, and cost. In view of the likelihood that continuing professional education will become compulsory, it is recommended that particular attention be given to the meaningfulness of the courses to be required and to the unique needs of the student. —*B. Lindsey.*

9709. **Schwartz, Steven H. & Simon, Roger I.** (Wayne State U) **Differences in the organization of medical knowledge among physicians, residents, students.** *Journal of Structural Learning*, 1972, Vol 3(3), 37-50. —Asked 13 senior medical students, 13 residents and 13 physicians to sort cards containing symptoms (diseases) associated with shortness of breath into clusters that were "of diagnostic utility" to them. Hierarchical trees were constructed for each S's symptom and disease sorts and a number of quantitative measures were derived from these trees. In general, physicians' trees showed more vertical differentiation (levels) while residents exhibited more horizontal differentiation (branches per level). A 9-level classification scheme was developed to characterize the particular types of organizations used by Ss in sorting the symptoms (diseases). Considerable agreement was found between types of organizational schemes used on the 2 tasks, while a number of differences appeared between groups with differing experience. Physicians and residents seemed to use more types and more specific organizational schemes than did students. Possible implications for medical education are mentioned. (17 ref) —*Journal abstract.*

9710. **Sloop, E. Wayne & Quarrick, Eugene.** (Lynchburg Training School & Hosp, VA) **Technician performance: Reliability and validity.** *Professional Psychology*, 1974(May), Vol 5(2), 216-218. —Assessed technician functioning from an uninvolved, objective point of view. 2 psychological technicians and a number of graduate student trainees tested the same children with academic and emotional disorders and/or retested children on the same instruments after intervals ranging from 4 to 48 mo, producing a total of 124 test-retest comparisons. Only slight differences were found in the overall testing behavior of the 2 types of examiners. With regard to validity, technicians and students correlated .90 on the Stanford-Binet Intelligence Scale and .83 on the WISC. The test-retest reliability coefficients for technician-technician and technician-student comparisons were .82 on the Stanford-Binet, .87 on the WISC Verbal scale and .84 on the WISC Performance Scale ( $P < .01$ ). It is concluded that both the technicians and the students

demonstrated a capability for obtaining valid and reliable data from test administration.—*B. Lindsey.*

9711. **Small, S. Mouchly.** (State U New York, Medical School, Buffalo) **Limitations and values of evaluation techniques in psychiatric education.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 52-55.—Summarizes the major evaluation techniques now available in psychiatric education and discusses the values and limitations of each. It is concluded that only by the use of many evaluation instruments during the resident's training can some estimate of clinical competence be approached. Even with this multiplicity of testing instruments, the validity of predictions of a psychiatrist's performance can be determined only in terms of probabilities.—*Journal abstract.*

9712. **Smith, Darrell.** (State University Coll New York, Oneonta) **Integrating humanism and behaviorism: Toward performance.** *Personnel & Guidance Journal*, 1974(Apr), Vol 52(8), 513-519.—Current emphasis on performance criteria in counselor training programs and in professional services poses a serious threat to the professional and paraprofessional whose orientation is humanistic. Training in the self-actualizing psychologies of A. Maslow and C. Rogers has led many psychologists to equate competency-based education and psychology with behaviorism, and therefore to resist the demand for performance criteria and the adjunct behavioral principles. A behavioral humanism is suggested as the solution to the dilemma, and guidelines are proposed for formulating and implementing such a synthetic system without jeopardizing personal-professional integrity.—*J. F. McIlwaine.*

9713. **Suinn, Richard M.** (Colorado State U) **Traits for selection of paraprofessionals for behavior-modification consultation training.** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 441-449.—Attempted to specify the characteristics associated with success in behavior-modification consultation. Ss were 34 undergraduates recommended for training on the basis of their being academically solid enough to learn and apply principles, responsible, mature, capable of thinking analytically, and aware of their own limitations. 20 were accepted following the screening interview and administered psychometric tests (e.g., the Edwards Personal Preference Schedule). The training procedures, the psychometric and other selection measures, and statistical results when comparing the selection tools with different criteria are discussed. (15 ref)—*Journal abstract.*

9714. **Tageson, Carroll W. & Corazzini, John G.** (U Notre Dame) **A collaborative model for consultation and paraprofessional development.** *Professional Psychology*, 1974(May), Vol 5(2), 191-197.—Describes an in-service training program for Head Start social worker aides (paraprofessionals) who had been originally recruited from the target populations they were slated to serve. A nonauthoritarian, group-centered approach was utilized with the 17 trainees, and the training sessions immediately assumed a case-work orientation. Leader interventions were directed toward enabling the trainees to become more aware of their inherent advantages for effective communication with their target populations and to make fuller use of their own resources for problem resolution. 5 general movements and outcomes of the

training sessions are specified. It is concluded that the professional and the paraprofessional can engage in a mutually consultative relationship which allows the paraprofessional to perform tasks appropriate to his unique competencies.—*B. Lindsey.*

9715. **Todd, Thomas W.; Rossiaky, Pamela B. & Ballou, Brynn.** (University Affiliated Cincinnati Ctr for Developmental Disorders, OH) **Survey of need for a new professional: The clinic liaison educator.** *Health Services Reports*, 1974(May), Vol 89(3), 230-235.—Presents data from a survey of the directors of 32 mental retardation and 32 psychiatric clinics, regarding the need for an educator to work in clinics and provide liaison with schools.

9716. **Uhlman, Gerald E.** (Haile Selassie I U, Faculty of Medicine, Addis Ababa, Ethiopia) **Incidence of vasectomies refused and reasons for refusal.** *Public Health Reports*, 1974(Sep-Oct), Vol 89(5), 447-450.—Surveys refusals by 108 private physicians and 77 vasectomy clinics to perform vasectomies, with the reasons given for contraindications.

9717. **Vockell, Edward L. & Asher, William.** (Purdue U, Calumet Campus) **Perceptions of document quality and use by educational decision makers and researchers.** *American Educational Research Journal*, 1974(Sum), Vol 11(3), 249-258.—Selected 102 documents containing empirical research from the 1971 entries in the *Research in Education* dissemination service of the Educational Resources Information Center. These reports were presented to a group of educational research specialists and to a group of educational decision makers for an assessment of their quality. The decision makers perceived the reports to be of significantly higher quality than did the research specialists. The 2 groups gave divergent reasons for acceptance or rejection of a report.—*Journal abstract.*

9718. **Wagenfeld, Morton O.; Robin, Stanley S. & Jones, James D.** (Western Michigan U) **Structural and professional correlates of ideologies of community mental health workers.** *Journal of Health & Social Behavior*, 1974(Sep), Vol 15(3), 199-210.—Examined (a) community mental health ideological variations among 893 staff members in a national sample of community mental health centers, (b) Ss' perceptions of their organization's position on a social service-medical continuum, and (c) relationships between ideology and organizational structures. Results indicate highest ideological adherence within rural areas, under agency-board structures, among social workers and psychologists, and among those positioning their organizations closer to social than medical services. Ideological adherence appeared to be more a function of professional association than of organizational affiliation. Theoretical and policy implications of these findings are discussed. (34 ref)—*Journal abstract.*

9719. **Walker, Harry A.; Gerjuoy, Herbert & Burstein, George.** (Rockland Children's Psychiatric Ctr, Orangeburg, NY) **Occupational therapy: Job analysis of tasks of certified assistants and registered therapists.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 907-914.

9720. **Ward, G. Robert.** (U Houston) **Theoretical orientation influences the assessment of counselor effectiveness.** *Counselor Education & Supervision*,

1974(Dec), Vol 14(2), 150-154.—3 professional counselors with psychoanalytic, behavioral, or goal orientations rated video- and audiotapes of practicum counseling sessions. Data support the suggestion that experienced counselor educators with different counseling orientations evaluate counselor effectiveness differently, and that the philosophical viewpoint of professional counselors may be more salient than previously recognized.

9721. Wise, Thomas N. (Johns Hopkins Hosp, Baltimore, MD) **Utilization of a nurse consultant in teaching liaison psychiatry.** *Journal of Medical Education*, 1974(Nov), Vol 49(11), 1067-1068.—Presents clinical experiences of liaison nurses to illustrate the effectiveness of such a practice in supporting the proper care of patients. It is suggested that, by having a consultant nurse within a liaison service working in a role parallel to that of a medical staff member and not as a substitute or surrogate physician, the responsibilities and difficulties of nursing in the management of emotional reactions to illness can be eased.—*M. Pounsel.*

## PHYSICAL AND PSYCHOLOGICAL DISORDERS

9722. Hynle, J. (U Karlova, Fakulta všeobecného lékařství, Prague, Czechoslovakia) **[Factors of sexual differentiation.]** (Czec) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 72-79.—Discusses the influence of chromosome sets, sex hormones, cerebral centers governing hormonal delivery, and early life experiences on pathological sexual development. Studies of imprinting in birds are quoted as relevant to psychoanalytical claims that dispositions toward some interpersonal and sexual patterns originate in infancy. How patients feel about their sexual problems is important, and the therapist is asked to be sensitive, tactful, and compassionate. (Russian & English summaries) (24 ref)—*V. Fischmann.*

9723. Meyer, Jon K. (Johns Hopkins Medical Inst, Psychiatric Liaison Service, Baltimore, MD) **Clinical variants among applicants for sex reassignment.** *Archives of Sexual Behavior*, 1974(Nov), Vol 3(6), 527-558.—Considers that loose usage of the term "transsexualism" and limitations of the diagnostic categories transsexualism, transvestism, and homosexuality as applied to applicants for sex reassignment have created difficulties in evaluation, disposition, and follow-up. Patients falling into the gray areas between diagnostic categories are more common than those fitting existing typologies. A description of 87 patients from 1 series and a broader diagnostic scheme for their classification are offered. It is suggested that the condition of sufficient gender discomfort, skew, or unease to request sex reassignment be recognized as the "gender dysphoria syndrome"; advantages and characteristics of this category are examined. (25 ref)—*Journal abstract.*

9724. Nedoma, K. (Sexuologický ústav Fakulty Všeobecného lékařství, Prague, Czechoslovakia) **[Psychosexual infantilism and PPG diagnostics.]** (Czec) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 96-101.—Revives the diagnostic concept of "psychosexual infantilism," originated 50 yrs ago in writings of A. Kronfeld, M. Hirschfeld, W. Stekel, and others. The

clinical picture is described and the syndrome classified as a nosological entity whose principal feature is the lack of differentiation in the choice of sexual objects and activities. Based on phalloplethysmographic tests of 100 patients, 4 kinds of psychosexual infantilism are identified. (Russian & English summaries)—*V. Fischmann.*

9725. Pauly, Ira B. (U Oregon, Medical School, Portland) **Female transsexualism: II.** *Archives of Sexual Behavior*, 1974(Nov), Vol 3(6), 509-526.—Discusses the psychological and psychiatric evaluation, biological data, and treatment of females who wish to become men, using data from 80 cases of female transsexualism reported in the world's literature. Characteristics of the female transsexualism syndrome are outlined, emphasizing the family background and natural history of the disorder. Findings suggest that, in female transsexualism, there is an identification with a masculine but abusive father, while the mother is perceived as weak, less admirable, emotionally unavailable, and in need of protection from the father. A protective attitude develops toward the mother, which has all the dynamics of the oedipal relationship between father and son. The decision to treat the transsexual by offering sex reassignment surgery and other hormonal and psychiatric treatment is still controversial. It is concluded that transsexualism would be far better prevented than treated and that parents should be made more aware of the need to positively reinforce behaviors and gender characteristics consistent with biological sex of the infant. (3½ p ref)—*Journal abstract.*

9726. Sandgrund, Alice; Gaines, Richard W. & Green, Arthur H. (State U New York, Downstate Medical Ctr, Div of Child & Adolescent Psychiatry, Brooklyn) **Child abuse and mental retardation: A problem of cause and effect.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 327-330.—Investigated the impact of child abuse on cognitive development by comparing 60 physically abused, 30 neglected, and 30 nonabused (control) children who were matched for age, sex, and socioeconomic status. Both the abused and neglected Ss were found to have significantly lower IQs than control Ss with substantial percentages in the mentally defective range; however, the hypothesis that the abused children would manifest the greatest impairment was not supported.—*Journal abstract.*

9727. Sturm, I. E. (VA Hosp, East Orange, NJ) **Toward a composite psychodiagnostic report outline.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 6-7.—Presents a standard outline for psychodiagnostic reports including both psychodynamic and behavioral components.

## Mental Disorders

9728. Abrams, Richard; Taylor, Michael A. & Gaztanaga, Pedro. (State U New York, Stony Brook) **Manic-depressive illness and paranoid schizophrenia: A phenomenologic, family history, and treatment-response study.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 640-642.—In a prospective study to assess the validity of paranoid schizophrenia as a diagnostic subtype, an admission diagnosis of paranoid schizophrenia was noted in 41 of 247 consecutive admissions to an acute-treatment psychiatric inpatient unit. Only 2 of

these 41 satisfied research criteria for schizophrenia, whereas half satisfied research criteria for mania. The group whose conditions were rediagnosed as manic was compared with a group of 33 schizophrenic and manic patients for whom admission and research diagnoses concurred. Noticeable differences from the former group and almost no differences from the latter group were found for demographic, genetic, phenomenologic, and treatment-response variables. Data suggest that many patients whose conditions are diagnosed as paranoid schizophrenia actually suffer from an affective illness and rarely satisfy rigorous criteria for schizophrenia.

—*Journal abstract.*

9729. Adair, Bill. (Ministry of Community & Social Services, Province of Ontario, Toronto, Canada) **The role of recreation in assessing the needs of emotionally disturbed youth.** *Journal of Leisureability*, 1974(Oct), Vol 1(4), 25-33.—Proposes the use of recreational activities in the evaluation of personality and social attributes of emotionally disturbed youth. Techniques include (a) observation—use of choice situations in play to observe social skills, interactional patterns, and play habits; (b) interviews to elicit the child's assessment of situations that have arisen in play; and (c) skill testing which measures perceptual-motor ability. Information gained is used to identify the child's needs and to develop treatment plans and goals. It is noted that this assessment should be an ongoing, recorded process which interacts with other aspects of therapy.—*C. Wright.*

9730. Ammon, Günter. [The psychodynamics of the psychoses, the symbiosis-complex and the spectrum of the archaic ego-illnesses.] (Germ) *Dynamische Psychiatrie*, 1973, Vol 6(6), 355-372.—Contends that the decisive factor in the pathogenesis of psychoses and other archaic illnesses of the ego lies in a disturbance of the early symbiotic stage of mother and child relationship in a primary group which is unable to communicate and experience. Archaic ego-disturbances are viewed as 1 pole of a gliding spectrum of psychic diseases, the other pole of which is represented by oedipal neuroses. The possible existence of etiological somatic factors is acknowledged but considered inaccessible and of no appreciable value for therapeutic purposes. The development of ego boundaries and the ego require the mother's experiential capacity and the protection and assistance of the primary group. Without help from a primary group, the child protects the weak ego-boundaries by splitting off experiential areas in the ego, thus creating an ego deficit, a hole in the ego, and developing a compensatory specific symptomatology which is determined by the time and duration of the trauma and the pathogenic type of the mother. The goal of the therapy must be to reintegrate the deficient ego. (English summary) (45 ref)—*T. Fisher.*

9731. Arieti, Silvano. **Acting out and unusual behavior in schizophrenia.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 333-342.—Views acting out among schizophrenic patients as being connected with special cognitive processes such as active concretization, delusional thinking, and hallucinations. The patient is still capable of conceiving abstract ideation but cannot sustain it; it is too anxiety-provoking. The schizophrenic is seen as similar to the dreamer,

the painter, and the poet, all of whom transform abstract concepts into concrete representations or perceptual images. Contrary to what happens in artistic productions, however, the schizophrenic's abstract level is lost or completely replaced by the concrete form. Case examples of how active concretizations appear in actions are presented. Schizophrenics are classified into 3 categories according to the dominant psychopathology: (a) disinhibition of masochistic trends; (b) part of a depressive syndrome; and (c) acting out of commands or ideas suggested by the delusional ideas, hallucinations, etc. Suicide among these 3 types of patients is discussed. Other recurring symptoms are also cited. Suggestions are made for treatment. (17 ref)—*R. S. Albin.*

9732. Balestrieri, A.; Zimmermann-Tansella, C.; Tansella, M. & Scitiliani, O. (U Padova, Istituto di Clinica Psichiatrica di Verona, Italy) [Hysterical amnesia.] (Germ) *Psychiatria Clinica*, 1974, Vol 7(1), 16-25.—Discusses a nosographical collection of hysterical amnesias, their phenomenology, and their psychodynamic pathogenesis. A case of general amnesia, with special reference to similar cases in the literature, is described. (24 ref)—*English abstract.*

9733. Barocas, Ralph & Black, Harvey K. (U Rochester) **Referral rate and physical attractiveness in third-grade children.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 731-734.—Studied rates of referrals for psychological assessment, speech, reading, and learning disability in 54 male and 46 female 3rd-grade children. Boys were referred more than girls, and children judged by 50 undergraduates as physically attractive by ratings of photographs received significantly more referrals than their less attractive classmates. Differential consequences of appearance on interpersonal responsiveness are discussed with emphasis upon access to intervention programs as a function of appearance.—*Journal abstract.*

9734. Basu, Asit K. & Sen Mazumdar, D. P. **A study of the objective scoring system of Kahn Test of Symbol Arrangement (KTSA) for screening effectiveness.** *Indian Journal of Clinical Psychology*, 1974(Mar), Vol 1(1), 23-28.—Examined 18 objective scoring criteria of the KTSA to determine the test's validity in discriminating between pathological groups. 20 male chronic schizophrenics, 20 male epileptics, and 20 male controls were administered the KTSA. Results indicate that 7 criteria achieved statistical significance. While all 7 criteria significantly differentiated between schizophrenic and control groups, 4 criteria significantly differentiated between the epileptic and control groups, and only 1 criterion significantly differentiated between the schizophrenic and epileptic groups. Because of the limited usefulness of these objective criteria, it is recommended that they serve as a supplementary scoring system.—*F. S. Beyer.*

9735. Beck, Aaron T.; Weissman, Arlene; Lester, David & Trexler, Larry. (U Pennsylvania) **The measurement of pessimism: The Hopelessness Scale.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 861-865.—Administered a scale designed to quantify hopelessness to 294 hospitalized suicide attempters, 23 general medical outpatients, 62 additional hospitalized suicide attempters, and 59 depressed psychiatric patients. The scale had a Kuder-Richardson-20 internal consistency

cy coefficient of .93 and correlated well with the Stuart Future Test (SFT) and the pessimism item of the Beck Depression Inventory (BDI; .60 and .63, respectively). The scale was also sensitive to changes in the patient's state of depression over time, as evidenced by a correlation of .49 with change scores on the SFT and .49 with the change scores on the BDI. Findings also indicate that depressed patients have an unrealistically negative attitude toward the future and that seriousness of suicidal intent is more highly correlated with negative expectancies than with depression. A principal-components factor analysis revealed 3 factors which tapped affective, motivational, and cognitive aspects of hopelessness. (16 ref)—*L. Gorsey.*

9736. **Benedetti, Gaetano.** (U Basel, Psychiatric Clinic, Switzerland) **Intrapsychic aspects of schizophrenic psychopathology.** *Dynamische Psychiatrie*, 1973, Vol 6(6), 391-404.—Examines pathology of the ego, in particular the splitting of the ego as the starting point for the understanding of those psychodynamic mechanisms that distinguish schizophrenia from neurosis. Schizophrenia is interpreted as a defect of intrapsychic integration brought about by unknown causes, presumably both psychogenetic and biohereditary. The defect manifests itself as psychopathology only after having passed through psychodynamic mechanisms in which the reaction of the ego and the environment to the disease constitute an essential part of the disease itself. (German summary) (1 p ref)—*T. Fisher.*

9737. **Berg, Ian et al.** (U Leeds, England) **Bipolar manic-depressive psychosis in early adolescence: A case report.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 416-417.—Describes the case of a girl who had typical bipolar manic-depressive psychosis beginning unusually early at age 14 yrs. Treatment with lithium, the course of the illness, and the fact that the patient's father also had bipolar manic-depressive illness are briefly discussed.

9738. **Binder, Jeffrey & Krohn, Alan.** (U Michigan, Medical Ctr) **Sexual acting out as an abortive mourning process in female adolescent inpatients.** *Psychiatric Quarterly*, 1974, Vol 48(2), 193-208.—Discusses one of the clearly definable psychodynamic constellations that underlie sexual acting-out—an abortive mourning process in response to separations or losses suffered by female adolescent inpatients. J. Bowlby's theory (see PA, Vol 39:1933) of the mourning process is emphasized in understanding the immediate reaction to loss. Case material is presented in support of the hypothesis that with some disturbed female adolescents, heterosexual acting-out wards off a regressive wish, kindled by object loss, to reunite symbiotically with the pre-oedipal mother. (25 ref)—*Journal abstract.*

9739. **Blum, Alexander.** (Free U, Psychiatric & Neurological Clinic, Berlin, W Germany) **[An epidemic of attacks in a group of Yugoslav workers.]** (Germ) *Nervenarzt*, 1972(Apr), Vol 43(4), 192-197.—Investigated the causes and triggering mechanisms of an epidemic of psychic disturbances of various types among 76 residents of a Berlin home for female guest workers. Ss were 15 affected women and 15 nonaffected controls, all 18-38 yrs old and physically healthy who had arrived only a few months earlier from a small town in Yugoslavia. The

observed phenomena were analyzed with particular attention to the effects of sudden changes in the environment of Ss. The backgrounds of both groups were examined and compared for relevant, possibly determining factors (home, school, heredity, family, health, social adjustment, etc). From the "soft" data obtained, a global comparison of the groups was made which indicated 70% more relevant factors in the group of affected Ss, although the number of relevant factors also was high in the control group. Yugoslav guest workers appear to include many who work abroad because of maladjustment at home; for some of these persons the new environment may trigger a previously latent symptom, while in others it is beneficial and healing.—*T. Fisher.*

9740. **Broekma, Victor & Rosenbaum, Gerald.** (U Wisconsin) **Cutaneous sensitivity in schizophrenics and normals under two levels of proprioceptive arousal.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 30-35.—Compared the cutaneous sensitivity of 20 normals and 20 schizophrenics (mean ages—30.5 and 30.2 yrs, respectively) under conditions of relaxation and of muscle tension. Schizophrenics were less sensitive than normals to cutaneous cues. Schizophrenic-normal differences were maximized at the most peripheral, least cortically represented of the physical locations sampled. No significant effects on cutaneous sensitivity were produced by muscle tension as opposed to relaxation. (28 ref)—*Journal abstract.*

9741. **Buck, Carol.** (U Western Ontario, London, Canada) **One gene vs. two genes in schizophrenia.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 348-349.—Compared the frequencies of schizophrenia in the parents and siblings of schizophrenics predicted by E. Slater's (1971) single-gene model with those predicted by J. L. Karlsson's (1966) 2-gene model. Statistical analysis suggests that the frequencies predicted by Slater's model are appreciably closer to the observed frequencies than those derived from Karlsson's model, and justify the rejection of the 2-gene theory in favor of a single gene with modified dominance.—*L. Gorsey.*

9742. **Bull, H. C. & Venables, P. H.** (Birkbeck Coll, U London, England) **Speech perception in schizophrenia.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 350-354.—Presented standard lists of phonetically balanced words and lists of low-pass filtered speech (i.e., words from which all sounds above 500 Hz had been filtered out) at 80 and 60 db to a total of 90 male paranoid and nonparanoid schizophrenics and normal controls in 2 experiments. Each S was tested for auditory acuity, and no significant differences were found in either these results, or in age and Mill Hill Vocabulary Scale scores. Results suggest that schizophrenics show an impairment in perception of speech sounds compared with controls and that this difference is more marked in filtered than in unfiltered speech and at low rather than high intensities. No support was obtained for the prediction that this impairment would be associated with the presentation of stimuli to the left rather than to the right cerebral hemisphere.—*L. Gorsey.*

9743. **Cattell, Raymond B.** **An analysis of state and trait change factors in pathology by dR-technique on the CAQ.** *Indian Journal of Clinical Psychology*,

1974(Mar), Vol 1(1), 34-40.—administered the Clinical Analysis Questionnaire (CAQ) to 179 normal and clinical patients to investigate the nature of state change. The CAQ consists of 16 normal scales and 12 pathological scales, 5 representing the MMPI and 7 representing depressive and hypochondriacal pathology. Ss were retested after 1 mo. The 28 factors were split into 56 variables in order to test the hypothesis of 28 primary factors. Difference scores were factored using dR (differential R) technique. Results indicate that the number and nature of states corresponds to results previously found for traits, using the 16 normal and 12 pathological dimensions. One exception was 2 depression dimensions which indicated more common factors.—F. S. Beyer.

9744. Cellesi, M. & Giordano, D. (U Genoa, Istituto di Psicologia della Facoltà Medica, Italy) [Nervous vomiting.] (Ital) *Medicina Psicosomatica*, 1972(Jul), Vol 17(3), 229-239.—Studied 4 5-10 yr old victims of nervous vomiting and identified similar psychodynamic factors, family situations, and personalities in each case. (English & French summaries)

9745. Clum, George A. (U Virginia, Medical School) **Relations between biographical data and patient symptomatology.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 80-83.—Performed a correlational analysis of the relation between item clusters derived from a biographical inventory, the MMPI, and the factors derived from the Katz Adjustment Scales. Ss were 117 psychiatric inpatients, 18-65 yrs of age. Data confirm the expected relations between life history clusters and symptomatology. The factor of Social and Familial Alienation was related to both affective symptoms and more stable personality characteristics. A history of acting out was related to a tendency to emphasize Psychopathology, Masculine Interests, and the character disorder dyad of Psychopathic Deviancy and Hypomania. Age and social status also yielded expectable results, although they tended to be less consistently related to personality variables.—*Journal abstract.*

9746. Cohen, Donald J.; Shaywitz, Bennett A.; Johnson, Warren T. & Bowers, Malcolm. (Yale U, Child Study Ctr) **Biogenic amines in autistic and atypical children.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 845-853.—Studied central nervous system biogenic amine metabolism in 35 3-11 yr old children suffering from autism, atypical development, epilepsy, and movement disorders. After oral administration of probenecid, a membrane blocking compound, a cerebrospinal fluid (CSF) sample was obtained for assay of homovanillic acid (HVA), 5-hydroxyindoleacetic acid (5HIAA), and probenecid. The concentrations of HVA and 5HIAA in the CSF were thought to reflect the rate of formation in the brain of their parent amines, dopamine and serotonin, respectively. There were statistically significant differences in CSF HVA and 5HIAA levels between the psychotic and epileptic children. The HVA and 5HIAA were significantly correlated with each other. Each of these acid metabolites covaried with the CSF levels of probenecid. Interpretation of the significance of CSF HVA and 5HIAA requires simultaneous measurement of probenecid concentration. (29 ref)—*Journal abstract.*

9747. Croughan, Jack L.; Weiner, Amos & Robins, Ell. **The group of schizoaffective and related psychoses—critique, record, follow-up, and family studies: II. Record studies.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 632-637.—Describes a record study on the group of schizoaffective and related psychoses. Data were presented for 2 groups of 204 inpatients. Both manifested at least 2 types of thought and behavior disorders, but only the 1st group had, at the same time, sufficient affective symptoms to meet clinical research criteria for depression or mania. The most important similarities for both groups were the high frequencies of chronic illness, delusions of persecution, and auditory hallucinations. There was little doubt that patients in the 2nd group had paranoid schizophrenia. On the other hand, patients in the 1st group cannot be regarded as having typical paranoid schizophrenia because of having met criteria for affective disorder, and because the chronic course was manifested substantially more by affective symptoms than the 2nd group. (24 ref)—*Journal abstract.*

9748. Cytryn, Leon; McKnew, Donald H.; Logue, Mayada & Desai, Ramesh B. (Children's Hosp of the District of Columbia) **Biochemical correlates of affective disorders in children.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 659-661.—In a preliminary study, 9 6-12 yr old children with affective disorders were studied during a 2-3 wk hospitalization. Biochemical as well as behavioral data were collected. The urinary metabolites studied were norepinephrine, vanillylmandelic acid, and 3-methoxy-4-hydroxyphenylethyl glycol. Deviations from values in normal controls were found in all the Ss but were most apparent in those with chronic affective disorders. This suggests that clinical investigation of the biology of such childhood disorders may be relevant for issues of cause or treatment as they have been in adult affective disorders. (18 ref)—*Journal abstract.*

9749. Daun, H. (U Erlangen, Neuro & Polyclinic, W Germany) [About the formal genesis of psychoses.] (Germ) *Fortschritte der Neurologie, Psychiatrie und ihrer Grenzgebiete*, 1973(Jan), Vol 41(1), 1-52.—Discusses the theoretical concept that mental activity proceeds in an orderly and systematic fashion, a rigid framework in which defined and special mental functions have to follow certain described sequences and are connected in such a way that in each case an afferent and an efferent function are paired. Psychopathological disorders, therefore, must be a manifestation of irregular and disturbed psychic functions. A model is developed which is based on both psychological and psychopathological experience and data showing the mutual correspondence between normal mental processes and the formal genesis of psychoses. (English summary) (37 ref)—T. Fisher.

9750. de Freitas, Otavio & Soriano Wanderley, Nelson. (U Federal do Rio de Janeiro, Faculdade de Medicina, Brazil) **An inventory of psychiatric symptoms (IPS).** (Port) *Jornal Brasileiro de Psiquiatria*, 1972(Jan), Vol 21(1), 55-80.—Presents the initial version of a 140-item (14-scale) personality inventory, empirical validation type, for individual and group use. The validation group included 179 normals, 58 neurotics, 32 schizophrenics, and 42 epileptics. Total scores of all the groups are

compared, and 9 selected individual profiles are reproduced and analyzed.—D. J. Clair.

9751. Depue, Richard A. & Woodburn, Larry. (Southern Illinois U, Carbondale) **Disappearance of paranoid symptoms with chronicity.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 84-86.—Investigated the finding of a reduced proportion of paranoids in chronic samples. Whether this change is due to the disappearance of paranoid patients or of paranoid symptomatology is unclear. Data from 50 multi-admitted paranoid schizophrenics firmly support the notion that paranoid symptomatology disappears. Although half of the patients remained paranoid across 10 yrs of illness, the other half changed to nonparanoid status around the 3rd hospitalization and about 6 yrs after 1st admission.—*Journal abstract*.

9752. Dettmerring, Peter. [The patient and his relatives: Family problems in a social psychiatric class.] (Germ) *Praxis der Psychotherapie*, 1973(Jun), Vol 18(3), 114-117.—Reviews 4 case histories to illustrate family problems of psychiatric patients.

9753. Dobrzański, Tadeusz. (State Jan-Mazurkiewicz Hosp, Warsaw, Poland) **Endocrine alterations in delirium tremens.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1205-1211.—Studied endocrine function in 128 23-67 yr old men with delirium tremens after an overnight fast and again 7 days later. None had a history of endocrinological disorders. From their initial plasma hormone levels, the patients were categorized into 3 groups. According to the classification of alcohol withdrawal syndromes by M. M. Gross et al, 32 Ss were rated at 3+ or more clouding of sensorium and at 3+ or more hallucinations (disoriented for time by more than 2 days and with auditory and visual hallucinations both present but not fused); 39 at 3+ or less clouding of sensorium and at 2+ hallucinations; and 49 at 2+ clouding of sensorium and 3+ or less hallucinations. Results indicate a relationship between the psychopathological syndrome in delirium tremens and endocrine alterations. It is suggested that the alterations are a consequence of the effects of stress in these patients and that they are not a primary cause of the psychosis. (26 ref)—*Journal abstract*.

9754. Doležal, V. & Hausner, M. (U Karlova, Fakulta všeobecného lékařství, Prague, Czechoslovakia) [Key-structure of the N-5 questionnaire from the psychopharmacological and psychotherapeutic point of view.] (Czec) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 88-95.—Examined the N-5 questionnaire, designed by 2 Czech psychiatrists for the study of neurotic symptomatology. Factor analysis of questionnaire results from 240 patients before and after psycho- and pharmacotherapy, indicates 5 basic clusters of symptoms: 1 key factor referring to disturbances of self-evaluation and 4 peripheral factors identified as Anxiety-Depression-Neurasthenia, Psychophysiologic Cluster, Obsession-Compulsion-Phobia, and Aggression-Hostility. Findings support M. Ostow's 1962 concept of psychoenergetics and psychodynamics. Revision of the N-5 or construction of a new questionnaire is recommended. (Russian & English summaries) (17 ref)—V. Fischmann.

9755. Dornič, Stanislav & Birbaumer, Niels. (U Stockholm, Inst of Applied Psychology, Sweden) **Inform-**

**ation overload and perceived difficulty in "neurotics."** *Reports from the Institute of Applied Psychology, University of Stockholm*, 1974, No 49, 5 p.—Investigated the perception of difficulty of a task involving high information load, in which Ss had to determine whether or not a series of complex visual items contained a given code. The experimental variable was the rate of presentation of the task (i.e., the amount of "time-stress"). The performance of a group of 28 neurotic outpatients was compared with that of 31 normal, matched controls. Results show that in the control group perceived difficulty was a linear function of the rate of presentation, while in the experimental group perceived difficulty increased as a positively accelerated function of the time available to solve a task.—*Journal abstract*.

9756. Draguns, Juris G. (Pennsylvania State U) **Values reflected in psychopathology: The case of the Protestant ethic.** *Ethos*, 1974(Sum), Vol 2(2), 115-136.—Discusses the influence of the Protestant ethic on the nature of manifestations of psychopathology and on social responses to psychopathology. It is suggested that distinctive cultural values are expressed in psychopathological behavior as well as in socially appropriate and desirable behaviors. (5 p ref)

9757. Drietomsky, Eugen & Brunecker, Georgina. (Simmelweis Medizinischen U, Lab für Psychiatrie, Budapest, Hungary) [The question of the nosological entity of endogenic psychoses.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Apr), Vol 26(4), 217-222.—Reports successful application of K. Leonhard's differential classification of manic-depressive illness. The conjecture is offered that the nosological autonomy of atypical forms of endogenous psychoses can be delimited on the basis of the course of a particular symptomatology.

9758. du Pasquier, J. [Handwriting and fantasy: Death of the father and handwriting.] (Fren) *Pratique des Mots*, 1974(Mar), No 15, 7-15.—Presents a psychoanalytic analysis of handwriting difficulties. Paper, writing instrument, and code (language) are seen as potential symbols for the child, who is thought to fear mutilation and frustration from a symbolic father.

9759. Faltus, F. (U Karlova, Prague, Czechoslovakia) [Fear of obesity and of growing up.] (Czec) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 124-127.—Discusses the significance of fear of obesity and fear of physical maturation, found in 29 women having anorexia nervosa. The clinical impression is that fear of obesity is common in both sick and healthy women. Negative feelings about developing breasts and hips, menstruation, and the feminine look and role in general seem to occur more frequently in sexually maturing young patients with anorexia nervosa. It is concluded that fear of growing up is a significant etiopathogenic factor of functional anorexia. (Russian & English summaries) (23 ref)—V. Fischmann.

9760. Fenz, Walter D.; Young, Michael J. & Fenz, Hans G. (U Waterloo, Ontario, Canada) **Differences in the modulation of cardiac activity between psychopaths and normal controls.** *Psychosomatic Medicine*, 1974(Nov-Dec), Vol 36(6), 488-502.—Conducted a study of 15 primary and 15 secondary psychopaths to investigate the prediction that psychopaths would show a

deficit in developing an adaptive modulation of autonomic and, more specifically, heart rate activity in relation to a source of stress. When presented with a series of signals warning of a forthcoming noxious event, Ss showed resistance to develop anticipatory cardiac responses to them; having developed a conditioned response pattern, they then showed resistance to extinction. This delay in responding to changes in the environment, especially to anxiety-relevant cues, was attributed to a selective deficit in attention. Findings are related to studies on "real-life" stress in which the development of anticipatory emotional responses had adaptive effects on performance. (24 ref)—*Journal abstract*.

9761. Fischer, Paul; Laass, Wolfgang; Starke, Gunter & di Poi, Gerhard. (Karl-Marx-U, Medizinisch-Poliklinisches Inst, Leipzig, E Germany) [The importance of psychic disorders in students.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(May), Vol 26(5), 302-313.—Reports on diagnosis and treatment of 133 students during the 1972-1973 academic year at Karl Marx University, Leipzig. Students with psychic disorders usually consulted an internist or general practitioner rather than a psychiatrist. Psychological tests were helpful in diagnosing those cases where organic disorders had been ruled out. Since as many as 5% of the students may develop psychic disorders during their years of study, establishment of a student health center for such disorders is recommended.—K. J. Hartman.

9762. Friedman, Eitan; Shopsin, Baron; Sathananthan, Gregory & Gershon, Samuel. (New York U, Medical Ctr, Neuropsychopharmacology Research Unit) Blood platelet monoamine oxidase activity in psychiatric patients. *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1392-1394.—Measured monoamine oxidase (MAO) activity in blood platelets of 13 male and 10 female normal control Ss and 23 male and 15 female patients with schizophrenia or other psychiatric diagnoses. No differences were found among the groups as a whole. However, in the control group, women had significantly higher enzyme activity than men. Female schizophrenic patients showed a trend toward lower activity than did female control Ss, but did not differ from the male schizophrenic patients. It is suggested that platelet MAO activity may be related to hormonal, dietary, or genetic factors but not to psychiatric diagnosis. (23 ref)—*Journal abstract*.

9763. Frith, Uta & Frith, Christopher D. (MRC Developmental Psychology Unit, London, England) Specific motor disabilities in Down's Syndrome. *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Oct), Vol 15(4), 293-301.—Compared 17 children with Down's syndrome with 19 severely subnormal autistic children and with 23 normal children on 2 simple motor tasks (pursuit rotor tracking and finger tapping). It was hypothesized that Down's syndrome is associated with specific difficulties in using long-term motor programs and that mongoloid children may, therefore, be dependent on simple feedback processes to perform motor tasks. Results show that although the groups were matched on initial tracking performance, Down's syndrome children failed to show any improvement after a 5-min rest, while both comparison groups showed a very

marked improvement. On the finger tapping task, Down's syndrome children were abnormally slow compared to the other groups. Neither the level of mental development nor the degree of general mental retardation can account for these deficits. (26 ref)—*Journal summary*.

9764. Gabel, Peter. (U California, Ctr for the Study of Law & Society, Berkeley) Freud's death instinct and Sartre's fundamental project. *Psychoanalytic Review*, 1974(Sum), Vol 61(2), 217-227.—Discusses a correspondence between Freud's death instinct and Sartre's fundamental project. Although divergent assumptions of the 2 thinkers are recognized, Freud's death instinct is seen to make man's life a futile passion, with happiness as the satisfaction of instinct forever out of reach. For Sartre, Being-in-itself-for-itself is unattainable. Both concepts seek the inanimateness of a thing, understood as For-itself or instinct. Contradictions are considered in terms of differences in methodology.—B. Smith.

9765. Gediman, Helen K. (Albert Einstein Coll of Medicine, Yeshiva U) Narcissistic trauma, object loss, and the family romance. *Psychoanalytic Review*, 1974(Sum), Vol 61(2), 203-215.—Describes 2 cases of the family-romance fantasy, one of a man with a noticeable birth defect, the other of a woman adopted into an aristocratic family who suffered traumatic object losses. The fantasies served to restore self-esteem after disillusionment. The effect of the fantasy on transference and countertransference in the psychoanalytic training situation is discussed.—B. Smith.

9766. Glantrapani, Duilio. (Duke U, Medical Ctr, Asheville) Electroencephalographic findings in deaf psychotic patients. *Journal of Rehabilitation of the Deaf*, 1974(Apr), Vol 7(4), 14-21.—Studied the relationship between psychosis among deaf patients and EEG recordings. 26 Ss were selected from Chicago and the adjoining areas including the state hospitals. Criteria for inclusion were based on previous audiologic and psychiatric examinations. The most common EEG abnormality found in these records was excessive slow activity, proportionately distributed throughout the various deafness etiologies (unknown, rubella, hereditary, and other) except for scarlet fever which showed no EEG abnormality. The asymmetries noted occurred primarily in the temporal areas, while sharp wave activity was prevalent in the parietal areas. The 6 normal EEGs were observed among patients with a diagnosis of schizophrenia. Due to the small size of the sample, statistical tests were not carried out. It is concluded that there is a high percentage of organic involvement in patients with deaf psychotic symptomatology.—R. S. Albin.

9767. Goetzl, Ugo; Green, Ronald; Whybrow, Peter & Jackson, Rebecca. (Pennsylvania State U, Milton S. Hershey Medical Ctr) X linkage revisited: A further family study of manic-depressive illness. *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 665-672.—Conducted a family study of 39 individuals with proven manic-depressive disorder. Among the affected first-degree relatives of these probands, an overall parity of the male-female ratio was found. In addition, there were 4 instances of father-son transmission of affective illness involving probands of the sample. Results suggest that any gene locus that exists on the X chromosome is

not of itself a sufficient or necessary condition for the transmission of manic-depressive illness. Hence, any implication that X linkage is the primary mode of transmission in manic-depressive illness is premature. (27 ref)—*Journal abstract*.

9768. González, José L. & Quevedo, Gustavo. (Assn of Psychotherapy, Mexico City, MX) **Referential design of psychoses.** *Dynamische Psychiatrie*, 1973, Vol 6(6), 405-413.—Presents 3 theoretical models designed to conceptualize regressive phenomena and processes. They are based on Freud's theory of antithetic instincts, O. Rank's ideas on the trauma of birth, and M. Klein's school hypotheses on prenatal psychism and theories of "position." The psychotic reaction is understood as a regression which extends back into prenatal psychic life, a phase defined as fetal or manic position. 3 graphic illustrations show the importance of the fetal, depressive, and schizophrenic position for normal and pathological ego development. (German summary)—*T. Fisher*.

9769. Gunderson, John G. & Singer, Margaret T. (Harvard U, Medical School, Boston) **Defining borderline patients: An overview.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 1-10.—Reviews the literature, noting that accounts of borderline patients vary depending upon who is describing them and in what context, how the samples are selected, and what data are collected. 6 features are identified that provide a rational means for diagnosing borderline patients during an initial interview: the presence of intense affect, usually depressive or hostile; a history of impulsive behavior; a certain social adaptiveness; brief psychotic experiences; loose thinking in unstructured situations; and relationships that vacillate between transient superficiality and intense dependency. Reliable identification of these patients will permit better treatment planning and clinical research. (87 ref)—*Journal abstract*.

9770. Hartmann, Wolfgang & Pauls, Edlef. (U Göttingen, Psychiatrische Klinik, W Germany) **[A comparison between long term hospitalized and discharged schizophrenic patients regarding conditions on admission.]** (Germ) *Psychiatria Clinica*, 1974, Vol 7(1), 5-15.—Compared the case records of discharged and long-term hospitalized schizophrenic patients. It was found that the latter tended to be older, had been ill longer, had been isolated more often, were disadvantaged socially, and had been admitted to hospital compulsorily; they had been more frequently diagnosed as defect schizophrenics and less rarely had adequate physical treatment. It is concluded that long-term hospitalization is the final outcome of a long, drawn-out process which is decisively influenced by social factors. (26 ref)—*English abstract*.

9771. Häfner, H. & Böker, W. (U Heidelberg, Sozialpsychiatrische Klinik, W Germany) **[Mentally deranged persons committing acts of violence in the German Federal Republic: An epidemiological investigation.]** (Germ) *Nervenarzt*, 1972(Jun), Vol 43(6), 285-291.

9772. Horowitz, Mardil. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Stress response syndromes: Character style and dynamic psychotherapy.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 768-781.—Suggests that one way to organize clinical knowledge of psychopathology is to circumscribe a

limited area and describe within it the interactions between personality dispositions, states of disorder, and treatment techniques. This report models such an approach by limiting disorder to stress response syndromes, personality to obsessional and hysterical neurotic styles, and treatment to focal dynamic psychotherapy. Within this domain, an information processing approach to working through conflicted ideas and feeling is developed. The result is a series of assertions about observable behavior and nuances of technique. Since these assertions are localized conceptually, they can be checked, revised, refuted, compared, or extended into other disorders, dispositions, and treatments. (45 ref)—*Journal abstract*.

9773. Howard, James S. (Eastern State Hosp, Williamsburg, VA) **The anatomy of madness: Psychosis as functional hippocampal afterdischarge.** *Pavlovian Journal of Biological Science*, 1974(Oct-Dec), Vol 9(4), 208-214.—Presents a theoretical view of psychosis as hippocampal seizure and afterdischarge resulting from conditions of stressful stimulation and/or inhibitory disinhibition. Key anatomical structures involved and their dynamic interrelationships in health and psychosis are discussed. Several pathological physical conditions and certain types of autostimulatory behavior are seen as contributing to this condition or perpetuating it.—*Journal abstract*.

9774. Jacob, Theodore. (U Pittsburgh) **Family interaction in disturbed and normal families: A methodological and substantive review.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 33-65.—Evaluated 57 direct observation studies comparing family interaction in disturbed (schizophrenic and nonschizophrenic) and normal families. Major sections of the review include (a) a critical evaluation of the methodological adequacy of reviewed studies in terms of various design standards and controls; (b) an extensive review of substantive findings relevant to the content domains of dominance, conflict, affect, and communication clarity; and (c) a discussion of difficulties involved in comparison of results because of cross-study differences in diagnostic status of experimental groups, measurement techniques, type of analyses, and demographic factors. It was found that both social class status and age of child were significantly associated with various measures of conflict and dominance, and in many cases, obtained relationships were influenced considerably as a function of a Social Class  $\times$  Child's Age interaction. (110 ref)—*Journal abstract*.

9775. Jha, B. K. (Hosp for Mental Diseases, Ranchi, India) **Institutional neurosis: Its causes and remedy.** *Indian Journal of Psychiatric Social Work*, 1972(Jul), Vol 1(1), 5-19.—Describes the clinical features of institutional neurosis and its diagnosis, etiology, treatment, and prevention in a mental hospital. Characterized by apathy, lack of initiative, loss of interest in things and events, submissiveness, and deterioration of personal habits and standards, the disease develops and exists independently of the syndrome for which the patient was hospitalized. It is caused by lack of contact with relatives, friends and the outside world, enforced idleness, and a depressing atmosphere. Treatment and prevention consist of improving hospital conditions and

policies to allow for outside contact, in-hospital rehabilitative employment, maintenance of family relationships, and a cheerful, attractive environment. It is suggested that an aftercare program for dismissed patients should be provided. (23 ref)—*A. de la Haba.*

9776. Jordan, J. M. & Whitlock, F. A. (U Queensland, Brisbane, Australia) **Atopic dermatitis anxiety and conditioned scratch responses.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 297-299.—Tested the hypothesis that patients suffering from atopic dermatitis form a conditioned scratch response more rapidly than a matched control group, the main concern being anxiety level. 6 male and 12 female patients with a diagnosis of atopic dermatitis and a matched control group were presented an itch stimulus paired with a neutral stimulus (a tone). Previous differences in number of trials required to condition a scratch response to the tone disappeared when the groups were matched on the Welsh Anxiety Scale.—*W. G. Shipman.*

9777. Kaplan, Linda J. (Private practice, New York, NY) **The concept of the family romance.** *Psychoanalytic Review*, 1974(Sum), Vol 61(2), 169-202.—Discusses the family-romance fantasy, the fantasy of being the child of other parents usually of higher standing, as manifested developmentally and sublimated in everyday life. Precipitated by inevitable disillusionment with real parents, the family-romance fantasy is an attempt to regulate self-esteem. In the pre-oedipal phase, the child feels that his affection for his parents is not fully reciprocated; during the oedipal phase, the threat of retaliation for incestuous wishes is relieved through fantasized substitute parents; during latency and adolescence, rescue fantasies develop. Pathological manifestations are related to etiology, symptomatology, affectual correlates, and defensive character structure. Special forms of the family-romance fantasy in the artist and imposter are discussed. (53 ref)—*B. Smith.*

9778. Koh, Soon D.; Kayton, Lawrence & Schwarz, Carolyn. (Michael Reese Hosp, Psychosomatic & Psychiatric Inst, Chicago, IL) **The structure of word storage in the permanent memory of nonpsychotic schizophrenics.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 879-887.—Conducted 2 experiments to assess the storage structure of common English words in the memory of young nonpsychotic schizophrenics. 37 schizophrenic and 12 nonschizophrenic psychiatric patients and 36 normals were Ss in the 2 experiments. Ss in both experiments sorted words on the basis of the similarity of relatedness they perceived, but Ss in Exp II performed this task under time pressure. Assuming that the structure underlying these sortings reflects the storage structure of memory, a method of cluster analysis was applied to the data. The structural features extracted for all Ss were very similar to each other. A group difference was found in the S's sorting strategy, but its effect on the main findings was minimal. It is concluded that the storage structure of words in the memory of schizophrenics is probably intact. (19 ref)—*Journal abstract.*

9779. Kurtz, Helen & Davidson, Samai. (Kupat Cholim Mental Health Clinic, Haifa, Israel) **Psychic trauma in an Israeli child: Relationship to environmental security.** *American Journal of Psychotherapy*,

1974(Jul), Vol 28(3), 438-444.—Describes the etiology, dynamics, and therapy of a case of somnambulism in an 11-yr-old child who underwent a trauma following the injury of his father in an Israeli security operation. Implications of this case for the theory of the "constructive trauma" are discussed.

9780. Larson, C. A. & Nyman, G. E. (U Lund, Inst of Genetics, Sweden) **Schizophrenia: Outcome in a birth year cohort.** *Psychiatry Clinica*, 1974, Vol 7(1), 50-55.—Studied a birth year cohort of 153 schizophrenic men for the original purpose of securing the unbiased age of onset of the disease. Secondly, data on 748 full siblings of the Ss were collected. Ss were from southern Sweden, had been hospitalized for schizophrenia, and were born between 1881 and 1900. All available hospital records of siblings, parents, and Ss were examined to assess type, course, and outcome of disease. Findings indicate that poor prognosis was significantly more common in men with early onset of schizophrenic symptoms than in men with late manifestations. 90 Ss not observed to be demented had a mean age of onset of schizophrenia of 38.7  $\pm$  12.9 yrs, while 63 Ss who became demented had a mean age of onset of 31.2  $\pm$  10.8 yrs. Homotypy for outcome was not observed within schizophrenic families. Results indicate that Ss experienced poor or favorable outcome independently of presence or absence of regressive schizophrenia in siblings or parents.—*Journal abstract.*

9781. Lehrman, Samuel R. (Private practice, Hewlett, NY) **Varieties of depression in one patient.** *Psychiatric Quarterly*, 1974, Vol 48(2), 283-294.—Presents the case history of a 28-yr-old woman who, during 25 yrs, presented various types of depression. It is theorized that all depressions are overdetermined psychosomatic diseases with both psychic and organic causes, and that different varieties of depression necessitating different therapeutic approaches may occur in a single patient under different conditions.—*Journal abstract.*

9782. Lesse, Stanley. **Depression masked by acting-out behavior patterns.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 352-361.—Discusses masked depression which may be revealed by probing behind psychosomatic disorders, hypochondriacal syndromes, or various other behavior problems. In this type of pattern, the psychosomatic or hypochondriacal symptoms or behavioral disturbances are masking an active depression with the depressive core being just beneath the surface. In addition, patients with these symptoms relatively early in life are most likely to develop depressions, particularly from age 40 on. Acting-out patterns masking depression in infants, children, adolescents, and adults are discussed. Patients with masked depression are almost without exception extremely angry persons. The treatment of these problems is briefly discussed. (18 ref)—*R. S. Albin.*

9783. Letourneau, Jacques E. (U Montréal, Ecole d'Optométrie, Québec, Canada) **The Oppel-Kundt and the Müller-Lyer illusions among schizophrenics.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 775-778.—Compared errors of 5 paranoid schizophrenics (age range, 40-57 yrs) and 5 simple schizophrenics (age range, 31-60 yrs) on Oppel-Kundt and Müller-Lyer illusions. Significant differences between groups were found on

the Oppel-Kundt but not on the Müller-Lyer. Results are discussed in terms of Piaget's theory and defensiveness. —*Journal abstract.*

9784. Markson, Elizabeth W. (Massachusetts Dept of Mental Health, Boston) **A touch of class? A case study of geriatric screening process.** *International Journal of Aging & Human Development*, 1974(Spr), Vol 5(2), 187-196.—Examined 174 diagnoses and geriatric screening decisions for mental disorders made at a New York State institution over a 7-mo period. The geriatric screening team established criteria for admission which defined hospitalization as appropriate for treatment of acute episodes of mental illness or emotional disturbance, for exacerbations of psychiatric illness unrelated to the normal course of aging, and for temporary relief of a social problem within the family. Patients were banned from admission whose prime reason for referral was physical illness, senility with no psychiatric illness other than that associated with the aging process, and for social reasons, such as a lack of housing. Analysis of decisions indicates rejection of a higher proportion of patients with functional illness and of a lesser proportion of those with organic illness. More old people of the same ethnic origin and sex as the screening examiner were designated as suitable for inpatient care than applicants of a different sex and ethnic origin. Implications of these findings for the control of persons needing mental health care are discussed. (16 ref)—*A. J. Traxler.*

9785. Masciangelo, Pier. ["Ethical perversion": A view of the masochistic complex.] (Ital) *Rivista di Psicoanalisi*, 1973(Jan-Apr), No 19, 65-84.—Explains the origins of masochistic attitudes—ethical perversion—by which the individual finds satisfaction in depriving himself of pleasure. (23 ref)

9786. McLaughlin, Thomas J.; Solomon, Leonard & Harrison, Robert. (VA Hosp, Psychophysiology Lab, Bedford, MA) **The use of feedback electroencephalography to assess levels of attention and motivated interests in paranoid and nonparanoid schizophrenics.** *Journal of Nervous & Mental Disease*, 1974(Dec), Vol 159(6), 422-432.—Presents a report of a preliminary evaluation of the method of feedback EEG to assess levels of attention and motivated interests in schizophrenics. The alpha-blocking component of the orienting response was the main dependent variable used to define interest and motivation. Presentation of the pictorial stimuli was regulated by the presence of alpha in the EEG (negative feedback). 2 hypotheses of the motivational conflicts responsible for the paranoid's illness are examined—the traditional Freudian explanation of repressed homosexuality, and the psychosocial view of an unstable sense of autonomy and need for power and control. Data from 24 paranoid and nonparanoid 18-45 yr old schizophrenics indicate that poor premorbid nonparanoids engaged in less spontaneous attentiveness than good premorbid paranoids. This finding supports Freud's thesis that the regressed nonparanoid has withdrawn his interest from the environment. Data do not confirm the vigilance hypothesis of paranoid schizophrenia, although a trend for poor premorbid to be more attentive than good premorbid suggests the need for more study of attentional differences. Results also do not support hypotheses of the specific motiva-

tional conflicts responsible for the paranoid's illness. (32 ref)—*Journal abstract.*

9787. Micklem, Niel. **On hysteria: The mythical syndrome.** *Spring*, 1974, 147-165.—Discusses various aspects of hysteria as it has been regarded throughout the centuries from the earliest mythology when Dionysus was thought to be the archetype of hysteria, through the feasts called "the Hysteria" honoring the mother-Goddess to present times. It was believed for a long time to be exclusively a feminine illness, but later it was discovered that men also suffer from this syndrome. Physicians have differed on its definition, and in 1952 eliminated it from the American classification of illness, substituting "conversion symptom." Some reasons for re-examining the concept "hysteria" are suggested.—*A. de La Haba.*

9788. Morrison, James K. (Capital District Psychiatric Ctr, Cohoes, NY) **Labeling: A study of an "autistic" child.** *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 71-80.—Describes the case of a 10-yr-old autistic boy to demonstrate the drastic effects of "psychiatric labeling" on the social status of and behavior toward a child, which inevitably results in negative behavioral changes. It is suggested that the use of such labels (i.e., "autistic") by the parents to significant others in the child's environment influences these persons to view the child in a similar framework of ignorance. How dramatic behavioral changes were induced in the child after introducing his parents and significant others to the principles of cognitive learning theory is outlined. (Spanish & French abstracts)—*Journal abstract.*

9789. Munroe, Robert L. & Munroe, Ruth H. (Pitzer Coll) **Psychological interpretation of male initiation rites: The case of male pregnancy symptoms.** *Ethos*, 1973(Win), Vol 1(4), 490-498.—Studied the incidence of sympathetic pregnancy symptoms among males in societies with and without initiation rites. It is suggested that the absence of male initiation rites in cultures in which primary infantile identification is with the female role can have serious psychological consequences for the individual. (2 p ref)

9790. Mura, Elaine L. (Pahlavi U, Shiraz, Iran) **Perinatal differences: A comparison of child psychiatric patients and their siblings.** *Psychiatric Quarterly*, 1974, Vol 48(2), 239-255.—Results of a comparison study of 74 child psychiatric inpatients and their own nonpsychiatrically disturbed siblings ( $n = 74$ ), shows that the mothers had experienced more pregnancy and delivery complications with the patients than with the siblings. Analyses of groups by sex suggest that most of these differences were contributed by the male patients rather than by the female patients. No perinatal differences among the patients were found when patients were divided by diagnoses. (25 ref)—*Journal abstract.*

9791. Murphy, Dennis L. & Beigel, Allen. (NIMH, Bethesda, MD) **Depression, elation, and lithium carbonate responses in manic patient subgroups.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 643-648.—Depressive elements were observed on a quantitative behavioral rating scale (the Manic-State Rating Scale) during manic episodes in 28 of 30 patients, suggesting that most manic patients manifest a "mixed" manic-depressive picture. A factor analysis of the scale

confirmed a "core" group of manic symptoms as well as a dichotomous grouping of elated-grandiose (E-G) and paranoid-destructive (P-D) patients. It also suggested a close relationship between the presence of rated depression during mania and the particular symptomatic complex found in the P-D subgroup of manic patients. Elation ratings were significantly correlated with total mania scale ratings only in the E-G patients. These differences had apparent relationships to therapeutic responses to lithium carbonate; manic patients in the E-G subgroup responded more frequently than did patients in the P-D subgroup. (22 ref)—*Journal abstract*.

9792. Murphy, Dennis L.; Donnelly, Cynthia & Moskowitz, Jay. (NIMH, Section of Clinical Neuropharmacology, Bethesda, MD) **Catecholamine receptor function in depressed patients.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1389-1391.—Compared the effects of norepinephrine on catecholamine alpha receptors in platelets obtained from 17 bipolar and unipolar depressed patients and from 11 normal Ss. No differences were found, although reduced catecholamine receptor function has been suggested as one specific mechanism to account for a deficit in catecholamine function in depression. (26 ref)—*Journal abstract*.

9793. Müller, E. (U Vienna, Psychological Inst, Div of Experimental & Applied Psychology, Austria) **[On the objectivization of the symptom "impaired facial recognition": An experimental-psychological study of psychiatric-neurological groups of patients.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 2(2), 126-144.—Investigated impairment of facial recognition in 60 right-handed Ss 16-60 yrs old, none affected by any kind of drugs. Ss were tested in 4 groups: 15 with paraphrenic and 15 with predelirant syndromes, 15 with lesions in the right hemisphere and 15 normal controls. Ss were shown 102 photographs and asked to match a given photograph to 1 out of a group of 16. Each S with a lesion in the nondominant right hemisphere was also tested for self-recognition by being shown his own photograph in the test series. In "Identi-Kit" tests, Ss were required to construct a phantom likeness of themselves and of a person well known to them—usually one of the participating physicians. Several other tests were also administered. Results indicate the following: (a) Ss with paraphrenic and predelirant syndromes performed significantly worse than normal controls in tasks of facial recognition. (b) Performance of Ss with lesions in the right hemisphere was as poor as that of the psychotics. (c) Ss with brain lesions and healthy controls were able to construct phantom pictures of their own faces, while Ss in the 2 psychotic groups were not. Findings suggest that agnosia for faces in psychotics cannot be ascribed to memory disorders but is caused by a perceptual deficiency. (English summary)—*T. Fisher*.

9794. Müller, Ilse. (Fachkrankenhaus für Neurologie und Psychiatrie, Berlin, E Germany) **[False evaluation of the personality with questionnaire investigations.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Apr), Vol 26(4), 223-230.—Reports that neurotic patients show a tendency for their overt behavior to contradict their positive opinions of themselves as revealed by medical questionnaires.

9795. Müller, Karl. **[Remarks on the so-called pure defect.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Apr), Vol 26(4), 202-210.—Discusses G. Huber's attempted differentiation of schizophrenic defects in his search for a "pure defect" which is to represent the essence of all genuine schizophrenic defective syndromes.

9796. Naditch, Murray P.; Gargan, Margaret A. & Michael, Laurie B. (Cornell U) **Denial, anxiety, locus of control, and discrepancy between aspirations and achievements as components of depression.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 1-9.—Reformulated a number of clinical observations about depression to test them empirically, using multiple regression equations. Ss were 547 men in Army basic training. Psychological measures included the Depression subscale of the Cornell Medical Index, Rotter's Internal-External Control Scale, the Institute for Personality and Ability Testing Anxiety Scale, N. Hahn's denial measure, and the Cantril Self-Anchoring Striving Scale. Depression was negatively correlated with denial and positively correlated with anxiety, locus of control, and the discrepancy between aspirations and achievements (discontent). Locus of control was positively correlated with discontent and anxiety and negatively correlated with denial. There were interaction effects between locus of control and discontent, between locus of control and anxiety, and between anxiety and denial when these terms were regressed on depression. (34 ref)—*Journal abstract*.

9797. Nastović, Ivan. (Neuropsychiatric Clinic, Belgrade, Yugoslavia) **[Psychodynamic aspects of neurotic depersonalization.]** (Serb) *Anali Zavoda za Mentalnu Zdravlje*, 1972, Vol 4(3), 75-83.

9798. Newmark, Charles S.; Newmark, Linda & Faschingbauer, Thomas R. (U North Carolina, Medical School, Chapel Hill) **Utility of three abbreviated MMPIs with psychiatric outpatients.** *Journal of Nervous & Mental Disease*, 1974(Dec), Vol 159(6), 438-443.—Presents evidence substantiating the need for an abbreviated form of the MMPI and reports a study of the comparative utility of 3 recently developed abbreviated MMPIs with data from the records of 65 male and 65 female 17-58 yr old psychiatric outpatients. The similarity of the group profiles within each sex as well as the highly significant scale correlations suggest that each of the 3 abbreviated MMPIs corresponds fairly accurately to the standard form for these Ss as a group. However, investigations of the profile pairs for individual Ss consistently found that T. R. Faschingbauer's abbreviated MMPI permitted the most accurate conclusions concerning the validity, high points, and general elevation of the corresponding standard MMPI. Numerous deficiencies were evident when using either the Mid-Mult or J. A. Hugo's abbreviated MMPI, especially with regard to classification analysis concerning validity.—*Journal abstract*.

9799. Niskanen, Pekka & Rath, Fredrich. (Helsingin Yliopistollinen Keskussairaala, Psykiatrian Klinika, Lapinlahdentie, Helsinki, Finland) **[Changes in the forms of depressive psychoses: Investigation of 90 years of cases (1880-1971) at the psychiatric clinic of the University of Helsinki.]** (Germ) *Psychiatrie, Neurologie*

und medizinische Psychologie, 1974(Jun), Vol 26(6), 332-343.—Analysis of medical records shows that the specific primary criteria of diagnosis of depressive psychosis changed only slightly from 1880 to 1971, but the secondary criteria have changed considerably. Average duration of hospitalized treatment has been reduced from 142 to 52 days. Religious hallucinations and feelings of guilt usually accompanied depressive psychosis until about 1930. However, suicidal tendencies and attempted suicides have doubled since 1900. Further relations between Zeitgeist and psychic ills are noted.—K. J. Hartman.

9800. Öhman, Arne; Erixon, Gösta & Löfberg, Ingrid. (Uppsala, Sweden) **Phobias and preparedness: Phobic versus neutral pictures as conditioned stimuli for human autonomic responses.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 41-45.—Exposed 64 undergraduates to pictures of phobic (snakes) and supposedly neutral (human faces or houses) objects as conditioned stimuli (CSs) in a classical conditioning experiment with shock as the unconditioned stimulus (UCS) and skin conductance responses as the dependent variable. One group was shocked on the phobic and another on one of the neutral sets of pictures. During 10 acquisition trials both groups showed equal conditioning on CS and pre-UCS responses. During extinction, however, there were lasting conditioning effects in CS and, to a lesser extent, post-UCS responses to phobic but not to neutral stimuli. Instructions that no more shocks would be given seemed ineffective in modifying CS, but not post-UCS, responses. It is concluded that the present experimental situation may serve as an experimental analog of phobias.—*Journal abstract.*

9801. Odegard, Ornulf. **Season of birth in the general population and in patients with mental disorders in Norway.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 397-405.—Compared the monthly distribution of births in 62,190 psychiatric hospital patients with the corresponding pattern in the general population of Norway. The number of births per day varied in a sinusoidal curve between a maximum in January-May and a minimum in October-December. There was an additional, more sharply defined peak in September which was interpreted as corresponding to a maximum of conceptions during traditional midwinter festivals. Data from a controlled comparison of the years of birth are presented which show that schizophrenic patients had significantly higher monthly birth fluctuations than either the general population or other psychiatric diagnostic groups. The September maximum, however, was the same in all patient groups and in the general population. Findings are consistent with the existence of complex sociobiological differences between schizophrenics and the general population which are dependent on seasonal variations. Subclinical brain damage is suggested as the most likely pathological mechanism.—*Journal summary.*

9802. Pasricha, S. **Pattern of personality in normals, anxiety neurotics and schizophrenics on Guilford's STDCR.** *Indian Journal of Clinical Psychology*, 1974(Mar), Vol 1(1), 29-33.—Administered the Yatabe-Guilford Personality Inventory to 30 anxiety neurotics, 30 schizophrenics, and 30 controls to investigate patterns of personality traits among groups. The inventory is a

modification of Guilford's An Inventory of Factors STDCR, consisting of 120 items measuring 12 factors. Ss were males, matched for age and education levels. Results indicate that factors S, T, D, C, R, I, N, O, Ag, and Co significantly differentiate between neurotics and controls; factors D, C, A, I, N, O, Ag, and Co differentiate between schizophrenics and controls; and factors C, G, A, and N significantly differentiate between neurotics and schizophrenics. The resulting patterns are considered useful in differential diagnosis.—F. S. Beyer.

9803. Pershad, D.; Kaushal, P. & Verma, S. K. (Postgraduate Inst of Medical Education & Research, Chandigarh, India) **Neuroticism scores of mothers of mentally retarded and of neurotic children.** *Indian Journal of Mental Retardation*, 1973(Jan), Vol 6(1), 24-27.—Administered a 38-item Hindi Health Questionnaire to the mothers of 25 mentally retarded children and of 21 emotionally disturbed children attending a child guidance clinic. The mothers of mentally retarded children were found to be more emotionally disturbed—i.e., more neurotic—than the mothers of emotionally disturbed children ( $p < .05$ ).

9804. Pethő, Bertalan. (Oberarzt und Leiter des Psychopathologischen Lab, Budapest, Hungary) [Some significant aspects of the nosology of the schizophrenia question: Contributions I, II, and III.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jun), Vol 26(6), 321-331.—Discusses contrasting historical developments in the classification of schizophrenia. The prevailing psychogenetic interpretation has enlarged symptomatology until schizophrenia can be found everywhere. A minority opinion is that a clear-cut and unmistakable definition of the disease is possible.

9805. Pethő, Bertalan. (Psychopathologischen Lab, Budapest, Hungary) [Significant nosological aspects of the schizophrenia problem: Report on the development and role of psychiatric diagnoses oriented toward brain pathology.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Apr), Vol 26(4), 211-216.—Traces development of classificatory systems related to brain pathology and schizophrenia. Contributions of C. Wernicke, K. Leonhard, and others are reviewed. Search for an ideal system of ordering symptomatology in schizophrenia has been actively pursued in German psychiatry for 70 yrs.—K. J. Hartman.

9806. Platt, Jerome J. et al. (Hahnemann Medical Coll & Hosp, Philadelphia, PA) **Adolescent problem-solving thinking.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 787-793.—Tested the hypothesis that adolescent psychiatric patients would be deficient with respect to normal controls in their interpersonal problem-solving skills by comparing 33 patients and 53 high school student controls on 7 tasks reflecting different aspects of problem solving. With IQ covaried out, controls obtained significantly higher scores on the tasks evaluating optional thinking, social means-ends thinking, and role taking, but not on the tasks measuring problem recognition, causal thinking, emotional means-ends thinking, and consequential thinking. Findings are interpreted within a developmental framework of interpersonal problem-solving thinking. (27 ref)—*Journal abstract.*

9807. **Resta, Giorgio.** (U Genoa, Medical School, Inst of Psychology, Italy) [The problem of classifying the interactions which condition human development.] (Ital) *Medicina Psicosomatica*, 1972(Oct), Vol 17(4), 353-366.—Emphasizes the importance of various interactions during early developmental stages. Interactions are both pre- and postnatal, organic and inorganic. It is suggested that psychosomatic phenomena may originate in such interactions. (English & French summaries)

9808. **Rutter, Michael et al.** (Inst of Psychiatry, London, England) **Children of West Indian immigrants: I. Rates of behavioural deviance and of psychiatric disorder.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Oct), Vol 15(4), 241-262.—Conducted a survey of all 10-yr-old children in an inner London borough. Teachers' questionnaires were completed on all children, and teachers and parents of a representative subsample of 383 children were interviewed using standardized and previously tested methods. Comparisons were also made between children born to West Indian migrants and children from nonimmigrant families, and within the West Indian group between children born abroad and those born in the country. It was found that West Indian children showed more behavioral difficulties at school, but they did not differ from other children in terms of disorder shown at home, nor did they differ in terms of emotional disturbance in any setting. (30 ref)—*Journal summary.*

9809. **Sargent, Douglas A.** (Grosse Pointe Farms, MI) **Confinement and ego regression: Some consequences of enforced passivity.** *International Journal of Psychiatry in Medicine*, 1974(Spring), Vol 5(2), 143-151.—Notes that imprisonment and enforced passivity cause ego regression which may persist even after release from confinement. Steps are suggested to diminish the apparent antagonism between confinement and rehabilitation. Clinical examples are drawn from cases seen in the federal prisons, juvenile courts, and hospitals.—*Journal summary.*

9810. **Schless, Arthur P.; Schwartz, L.; Goetz, Christopher & Mendels, J.** (U Pennsylvania) **How depressives view the significance of life events.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 406-410.—Administered the Social Readjustment Rating Scale (SRRS) by T. H. Holmes and R. H. Rahe and the Beck Depression Inventory to 76 patients consecutively admitted to a hospital with diagnoses of depression. All Ss were tested on admission and again at discharge. Neurotic depressed patients viewed life events as uniformly more stressful than a comparison group of nondepressed Ss. The weights assigned to the 43 individual life events in the SRRS were independent of the patient's age, sex, severity of depression, whether S had actually experienced the event, and symptomatic improvement.—*Journal summary.*

9811. **Sen, N. N.** (National Inst of Education, New Delhi, India) **Behavior therapy in depressions: I. Experimental analysis.** *Indian Journal of Clinical Psychology*, 1974(Mar), Vol 1(1), 53-58.—Discusses the experimental analysis of depression in terms of classical conditioning, operant conditioning, and learning theory models. Relevant experimental findings of each model and resulting views of clinical depression are presented,

emphasizing their significance for the behavior therapist. It is suggested that although these approaches do not provide a comprehensive theory of depression, since many issues are neglected, they do provide a useful framework for the analysis and treatment of depressive behavior. (15 ref)—*F. S. Beyer.*

9812. **Serban, George.** **The process of neurotic thinking.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 418-429.—Discusses neurotic conflict on a cognitive level as resulting from a selective faulty system of reasoning based on magical convictions and beliefs. The neurotic modifies his thinking based on inferential assumptions. The roots of this problem are traced back to childhood when judgment is magical and self-centered. Several case examples are presented. The content of consciousness in the general state of anxiety neurosis is also discussed. In this state, the neurotic feels the constant threat of some impending, perhaps fatal catastrophe. Unable to assess the gap between existing realities and wishful possibilities, he mistakes the physical dysfunctions produced by his anxiety for the cause of his suffering. The therapeutic approach is based on the correction of the thinking process by a reformulation and reorganization of it according to adult reality.—*R. S. Albin.*

9813. **Sermet, O.** (Welsh National School of Medicine, Cardiff) **Emotional and medical factors in child dental anxiety.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Oct), Vol 15(4), 313-321.—Studied 100 dentally anxious and 100 dentally nonanxious 5-12 yr old children to examine the etiology of child dental anxiety, particularly the role of emotional and medical factors in this respect. Information was obtained about Ss through a semistructured interview with the mother and by her completion of Rutter's Child Scale A Questionnaire. Results show significant differences between the 2 groups of children in their emotional disorders and their medical experiences. Since the scale provided information only on the child's behavior as seen by the parent and since it has been shown that a child's behavior at home and at school differ strikingly, it is suggested that it would also have been valuable to have the teacher's independent ratings.—*Journal summary.*

9814. **Shapiro, Theodore.** (New York U. Medical School) **Language development in young schizophrenic children: Direct observation as a constraint on constructions in analysis.** *Psychoanalysis & Contemporary Science*, 1973, Vol 2, 175-187.—Compared the speech of 8 schizophrenic children ranging in age from 2 to 7 yrs with the speech of control groups of normally developing 4, 3, and 2 yr olds. 2 dimensions of speech, morphology (e.g., babbling, jargon, words, phrases) and function (communicative or noncommunicative), were analyzed. It was found that the schizophrenic Ss produced as many utterances as normal Ss, but that each utterance was shorter, and that a sizeable proportion of the schizophrenic Ss' speech was out of context. Schizophrenic Ss produced rigidly congruent imitative speech, while control Ss produced structurally creative imitations. It is concluded that the rigidity and nonadaptiveness of the schizophrenic child's speech are behavioral reflections of a rigid, poorly integrated ego. It is suggested that

therapeutic interpretations should be given to schizophrenic children only in short, simple, and repetitive phonetic and syntactic forms. (1 p ref)—*J. Kelly.*

9815. **Sharma, R. G.** (Hosp for Mental Diseases, Ranchi, India) **Psycho-sexual hazards of I.U.C.D. insertion.** *Indian Journal of Psychiatric Social Work*, 1972(Jul), Vol 1(1), 36-41.—Investigated the psychosexual complications following intrauterine contraceptive loop insertion in 72 women. Psychosomatic symptoms including abdominal pain, nausea, vomiting, and backache were observed as well as mild psychological symptoms. A decrease in sexual desire occurred in 36% of Ss.

9816. **Smythies, J. R.** **The biochemical basis of schizophrenia.** *Jornal Brasileiro de Psiquiatria*, 1972(Jan), Vol 21(1), 5-8.—Proposes that "real" schizophrenia must have some genetic biochemical abnormality or, more probably, a collection of different inborn errors of metabolism, since "schizophrenia" is probably a group of diseases with different etiologies. 2 "established facts" are discussed: (a) the acutely psychotic reaction, experienced by 40% of chronic schizophrenics, to 20 g/day levomethionine—involving a transmethylation effect of levomethionine on dimethyltryptamine; and (b) the antipsychotic action of the phenothiazines and pimozide suggesting overactivity of adrenergic or dopamine systems in schizophrenia.—*D. J. Clair.*

9817. **Sollini, Adriano.** **[A clinical contribution to the study of the role of the scopophilic impulse in the psychopathology of the sense of identity.]** (Ital) *Rivista di Psicoanalisi*, 1973(Jan-Apr), No 19, 43-64.—Notes that the frustration of oral needs, responsible for the disturbance in early object relations, constitutes a hindrance to the development of the identification process and to reality orientation. In defensive reaction to oral anxiety, the relationship with the object develops by using the psychosensory visual area. The use of pathological identifications and/or of regressive imitations produces a false identity with unbalanced perception of environmental elements. This dynamic magnifies the visual value in the internalization process. (19 ref)—*D. Araoz.*

9818. **Spitzer, Robert L. & Fleiss, Joseph L.** (New York State Dept of Mental Hygiene at the Psychiatric Inst, Biometrics Research, New York) **A re-analysis of the reliability of psychiatric diagnosis.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 341-347.—Discusses some of the difficulties in evaluating diagnostic reliability, presents a reanalysis of available data from the literature, and suggests possible actions that can be taken to increase the accuracy of psychiatric diagnosis. Methods of calculating the degree of interjudge agreement are described, and the validity of the resulting statistic, kappa, an intraclass correlation coefficient which contrasts the observed proportion of agreement with the proportion expected by chance, is discussed. The calculation of kappa, chance corrected agreement, is performed for 6 major studies of diagnostic reliability. Data suggest that there are no diagnostic categories for which reliability is uniformly high; reliability appears to be satisfactory only for 3 categories—mental deficiency, organic brain syndrome (not its subtypes), and alcoholism. 2 new procedures which may improve the reliability of diagnosis, structured interview schedules and specifi-

cations of all diagnostic criteria, are described. (28 ref)—*L. Gorsey.*

9819. **Sternberg, E.** (USSR Academy of Medical Sciences, Inst of Psychiatry, Moscow) **[On the present state of research into schizophrenia and some of its current tasks.]** (Germ) *Fortschritte der Neurologie, Psychiatrie und ihrer Grenzgebiete*, 1973(Mar), Vol 41(3), 123-140.—Surveys and discusses recent developments and trends in the field of schizophrenia research, particularly those which are of interest and importance for the research projects of the Psychiatric Institute of the Soviet Academy of Medical Sciences in Moscow. (1 p ref)—*T. Fisher.*

9820. **Stettner, John W.** (McCormick Theological Seminary, Chicago, IL) **What to do with visions.** *Journal of Religion & Health*, 1974(Oct), Vol 13(4), 229-238.—Discusses reports about visions (psychoses?) that A. Boisen and Jung experienced and compares them to Biblical records of similar experiences. It is suggested that hallucinatory ideas arise primarily from the unconscious and that they be integrated into other life experiences.

9821. **Symonds, Martin.** (American Inst for Psychoanalysis, New York, NY) **Therapeutic approaches to acting out.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 362-368.—Presents a theoretical framework for acting-out behavior that specifies the history of the usage of the term, the psychoanalytic view of such behavior, and current sociological usage. Both the dynamics and therapeutic approaches to adolescents whose acting out is characterized as delinquent and antisocial are discussed. Individuals who act out are viewed as totally absorbed in their own needs; to them the behavior appears totally unrelated to other individuals or to feelings toward them. Illustrative case examples are cited. Profoundly defective parenting seems to be a significant factor in the development of the acting-out youngster. In a climate of hopelessness and despair, a youngster begins to live only in the immediate present with no thought of the future. He becomes egocentric and unrelated to other individuals and their needs. It is stressed that the therapist needs to be firm and to make his attitudes, values, and particularly his boundaries known to the youngster.—*R. S. Albin.*

9822. **Thuwe, Inga.** (U Göteborg, Psychiatric Research Ctr, St Jörgen's Hosp, Sweden) **Genetic factors in puerperal psychosis.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 378-385.—Reports data obtained for the period from 1872-1926 which show that a record of mental illness or psychiatric treatment was significantly more common among children of women who had been treated for puerperal psychosis than among controls selected from the population register in Sweden. The same tendency was also evident in the grandchild generation, but the differences did not reach statistical significance. Social-class, suicide-rate, and cause-of-death data are also presented. Findings support the existence of genetic factors in the general category of puerperal psychoses. No particular pattern of major genes could be identified; however, the fairly high risk of mental illness in the 1st filial generation suggests that dominant transmission plays some part in the operation of the genetic factors.—*L. Gorsey.*

9823. Todd, N. A. (Leverndale Hosp, Glasgow, Scotland) **Patterns of admission in schizophrenia.** *British Journal of Psychiatry*, 1974(Dec), Vol 125, 588-592.—Presents data on long-term male patients admitted, readmitted, or recruited to a 1,036-bed psychiatric hospital during 1967-1970. Results show that 83% of the male schizophrenics were readmissions suffering from relapses or continuing illnesses. Follow-up of the first admissions indicated that there were approximately equal numbers of patients in 3 clinical categories (social recovery, mild or moderate disability, and moderate or severe disability) living outside the hospital, and smaller numbers who were long-term inpatients. A majority of the patients showing the highest degrees of clinical and social recoveries were not receiving treatment, while a majority of those who were most deteriorated were receiving or at least being prescribed medication. Findings emphasize the strong influence of the "natural course" of the illness on which physical and psychological treatment and social manipulations attempt to operate with varying degrees of success. (15 ref)—*Journal summary*.

9824. Tucker, Gary J.; Campion, Edward W. & Silberfarb, Peter M. (Dartmouth Coll, Medical School) **Sensorimotor functions and cognitive disturbance in psychiatric hospitals.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 17-21.—Studied 109 consecutive admissions to an acute psychiatric unit in a general hospital to determine the relationship of specific sensorimotor impairments to cognitive disturbance. Ss were assessed on results of the Goldstein-Scheerer Object Sorting Test and the Halstead Tactual Performance Test, a battery of symptom and diagnostic scales, routine and neurological history, and clinical interviews. Results indicate a strong but not exclusive correlation between neurological impairment and thought disorder as well as between neurological impairment and schizophrenia. Theoretical and etiological implications are discussed, as well as the relationship of these findings to other variables. (32 ref)—*Journal abstract*.

9825. Tuteur, Werner. (Loyola U, Chicago) **Dialogue in Dallas: Psychiatric examination of Jack Ruby.** *MH*, 1974(Spring), Vol 58(2), 6-10.—Presents findings and conclusions of a psychiatric examination of Jack Ruby, defendant in the death of Lee Harvey Oswald, assassin of the late President Kennedy. Diagnosis was that Ruby was suffering from schizophrenic reaction, paranoid type, could not differentiate between friend and foe and was judged to be incompetent to stand trial.

9826. Uhlenhuth, Eberhard H.; Lipman, Ronald S.; Balter, Mitchell B. & Stern, Martin. (U Chicago) **Symptom intensity and life stress in the city.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 759-764.—Studied relationships among self-rated symptom intensity, life stress of recent undesirable events, and demographic characteristics in a probability sample of 735 18-65 yr old urban adults. Symptom levels were assessed with the Hopkins Symptom Checklist, and life stress was measured with a questionnaire by E. S. Paykel et al. Higher symptom intensities were reported by women, the unmarried, whites, persons under medical care, the youthful, persons of lower social class, and those who experienced more life stress. Higher stress was

experienced by the unmarried, whites, persons under medical care, and the youthful. With effects controlled for one another, symptom intensity was associated only with sex, health care status, social class, and life stress. Results suggest higher life stress accounts partly for the higher symptom intensities among the unmarried, white, and youthful. Higher symptom intensities reported by women and persons of lower social class may be reflections and instruments of a life style. (25 ref)—*Journal abstract*.

9827. Welner, Amos; Croughan, Jack L. & Robins, E.L. (Washington U, Medical School) **The group of schizoaffective and related psychoses—critique, record, follow-up, and family studies: I. A persistent enigma.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 628-631.—A review of the literature indicates a considerable divergence of opinion regarding the nature of the group of schizoaffective and related psychoses. To resolve some of these controversies, record, follow-up, and family studies are described that will test the hypotheses that the schizoaffective and related psychoses are (a) a variant of schizophrenia; (b) a variant of affective disorder; (c) a third psychosis distinct from both schizophrenia and affective disorder; or (d) a group of psychoses that at first cannot be diagnosed and that eventually at follow-up are recognizable by the clinical picture, course, and family studies as schizophrenia or affective disorder. (76 ref)—*Journal abstract*.

9828. Wright, David M. (State U New York, Upstate Medical Ctr, Syracuse) **Impairment in abstract conceptualization in schizophrenia.** *Psychological Bulletin*, 1975(Jan), Vol 82(1), 120-127.—Discusses investigators' disagreements with K. Goldstein's (1940) and L. Vigotsky's (1934) notion that schizophrenics are impaired in abstract conceptualization. Following a review of terminological and theoretical issues, the evidence derived from investigations employing sorting test methods and principles is critically examined. Research findings are interpreted as strongly supporting the Goldstein-Vigotsky position. Critics' dissatisfaction with the early theorists' proposals appears to be based on a misunderstanding of Goldstein's and Vigotsky's ideas and a faulty assessment of the available evidence. (42 ref)—*Journal abstract*.

9829. Youkalis, Hildreth D. & DeWolfe, Alan S. (Northwestern U) **The regression hypothesis and sub-classifications of schizophrenia.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 36-40.—Evaluated regression as a descriptive concept in schizophrenia using L. E. Gottesman's 1964 forced-choice word association technique. Gottesman's finding (see PA, Vol 39:8487) that schizophrenics chose more children's associations than normals was extended. Diagnostic subtypes and premorbid adjustment within schizophrenics were compared using both male and female patients. A 40-item, forced-choice word association test was administered to 74 paranoid, nonparanoid, process, and reactive schizophrenics. The total number of responses typical of children, minus irrelevant responses, was analyzed. Paranoid schizophrenics gave significantly fewer responses of the type that children produce than nonparanoid schizophrenics, which was interpreted as

supporting the regression theory. (23 ref)—*Journal abstract*.

9830. Zern, David; Kenney, Helen J. & Kvaraceus, William C. (Clark U) **Cognitive style and overt behavior in emotionally disturbed adolescents.** *Exceptional Children*, 1974(Nov), Vol 41(3), 194-195.—A study of 42 middle-class adolescent residents and outpatients of a private mental hospital shows a significant mean difference on the cognitive style dimension between Ss classified as internalizers and those classified as externalizers; results are almost identical for males and females.

### Behavior Disorders

9831. Apfeldorf, Max. (VA Ctr, Martinsburg, WV) **Contrasting assumptions and directions in MMPI research on alcoholism.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1375-1379.—A review of 11 studies indicates that research on alcoholism using the MMPI can be divided into 2 groups: the first holds that alcoholism is a major category of disorder, derives special MMPI alcoholism scales, and finds that alcoholics have substantive personality characteristics different from those of other psychiatric patients. The 2nd group accepts a nosological system containing similar neurotic, psychotic, and psychopathic disorders and generally applies the usual clinical scales, excluding or underemphasizing special alcoholism scales. Guidelines are required to select the relevant nosology and MMPI scales in investigating alcoholics, which should stem from the original empirical emphasis of the MMPI. A classification system is needed which would separate alcoholics from other groups.—*Journal abstract*.

9832. Baekeland, Frederick; Lundwall, Lawrence; Shanahan, Thomas J. & Kissin, Benjamin. (State U New York, Downstate Medical Ctr, Brooklyn) **Clinical correlates of reported sleep disturbance in alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1230-1241.—The association between clinical and drinking history variables in 294 alcoholic outpatients indicated that current alcohol intake was more closely related to sleep disturbance than to physician ratings of anxiety or depression. When patients were classified according to drinking patterns (daily or periodic), abstinence at admission, and a history of black-outs and delirium tremens, the strength of the relationships between the variables differed (e.g., patients not abstinent at admission were younger, had higher levels of habitual alcohol intake, were more anxious and depressed, slept worse, and had been hospitalized more than patients who were abstinent at admission). Results are discussed in terms of the effect of alcohol on sleep and the relations between alcohol intake, sleep disturbances, and anxiety and depression. (25 ref)—*Journal abstract*.

9833. Barraclough, B.; Bunch, J.; Nelson, B. & Sainsbury, P. (MRC Clinical Psychiatry Unit, Graylingwell Hosp, Chichester, England) **A hundred cases of suicide: Clinical aspects.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 355-373.—Presents data on 100 suicides obtained retrospectively by interviewing surviving relatives. 93% of the suicides were diagnosed mentally ill, with 85% suffering from depression or alcoholism. 80% were seeing a doctor, and 80% had been prescribed psychotropic drugs. Over 50% had given

warnings of suicidal thinking. Some suicides may be preventable with modern psychiatric treatment, but the findings suggest that these methods are not always effectively deployed. (23 ref)—*Journal summary*.

9834. Bergman, Hans & Agren, Gunnar. (U Stockholm, Sweden) **Cognitive style and intellectual performance in relation to the progress of alcoholism.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1242-1255.—Used data on drinking patterns and symptoms of excessive drinking of 90 Swedish hospitalized alcoholics, 30 men each in the 18-30, 31-44, and 45-60 yr old age groups, to construct an "index of alcoholism" which was correlated with the results of psychometric tests administered after the patients were free from alcohol withdrawal symptoms. Performance on a general intelligence scale was similar to that of the general population; 42 men showed signs of impairment on the Trail Making Test and 14 on the Grassi Block Substitution Test; 13 men scored within the borderline area on the Memory for Designs Test; 60 men were classified as field dependent by the rod-and-frame test. There was no relationship between the severity of alcoholism and cognitive abilities or intellectual deterioration. The 24 patients with a history of delirium tremens or alcoholic hallucinosis were significantly more field dependent than the other patients. It is concluded that the clinical course of alcoholism does not lead to general intellectual impairment. (52 ref)—*Journal abstract*.

9835. Birtchnell, John & Floyd, Sandra. (MRC Clinical Psychiatry Unit, Graylingwell Hosp, Chichester, England) **Attempted suicide and the menstrual cycle: A negative conclusion.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 361-369.—Compared the observed distribution of suicide attempts with a calculated expected distribution which took into account the variability of menstrual cycle length. Data collected from 107 women included age and marital status, method of attempt, period of contemplation of attempt, regularity of menstrual periods, whether taking an oral contraceptive, and whether S believed she was pregnant. Analysis was restricted to 76 women with regular cycles. Results show no significant relationship between attempted suicide and phase of the menstrual cycle. It is pointed out that the menstrual function itself may be influenced by emotional disturbance, thus presenting methodological difficulties in the study. (16 ref)—*W. G. Shipman*.

9836. Burke, Aggrey W. (U Birmingham, Queen Elizabeth Hosp, England) **Socio-cultural aspects of attempted suicide among women in Trinidad and Tobago.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 374-377.—Studied differences in the distribution of female attempted suicides among East Indian and African populations in Trinidad and Tobago. Data from 90 admissions show that (a) there was a similar attempted suicide rate among all persons in each subcultural group; (b) East Indians were older (over 25 yrs) compared to the Africans; and (c) East Indians used more domestic substances in their suicide attempts (e.g., bleach) than Africans, although both groups gave similar reasons for their actions. Results support the view that sociocultural factors are important determinants of attempted suicide.—*Journal summary*.

9837. Clarke, Sandra K. (Akron Health Dept, Alcoholism Program, OH) **Self-esteem in men and women alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1380-1381.—Compared self-esteem, as measured by a modified SIO Q-Sort, of 20 female alcoholics (mean age 37.2) with that of 20 male alcoholics (mean age 40.7). Both groups had been abstinent a mean of 3 mo and did not differ in education, number married, or IQ. No comparisons of mean correlations between real-self-ideal-self, real-self-adjustment, or ideal-self-adjustment were significant.—*Journal abstract*.

9838. Crowe, Raymond R. (U Iowa, Coll of Medicine) **An adoption study of antisocial personality.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 785-791.—To test the hypothesis that heredity contributes to the development of antisocial personality a group of offspring born to female offenders and given up for adoption in infancy was examined. 46 probands and an equal number of control adoptees over 18 yrs old were followed up and interviewed using the MMPI and other measures of psychopathology. A significantly higher rate of antisocial personality was found among the probands than among the controls. The nonantisocial probands were not more deviant than the controls. The antisocial probands experienced certain unfavorable conditions in infancy that may be related to the development of antisocial personality, the most notable being the length of time spent in temporary care prior to final placement. Although the control group was equally exposed to the same conditions, they did not develop a high rate of the disorder. Findings point to the importance of interactions between genetic and environmental factors in the development of antisocial personality. (23 ref)—*Journal abstract*.

9839. Diaz, Shri S. **Institutional and after-care programmes for juvenile delinquents.** *Social Defence*, 1973(Oct), Vol 9(34), 9-17.—Discusses the incidence, causation, identification, and treatment of juvenile delinquency in India, as well as the various kinds of preventive programs such as boys' clubs. Aftercare programs and the adjustment of the rehabilitated offenders to a normal life are considered.

9840. Driver, M. V.; West, L. R. & Faulk, M. (Bethlem Royal Hosp, London, England) **Clinical and EEG studies of prisoners charged with murder.** *British Journal of Psychiatry*, 1974(Dec), Vol 125, 583-587.—Reports EEG data for 150 16-70 yr old male prisoners charged with murder, of whom 97 came to trial on that charge. The incidence of EEG abnormality was approximately equal to that found in a normal control group (10%). Relevant literature is discussed, and it is concluded that there is no strong case for routine EEG examination of all those being assessed prior to trial for murder.—*Journal summary*.

9841. Dudley, Donald L.; Roszell, Douglas K.; Mules, Janet E. & Hague, William H. (U Washington) **Heroin vs alcohol addiction: Quantifiable psychosocial similarities and differences.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 327-335.—After admission but before treatment, male veterans—66 alcohol addicts and 50 heroin addicts—were administered the Social Readjustment Rating Questionnaire, the Seriousness of Illness

Rating Questionnaire, and the Schedule of Recent Experience. High rates of life change were found for the 2 yrs before hospitalization of both groups. When using marriage as a standard, the alcoholics rated the other 42 life events as much less disturbing than did normals, while the drug addicts rated them as more disturbing than did normals.—W. G. Shipman.

9842. Ehrenkranz, Joel; Bliss, Eugene & Sheard, Michael H. (Yale U, Medical School) **Plasma testosterone: Correlation with aggressive behavior and social dominance in man.** *Psychosomatic Medicine*, 1974(Nov-Dec), Vol 36(6), 469-475.—Determined plasma testosterone in 36 male prisoners—12 with chronic aggressive behavior, 12 socially dominant without physical aggressiveness, and 12 who were not physically aggressive or socially dominant. Ss were administered the Scale of Susceptibility to Annoyances, the California Personality Inventory, the Adjective Check List, the Garabedian Index of Prison Socialization, the Lykken Measure of Anxiety, and the Buss-Durkee Hostility Inventory over the same time period. Results show that there was a significantly higher level of plasma testosterone in the aggressive group as compared with the nonaggressive group or with the other 2 groups combined. The socially dominant group also had a significantly higher level of testosterone than the nonaggressive group. (26 ref)—*Journal abstract*.

9843. Evenson, Richard C.; Sletten, Ivan W.; Altman, Harold & Brown, Marjorie L. (U Missouri, Medical School, Inst of Psychiatry, St Louis) **Disturbing behavior: A study of incident reports.** *Psychiatric Quarterly*, 1974, Vol 48(2), 266-275.—Factor-analyzed more than 5,000 incident reports (i.e., reports of disturbing patient behaviors) from a large state hospital and calculated actuarial risk-rates for the resulting 9 factors. Incident risk-rates are presented for sex, race, marital status, and diagnosis. Findings indicate that young, single males with deferred diagnosis were high incident risk, and that schizophrenic incident rates, when corrected for length of stay, were relatively low. (16 ref)—*Journal abstract*.

9844. Flores, J. R.; Garcia Trovato, M. & Salazar, H. (Hosp Docente Cayetano Heredia, Unidad de Psiquiatria, Lima, Peru) **[Male sexual dysfunction: I. Impotence.]** *(Span) Revista de Neuro-psiquiatria*, 1973(Sep), Vol 36(3), 191-200.—Reviews present knowledge about impotence. Its clinical, etiological, diagnostic, prognostic, and treatment aspects are described. The necessity of an integrated understanding and a practical approach to this disorder, mainly for general practitioners, is emphasized. (French & German summaries) (37 ref)

9845. Fox, Richard P. (U California, Irvine) **Narcissistic rage and the problem of combat aggression.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 807-811.—Makes a distinction between the aggression of combat soldiers reacting adaptively to situations of real danger and a type of combat aggression that is personally motivated by a quest for revenge. 3 case reports indicate that in contrast to the adaptive aggression that posed few postcombat difficulties, the latter type of aggression resulted in regressive ego (and superego) functioning and led to uncontrolled rages, combat atrocities, and post-combat difficulties in the handling of hostility and aggression. This latter type of aggression was traced to

narcissistic injuries and subsequent narcissistic rage, often the consequence of the death of a combat buddy (loss of a mirror relationship).—*Journal abstract.*

9846. Garitano, William W. & Ronall, Ruth E. (New Jersey Coll of Medicine, Newark) **Concepts of life style in the treatment of alcoholism.** *International Journal of the Addictions*, 1974, Vol 9(4), 585-592.—Discusses the alcoholic syndrome and its treatment in terms of the interaction of individual and cultural life styles. In terms of individual life style, the most common character traits of alcoholics are inadequacy, hypersensitivity, and immaturity. This preexisting individual life style is seen by the alcoholic as compatible with the accepted cultural life style of drinking. In terms of treatment, this model views alcoholism as the essential problem rather than as a symptom. The stages of therapy which focus on individual and cultural life styles are included.—*F. Beyer.*

9847. Gomberg, Edith S. (VA Hosp, Ann Arbor, MI) **Women and alcoholism.** In V. Franks & V. Burtie (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

9848. Goppinger, H. (Tübingen U, Inst of Criminology, W Germany) **Socio-psychological inquiries into the behaviour of men in the group 20-30 years: Differences between an average and a criminal population.** *Social Defence*, 1973(Oct), Vol 9(34), 3-8.—Compared a group of prison inmates with a control group of normal persons of the same age. Studies were carried out by a team of lawyers, psychologists, psychiatrists, sociologists, and social workers. Findings indicate that the prisoners were poor in school and often were dropouts, discontinued vocational training, lacked interest in work, and changed jobs frequently. Little parental control was given and their interests lay outside the home. Leisure-time activities were unstructured and often were associated with drinking. The control group exhibited strong family ties, orienting leisure-time activities toward the home. They had good work and school records. Relevant bindings appeared to be stable for nonprisoners, with the emphasis on family harmony and security and a regular result-oriented occupation. The successful rehabilitation of prisoners apparently depends on substituting social nondeviant bindings for the bindings that lead to criminality.—*A. de la Haba.*

9849. Green, Richard. (State U New York, Stony Brook) **Sexual identity conflict in children and adults.** Baltimore, MD: Penguin, 1975. xxii, 327 p. \$3.95.—Discusses the historical, cross-cultural, biological, psychological, and treatment aspects of transsexuality. Interviews with adult transsexuals who discuss their childhoods and adjustments to life as members of the opposite sex, and the treatment, causative factors, behavior, stories, and parental descriptions of children who already want to change their sex at age 5 or 6 are presented in detail. (8 p ref)

9850. Hess, Allen K. & Briniger, James R. (Oakland U) **Self-described anxiety and mood in juvenile delinquents.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 389-391.—Investigated whether the distinction between primary and neurotic psychopathy is reflected in different self-descriptions of mood. Ss were 24 13-17

yr old male incarcerated delinquents. The Personal Opinion Study (POS), Marlowe-Crowne Social Desirability scale (MCSD), Anxiety Differential (A-D), and Psychiatric Outpatient Mood Scale (POMS) were administered. Findings indicate that correlations of the mood and anxiety scales with the POS Primary and Neurotic scales were similar. The only differences were found on the POMS Confusion scale (which correlated .35 with Primary and .52 with Neurotic), the A-D (.41 with Primary and .27 with Neurotic), and MCSD (-.28 with Primary and -.55 with Neurotic). Thus a higher Primary score was not correlated with self-reported lack of anxiety and lowered emotional states, contrary to the hypothesis.—*P. O'Brien.*

9851. Hogenson, Dennis L. **Reading failure and juvenile delinquency.** *Bulletin of the Orton Society*, 1974, Vol 24, 164-169.—Studied reading failure and the history of aggression of confined juvenile delinquent males. 2 groups of 48 each were randomly selected from state training schools in Lansing, Michigan, and Red Wing, Minnesota. Data were collected on social and behavioral history, the WISC, reading achievement score on the Stanford Achievement Test (SAT), the Minnesota Attitude Inventory (MAI), the Dogmatism Scale, and on each S's family, community, economic, and ethnic background. Spearman rank order correlations yielded significant results between reading and aggression (Lansing  $r = .33$ ,  $p < .025$ ; Red Wing  $r = .40$ ,  $p < .005$ ). The MAI was also correlated with aggression. IQ was related to reading success. It is concluded that reading failure may be the single most significant factor in antisocial aggressive delinquents. 5 suggestions are offered to prevent frustration stemming from reading failure. (28 ref)—*G. R. Alley.*

9852. Jovčević, Milanko et al. (Military Medical Academy, Belgrade, Yugoslavia) **[Pre-army delinquency and resocialization in the army.]** (Srcr) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(3), 51-60.—Compares several parameters of adaptive behavior in Army inductees with and without juvenile delinquency records. (English summary)

9853. Kurtines, William; Hogan, Robert & Weiss, Daniel. (Florida International U, Miami) **Personality dynamics of heroin use.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 87-89.—Compared 59 white male heroin addicts with 26 psychiatric patients, 142 incarcerated delinquents, 37 undergraduate marijuana users, and 108 police officers using the California Psychological Inventory. Results suggest that the heroin users were relatively normal in terms of social poise and self-esteem; however, they were significantly more hostile, rebellious, and irresponsible than any of the comparison groups. The addicts seemed relatively well adjusted, suggesting that their drug use is symptomatic not of neurosis but of a generalized antisocial disposition.—*Journal abstract.*

9854. Lester, David & Lester, Gene. (Richard Stockton State Coll) **Crime of passion: Murder and the murderer.** Chicago, IL: Nelson-Hall, 1975. x, 306 p. \$10.—Presents a comprehensive analysis of the incidence, types, and possible causes of murder using data obtained from government agencies, the Uniform Crime Reports, and major sociological and psychological concepts and

theories of human aggression. Patterns that apply to the victims and murderers are identified, and philosophical, legal, and moral factors in murder are examined. (11/ p ref)

9855. Linder, Helen; Zambrowsky, J. & Cormier, Bruno-M. (McGill U, Montréal, Québec, Canada) [Pathologic cohesion in multidelinquent families.] (Fren) *Vie Médicale au Canada Français*, 1974(Jun), Vol 3(6), 593-597.—Studied 100 "mature" families with a number of persistent or incidental delinquents ranging from 2 to all their boys. It was found that 75% of the families had 5-12 children, 26% were voluntarily broken, 41% had placed children in reform schools, and 90% of the delinquents always returned home. Broken and intact homes produced about the same number of delinquents, and in 77% of the families the younger generation lived on a social level lower than their parents. It is concluded that a certain cohesion does exist beyond the formative years in such cases, but that psychologists ought to look more conscientiously to the needs of the underprivileged. —L. Klinkon.

9856. Long, J. Alan & McLachlan, John F. (St Michael's Hosp, Toronto, Ontario, Canada) Abstract reasoning and perceptual-motor efficiency in alcoholics: Impairment and reversibility. *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1220-1229.—Administered a battery of IQ and neurological tests to a total of 39 upper social class male alcoholics (mean IQ = 125.9) in 2 studies. Compared with controls matched for age, sex, education and verbal IQ, alcoholics were significantly impaired on the WAIS Block Design, Object Assembly, and Digit Symbol subtests, the Trail Making Test, the Halstead Category Test, Tapping Right and Left Hand, and according to a modified index based on scores from the Halstead Neuropsychological Battery and the Trail Making Test. In Study II, an additional 17 alcoholics, whose initial scores were not different from those in Study I, were retested after 1 yr's abstinence: significant improvement was found in all Study I indicators except the Trail Making Test. Impairment was found as often in the present Ss as it was in groups of alcoholics of average intelligence and of lower social class in other similar studies. It is concluded that peripheral and central nervous system recovery is possible with prolonged abstinence from alcohol. (16 ref) —Journal abstract.

9857. Masterson, James F. (Cornell U, Medical Coll, New York) The acting-out adolescent: A point of view. *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 343-351.—Examines the etiology and treatment of acting-out adolescents. Definitions of acting out are discussed and illustrated with case examples. The therapeutic relationship formed between patient and therapist is reviewed. Differential diagnosis of the sources of acting out are offered and the therapeutic management of the acting-out borderline adolescent is described. In this case, acting out is viewed as a defense against abandonment depression and as a means of testing the therapist. The patient is attempting to restore the pathologic relationship with the mother. He is also afraid that if he allows a relationship with the therapist to develop he will again be abandoned. The difference to develop he will again be abandoned. The difference between inpatient and outpatient management of acting

out is discussed. It is suggested that limits on behavior, more difficult for outpatient therapy, can be set prior to the formation of a therapeutic relationship. To illustrate, the case of a 16-yr-old male patient is presented.—R. S. Albin.

9858. McKissack, Ian J. (U Waikato, New Zealand) A less delinquent cohort. *British Journal of Criminology*, 1974(Apr), Vol 14(2), 158-164.—Reports that adolescent delinquency rates were considerably below expectation among children born in Scotland in 1946-1947. The finding is discussed in relation to the above-average proportion of 1st-born children in the period and parental attitudes immediately after World War II.

9859. Mintz, Jim; O'Hare, Kate; O'Brien, Charles P. & Goldschmidt, Jean. (U Pennsylvania) Sexual problems of heroin addicts. *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 700-703.—Surveyed 136 19-52 yr old heroin-addicted veterans for problems of impotence, premature ejaculation, and retarded ejaculation when the Ss were drug free and when they were using heroin 45 were in methadone treatment and also reported on methadone effects. Premature ejaculation was a surprisingly common complaint when Ss were drug free, but it remains unclear whether this finding represents true base line levels or subtle abstinence reactions. Heroin and methadone both increased the frequency of impotence and retardation, though the effects of heroin were substantially more dramatic.—Journal abstract.

9860. Moser, Joy. (World Health Organization, Office of Mental Health, Geneva, Switzerland) Problems and programmes related to alcohol and drug dependence in 33 countries. Geneva, Switzerland: World Health Organization, Offset Pub No 6, 1974. iii, 106 p. Presents an analysis of the discussions and findings of 2 seminars on the problems associated with alcohol and drug dependence which were sponsored by the World Health Organization in 1971 and 1972. Examples of preventive and treatment services in 6 countries are presented, and legal and penal aspects of addiction and research and program planning issues are discussed. (3/ p ref)

9861. Moullembé, Ariette et al. (U Paris X-Nanterre, France) [Essay on suicide: A theoretical and a clinical approach.] (Fren) *Bulletin de Psychologie*, 1973 1974, Vol 27(15-18), 804-943.—Presents a theoretical discussion of suicide based on historical and statistical data. Among the aspects considered are the possibility of a psychopathological structure of suicide, factors in suicide, types of suicide, causative behavior, and characteristics of suicide in children and adolescents. A clinical study is reported in detail which compared 11 male and 17 female 6-16 yr olds who had attempted suicide with a group of children and adolescents presenting psychosomatic problems. Members of both groups exhibited similar characteristics but Ss in the suicide group did so to a much greater degree. These Ss came from disturbed families and had experienced severe and prolonged losses of support, affection, and parental image. Alcoholism and conflicts were frequent among parents. Ss experienced difficulties in parental and sibling relations. IQs were normal but there was evidence of academic failures. Ss were aggressive, depressed, anxious, guilty, and demanding of attention. The theoretical and clinical

data presented indicate that (a) suicides are found in various nosological categories and (b) although the characteristics of suicides appear in other groups, records of the groups studied seem to point to a "suicide syndrome." (77 ref)—*Z. M. Cantwell*.

9862. Nail, Richard L.; Gunderson, E. K. & Kolb, Douglas. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **Family characteristics associated with heroin dependence among Navy men in Vietnam.** *Military Medicine*, 1974(Dec), Vol 139(12), 967-970.—Compared family characteristics of 240 US Navy men diagnosed as dependent upon heroin with a control group of men who had not used heroin. The hypothesis was tested that heroin-dependent individuals would exhibit specific family characteristics (low socioeconomic status, broken home, and poor relationships with parents and siblings) compared with other Navy men who used drugs but not heroin. Differences between the 2 groups were small but generally in the opposite direction to that predicted. No evidence was found for the specificity hypothesis among heroin addicts who principally used inhaling (smoking or sniffing) as the method of administration. Those who injected heroin, however, did show family differences and represent a different type of drug abuser than those who only inhale heroin.—*Journal abstract*.

9863. Neuringer, Charles. (U Kansas) **Suicide and the Rorschach: A rueful postscript.** *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 535-539.—A review of the Rorschach suicide literature written 10 yrs ago called for cross-validation studies and the use of refined methodology to enhance the usefulness of the test as a device for the identification, prediction, and understanding of suicidal ideation and behavior. The present follow-up review indicates that careful and refined research methodology can somewhat enhance sensitivity of the Rorschach to suicidal activity. It is concluded that the replicative research has not supported previously promising Rorschach suicide indicators, suggesting that the Rorschach may be an inappropriate technique for assessing suicidal activity. (19 ref)—*Journal abstract*.

9864. O'Leary, Michael R.; Donovan, Dennis M. & Hague, William H. (VA Hosp, Seattle, WA) **Interpersonal differentiation, locus of control and cognitive style among alcoholics.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 997-998.—Investigated the relationship between Rotter's Internal-External Control Scale (I-E) and 2 measures of cognitive style, the Group Embedded Figures Test (EFT), and the Interpersonal Discrimination Test, for 50 alcoholics (mean age = 47.7 yrs). The I-E scale did not correlate significantly with either the EFT or the discrimination test. The latter 2 scales correlated significantly with each other. It is concluded that perceived locus of control and cognitive style are independent constructs.—*Journal abstract*.

9865. Prokupek, J. (Inst Lékařů a Farmaceutů, Prague, Czechoslovakia) **[Esquirol's concepts of suicide.]** (Czec) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 133-138.—Discusses E. Esquirol's background, work, and ideas about the psychopathology of suicide, first published in his 1836 textbook of psychiatry. The conclusion is presented that although many of Esquirol's views are still valid, they cannot be accepted as a whole

because since his time the theory and practice of psychiatry, and our whole society, have reached a higher level of development. (Russian & English summaries)—*V. Fischmann*.

9866. Roberts, Alan H.; Erikson, Robert V.; Riddle, Mary & Bacon, Jane G. (U Minnesota, Minneapolis) **Demographic variables, base rates, and personality characteristics associated with recidivism in male delinquents.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 833-841.—Studied demographic variables, base rates, and personality characteristics of 455 adolescent male delinquents in 3 studies. The total population discharged from a treatment-oriented facility was followed, and data were recovered from 98%. The recidivism rate was 37.5%, which compares to the recidivism base rates found in similar rehabilitation facilities. Significantly higher rates of recidivism were found among the younger delinquents, delinquents with prior institutional experience, and delinquents who had previously run away from an institution. Measures of impulse control and foresight and planning ability derived from the Porteus Maze Test differentiated 10 recidivists from 10 nonrecidivists. A follow-up study of 68 consecutively discharged Ss from the same institution replicated the findings with respect to impulse control but not foresight and planning ability. One measure of future time perspective and some staff ratings were also related to recidivism. (20 ref)—*Journal abstract*.

9867. Romildo Bueno, J. (U Federal do Rio de Janeiro, Faculdade de Medicina, Brazil) **[Drug dependency as a disease.]** (Port) *Jornal Brasileiro de Psiquiatria*, 1972(Jan), Vol 21(1), 127-137.—Argues that drug dependency should be studied and treated independently of its intrapsychic and social aspects. The usual phases of developing and stabilizing drug dependency are reviewed. Continuing medical treatment, rather than imprisonment, is indicated.

9868. Rosén, Anne-Sofie & Schalling, Daisy. (U Stockholm, Sweden) **On the validity of the California Psychological Inventory Socialization Scale: A multivariate approach.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 757-765.—Isolated groups homogeneous in role-taking ability and described them on dimensions of the California Psychological Inventory (CPI) Socialization (So) scale. Ss were 189 Swedish delinquent and nondelinquent 19-31 yr old males. 6 subscales were constructed by factor analysis. A latent profile analysis of responses to 18 items, selected from the subscales, yielded a low ( $n = 78$ ) and a high ( $n = 106$ ) socialization group. 75% of the delinquents were classified as the low group. In a discriminant analysis of subscale scores, the latent profile analysis groups were significantly separated. 5 subscale means were significantly different. Results support the validity of some of the subscales as indicators of the role-taking construct underlying the So scale. (38 ref)—*Journal abstract*.

9869. Rotenberg, Mordecai. (Hebrew U Jerusalem, Paul Baerwald School of Social Work, Israel) **Conceptual and methodological notes on affective and cognitive role taking (sympathy and empathy): An illustrative experiment with delinquent and nondelinquent boys.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2),

177-185.—Reviews the ambiguity and inconsistency found in operational definitions and empirical measures of empathy and sympathy. The terms "affective role taking" and "cognitive role taking" are offered as substitute operational concepts. Affective and cognitive role-taking dispositions are assessed separately on the same Ss. Preliminary findings comparing 37 delinquents and 36 nondelinquents suggest that the delinquents were in no way deficient in cognitive role-taking skills, while they were significantly lower than nondelinquents in affective role taking. Unexpected findings indicate that black delinquents perceived their past relations with home and peers in significantly warmer terms than did white delinquents. The generality of theoretical formulations concerning the relation between socialization processes and aggression or delinquency are seriously questioned. (37 ref)—*Journal abstract*.

9870. Schindler, Sepp. (U Salzburg, Psychologisches Inst, Austria) [Family constellation and aggressive conduct.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1974(Jan), Vol 22(2), 180-182.—Obtained data on the number of siblings in the families of 317 male juveniles who had been convicted of assault and battery, and investigated characteristics of familial socialization and manifest aggressive behavior. Families with more children provide a better opportunity for learning conflict solution through aggressive behavior than families with only 1 child. There is a direct relationship between number of siblings and percentage of aggressive male offenders, only children showing the lowest percentage.—S. D. Babcock.

9871. Schuckit, Marc A. & Gunderson, E. Eric. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **Suicide in the naval service.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1328-1331.—Analyzed records of all suicides in the naval service between July 1965 and January 1972 by officer/enlisted-man status. Officer suicides were demographically similar to civilian suicides, but enlisted men were relatively younger. Data on this sample were compared with demographic data on men in the naval service who attempted or threatened suicide and with the general service population. A relatively small proportion of the suicide sample (10%) had had inservice psychiatric hospitalizations. Findings in relation to possibilities for increased detection of the potential for suicide are discussed. (17 ref)—*Journal abstract*.

9872. Shaffer, David. (Inst of Psychiatry, London, England) **Suicide in childhood and early adolescence.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Oct), Vol 15(4), 275-291.—Conducted a survey on all reported childhood suicides in England and Wales over a 7-yr-period ( $N = 30$ ). Results show that there were no deaths reported before the age of 12. All the cases studied were aged 12-14 and more than twice as many boys as girls; the group included more tall children and more children of superior intelligence than was expected in the general population. Antisocial behavior had been reported in most of the children before death. Suicide was most often precipitated by a disciplinary crisis and often took place after a period away from school. Previous suicidal behavior was noted in 40% of the cases. There was a high incidence of

depression and suicidal behavior among the children's parents and siblings. (56 ref)—*Journal summary*.

9873. Shukla, T. R. (Hosp for Mental Diseases, Ranchi, India) **A study of some of the socio-psychological factors among adolescent criminals.** *Indian Journal of Psychiatric Social Work*, 1972(Jul), Vol 1(1), 31-35.

9874. Singer, Melvin. (Inst of the Pennsylvania Hosp, Adolescent Treatment Ctr, Philadelphia) **Delinquency and family disciplinary configurations: An elaboration of the superego lacunae concept.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 795-798.—Used the combination of observations of the total family together and an elaborate rating form to analyze disciplinary patterns in middle-class families with an antisocial offspring. Discipline was divided into 3 sequential dimensions: policy making, policing, and punishing. Each dimension had specific interactional characteristics that could be compared. A disciplinary configuration quite different from the usually described patterns of "permissiveness" and "inconsistency" arrived at from more global observations of dyadic processes was revealed by this method. Instead the disciplinary configuration in these families with an antisocial offspring was very restrictive policy making, loose policing, and very lenient punishing. This configuration, on its own, seemed to create a powerful antisocial channel that had to be considered as an additional dynamic in the understanding of delinquent events by these antisocial offspring. (27 ref)—*Journal abstract*.

9875. Smith, Selwyn M.; Hanson, Ruth & Noble, Sheila. (U Birmingham, Queen Elizabeth Hosp, England) **Social aspects of the battered baby syndrome.** *British Journal of Psychiatry*, 1974(Dec), Vol 125, 568-582.—Presents data on demographic, social, and family characteristics of the parents of 134 battered children under 5 yrs of age and 53 control children who were emergency admissions and showed no evidence of battering. All parents of the battered children had either confessed to the injuries or could give no adequate explanation for the child's condition. Descriptive data on marital status, illegitimacy rates, attitudes to pregnancy and abortion, contraceptive practices, family size, extent of family disharmony, religion, social isolation, worries, income and socioeconomic status, and father's occupation are presented. Overall findings suggest that a lack of family cohesiveness is an important factor in the battered-child syndrome. In over one-third of the cases, the biological father was absent, and in half the cases, the mother was living with another man. Premarital pregnancy and illegitimacy, marital discord, and rejecting attitudes toward the child were also related to child battering. (73 ref)—L. Gorsey.

9876. Stein, Marvin; Levy, Michael T. & Glasberg, H. Mark. (Mt Sinai School of Medicine, City U New York) **Separations in black and white suicide attempters.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 815-821.—Studied childhood and antecedent separations in 330 white and black suicide attempters and matched control nonsuicidal psychiatric patients. There were more white and female suicide attempters with a history of childhood and antecedent separations than controls. Social class did not account for this finding. The number of black male and female patients with early

childhood separations was greater in the suicide attempt groups than in the control groups. There was also no significant interaction between childhood and antecedent separation and suicide attempt in the white and black female and male patients. (23 ref)—*Journal abstract.*

9877. Toler, Curt. (VA Hosp, Vancouver, WA) **The personal values of alcoholics and addicts.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 17-20.—Investigated the personal values of 43 male drug addicts and 42 alcoholics using the Rokeach Value Survey. The 2 groups did not differ from each other, but did differ from the general population in preferring personal goals rather than societal ones.

9878. Virkkunen, Matti. (Helsinki U, Central Hosp, Psychiatric Clinic, Finland) **Suicide linked to homicide.** *Psychiatric Quarterly*, 1974, Vol 48(2), 276-282.—Conducted a 15-yr study in Finland of 126 cases of suicides directly linked to homicide. Results indicate that during that period, the rate of suicide directly linked to homicide was the same in rural and urban areas. The rate proved to be no higher in underdeveloped areas than elsewhere. Only 17.5% of the offenders had undergone psychiatric hospital care. Schizophrenia and other paranoid psychoses appeared most frequently in the diagnoses.—*Journal abstract.*

9879. Warren, Carol A. (U Southern California) **The use of stigmatizing social labels in conventionalizing deviant behavior.** *Sociology & Social Research*, 1974(Apr), Vol 58(3), 303-311.—Points out that labeling theory has thus far focused on a 1-way relationship between negative social labels and behavior: the application of such labels facilitates further deviant behavior. On the basis of empirical evidence from 6 behavior-changing groups of various types, it is suggested that the application of negative labels may under certain conditions conventionalize deviant behavior; e.g., when the labels lead to voluntary membership in the group or to counseling by previously stigmatized persons. It is further contended that the direction of change may be different for behavior and for identity. An individual may develop a stigmatized identity as a precondition for conventionalized behavior, or a normalized identity and conventionalized behavior, as well as the stigmatized identity and escalated deviant behavior described by labeling theory. (21 ref)—*R. V. Heckel.*

9880. Wax, Douglas E. (U Michigan, Medical Ctr) **Self-concept in Negro and white pre-adolescent delinquent boys.** *British Journal of Criminology*, 1974(Apr), Vol 14(2), 165-171.—Studied differences in self-concept between black and white preadolescent delinquent boys. 20 black and 35 white preadolescent delinquents completed 10 semantic differential scales on each of 8 concepts. Only one concept attained a significant level of difference between the 2 groups. "Boys who get into trouble" was perceived by the black group as generally a more positive concept. Results are discussed in relation to current social forces within the urban black community. (21 ref)—*Journal summary.*

9881. Weiner, Sheldon & Weaver, Lelon. (U Vermont, Coll of Medicine) **Begging and social deviance on Skid Row.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec),

Vol 35(4), 1307-1315.—Examined various aspects of street begging by comparing questionnaire responses of 100 Skid Row alcoholics who admitted to panhandling (PH) with those of 100 alcoholics who denied it (NPH). Findings suggest that (a) panhandling is found in a relatively small proportion of alcoholics (e.g., the present Ss were drawn from the very bottom of the alcoholic population, yet only 41% reported that they had ever begged for money); (b) PH's behavior clearly deviated further from the social norm than the NPH's on almost all measures; (c) the fact that the PHs were 10 yrs younger than the NPHs suggests that the panhandling is not the result of alcoholic deterioration over time; and (d) a number of social and behavioral characteristics related to alcoholism differentiated the 2 groups (e.g., the PH group had more men who had been arrested for felonies and fewer who had no records of arrests, the NPH preferred whisky while the PH group had less rigid alcohol preferences, and over 50% of the PH group drank nonbeverage alcohol compared with only 25% of the NPH group). Implications of the findings for alcoholic prognosis in terms of the level of self-respect are noted.—*Journal abstract.*

#### Learning Disorders & Mental Retardation

9882. Aitaksinen, E. M. & Kauko, K. (U Helsinki, Finland) **Effect of probenecid on 5-hydroxyindoles in cerebrospinal fluid in Down's syndrome.** *Annals of Clinical Research*, 1973(Dec), Vol 5(6), 392-394.—Measured total 5-hydroxyindoles in the cerebrospinal fluid (CSF) of 6 7-14 yr old patients with Down's syndrome (DS) and 6 mentally retarded controls before and after probenecid administration (40 and 80 mg/kg/day for 2 days). In both groups the values were similar before the probenecid, but after both doses of probenecid they were lower in the patients with DS than in the controls. This result was related, at least partly, to the lower concentration of probenecid in the CSF. (19 ref)—*Journal abstract.*

9883. Aitaksinen, E. M.; Aitaksinen, M. M. & Penttinen, P. (U Helsinki, Finland) **Fate of <sup>14</sup>C-labelled tryptophan and 5-hydroxytryptophan in Down's syndrome.** *Annals of Clinical Research*, 1973(Dec), Vol 5(6), 385-391.—Administered <sup>14</sup>C-tryptophan with carrier to 4 Down's syndrome (DS) patients and to 5 mentally retarded controls, and <sup>14</sup>C-5-hydroxytryptophan (5HTP) to 3 DS patients and 3 controls. Radioactivity was measured in samples of blood, spinal fluid (CSF), urine, and feces. The level of radioactivity in the plasma 1 hr after tryptophan as well as after 5HTP was similar in the DS patients and controls, but the 4 hrs' activity after tryptophan was higher in DS patients. The rate of elimination of plasma radioactivity was very slow after tryptophan but fast after 5HTP in both groups. The CSF of all Ss contained considerable radioactivity after <sup>14</sup>C-tryptophan, but was hardly detectable after <sup>14</sup>C-5HTP. The major urinary metabolites of tryptophan and 5HTP did not show gross differences between the DS and control patients. The increase in the concentration of plasma tryptophan after tryptophan loading (100 mg/kg) was smaller in the DS patients than in the controls. Results, together with those using labelled tryptophan, suggest that there are no gross abnormalities in the absorption of tryptophan, but that disturbances in its

metabolism and/or transport occur. (25 ref)—*Journal abstract*.

9884. Brekke, Beverly & Williams, John D. (U North Dakota, Ctr for Teaching & Learning) **Conservation of weight with the mentally retarded.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 225-231.—Institutionalized retardates ( $N = 54$ ), public school retardates ( $N = 65$ ), and a group of normal Ss ( $N = 112$ ) were compared at several mental age levels on 3 conservation of weight tasks. Results show that the functioning of normal Ss was higher at each mental age level. An analysis of covariance was performed on the number of correct responses on the 3 tasks, covarying mental age, and not including any normal Ss above 13 yrs in mental age ( $N = 82$ ). Normal Ss conserved significantly more often than either retardate group in the covariance analysis.—*Journal abstract*.

9885. Browder, J. Albert; Ellis, LuAnn & Neal, Judith. (U Oregon, Medical School, Portland) **Foster homes: Alternatives to institutions?** *Mental Retardation*, 1974(Dec), Vol 12(6), 33-36.—Examined 36 foster home child units to examine factors which may be related to the outcome of most foster care programs for retarded and handicapped children. Over half of the children resided in foster homes which needed substantial improvement.

9886. Bryan, Tanis H. (U Illinois, Coll of Education, Chicago Circle) **Peer popularity of learning disabled children.** *Journal of Learning Disabilities*, 1974(Dec), Vol 7(10), 621-625.—Administered a combination of 2 sociometric measures to 62 Ss in 3rd-, 4th-, and 5th-grade classrooms in which there was at least 1 learning-disabled child. An analysis of variance was computed for votes received on scales of social attraction and social rejection by learning-disabled and comparison Ss matched on variables of sex, race, and classroom. Results indicate that learning-disabled children, particularly white and female, were significantly less attractive and more rejected than comparison children.—*Journal abstract*.

9887. Burcham, Temmie et al. **Effects of auditory reception on auditory and visual learning tasks.** *Education & Training of the Mentally Retarded*, 1974(Apr), Vol 9(2), 56-61.—Studied the effect of auditory reception on the learning of auditory and visual paired associate learning tasks in 72 educable retarded 9-13 yr old males. The 1st hypothesis was that high auditory receivers will perform significantly better than low auditory receivers on the auditory paired associate learning task. The 2nd hypothesis was that there will not be a significant difference between high auditory receivers and low auditory receivers on the visual paired associate learning tasks. Results indicate that auditory discrimination, as measured by the Wepman Auditory Discrimination Test, was a significant factor in auditory learning. High auditors performed significantly better than low auditors on the auditory paired associate learning task. There was no significant difference between high auditors and low auditors on the visual paired associate learning task.—*Journal abstract*.

9888. Byrne, Brian M.; Willerman, Lee & Ashmore, Lear L. (U Texas) **Severe and moderate language impairment: Evidence for distinctive etiologies.** *Behav-*

*ior Genetics*, 1974(Dec), Vol 4(4), 331-345.—42 3-8 yr old children with at least normal nonverbal intelligence and a diagnosis of "delayed speech" were subdivided into those having "moderate" and those having "severe" speech difficulties on the basis of the Illinois Test of Psycholinguistic Abilities. It was found that (a) parents of Ss with severe speech difficulties were of higher social class than those of Ss with moderate speech difficulties and (b) Ss with severe speech difficulties were more likely to have been exposed to potentially traumatic environmental influences and less likely to have relatives with speech disturbances than moderately affected Ss. Data indicate the heterogeneity of the diagnosis of "delayed speech" and suggest parallels to findings in the area of mental retardation, namely, that moderate deficiencies represent the lower end of the normal curve distribution from either a genetic or an environmental perspective, while severe deficiencies are the result of single genes or of serious environmental traumas. (16 ref)—*Journal abstract*.

9889. Carter, John L. (U Houston) **The educable mentally retarded choose their art activities: Two-dimensional or three-dimensional.** *Art Psychotherapy*, 1973(Fal), Vol 1(2), 141-144.—28 educable mentally retarded children (mean chronological age 11 yrs, mean mental age 6 yrs) were given the choice of 4 art activities: 3-dimensional (assemblage of colored blocks or paper sculpture) and 2-dimensional (tempera painting or collage of colored papers). Tested individually, 24 Ss chose painting, 2 chose paper cutting, and only 2 chose block assemblage. The choice was related neither to sex nor to IQ. A rigid clinging to familiar objects and techniques may account for the preference for 2-dimensional media.—*R. Arnheim*.

9890. Clark, D. F. & Johnston, A. W. (Ladysbridge Hosp, Banff, Scotland) **XYX individuals in a special school.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 390-396.—Presents psychological and anthropometric data on 5 12-, 16-, and 21-yr-old XYX Ss in a special school for the retarded in Scotland. The 5 Ss were all of borderline intelligence, with a mean IQ approximately 2 standard deviations below the general population mean. There was some evidence of a tendency toward performance rather than verbal dominance in cognitive skills, but also evidence of motor carelessness and impulsivity. Social maturity was also below normal. Data support the idea that additional XYX Ss will be found in normal as well as institutional or "mental-penal" situations, and also support the likelihood of finding such individuals among low intelligence, borderline, and retarded populations. (33 ref)—*Journal summary*.

9891. Fenton, Thomas R.; Alley, Gordon R. & Smith, Kenneth. **Effects of white noise on short-term memory of learning disabled boys.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 903-906.—5 levels of white noise (22-72 db) introduced during the performance of a short-term memory task (repeating 4-digit numbers) did not differentiate scores of 10 normally achieving 9-11 yr old boys from 10 boys with learning disabilities. For all boys together, increasing noise levels decreased performance of younger Ss relative to that of older Ss.—*Journal abstract*.

9892. Frankel, Fred & Tymchuk, Alexander J. (U California, Medical School, Los Angeles) **Digit recall of mentally retarded and nonretarded children under three presentation rates.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 311-319.—2 groups of nonretarded children were matched on chronological age (CA) mean of 10 yrs and on Peabody Picture Vocabulary Test mental age (MA) with 27 mildly retarded children. The 3 groups were presented with a serial recall task similar to the forward series of the Digit Span subtest of the WISC. Digit strings of systematically increasing length were presented aurally at each of 3 presentation rates. The maximum length of digits Ss were able to recall correctly was found to be related to IQ, but not to MA or CA. The fastest rate of presentation produced significant increases in the accuracy of recall for all groups. Separate serial position analyses for strings containing different types of errors revealed strikingly different serial position functions for each error type. (38 ref)—*Journal abstract*.

9893. Gottlieb, Jay. (Research Inst for Educational Problems, Cambridge, MA) **Attitudes toward retarded children: Effects of labeling and academic performance.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 268-273.—The influence of the label "mentally retarded" on the attitudes of peers was investigated in 2 experiments—one with a middle-class sample and the other with a low-socioeconomic status (SES) sample. 48 middle-class and 40 low-SES 4th graders were shown 1 of 2 video tapes of 2 children taking a spelling bee. Half of the Ss saw the target actor as being a competent speller while the remaining half saw him as an incompetent speller. Half of each group was told that the target actor was either a 5th-grade pupil or a mentally retarded boy in a special class. Data from the 2 sets of  $2 \times 2$  (Label  $\times$  Competence) replications indicate that the label did not significantly affect attitude scores. For the middle-class sample, academic performance was a significant influence on expressed attitudes, with incompetent performance resulting in more negative evaluations. Academic performance did not affect attitude scores among the low-SES sample. Data indicate that labels do not adversely influence the attitudes of peers toward labeled children. (23 ref)—*Journal abstract*.

9894. Guskin, Samuel L. (Indiana U) **Research on labeling retarded persons: Where do we go from here? A reaction to MacMillan, Jones, and Aloia.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 262-264.—Suggests that D. L. MacMillan et al's review and analysis (see PA, Vol 53:Issue 5) leads to little optimism about further research in the area, and that research and evaluation activities should be developed for modifying labeling effects.

9895. Hill, A. Lewis. (New York State Inst for Basic Research in Mental Retardation, Staten Island) **Idiot savants: A categorization of abilities.** *Mental Retardation*, 1974(Dec), Vol 12(6), 12-13.—Presents 7 general categories of special abilities of idiot savants—fine sensory discriminations; artistic talent; unusual mechanical, musical, and mathematical abilities; memorization of obscure facts; and calendar calculating. (52 ref)

9896. Jacobs, Patricia A. (MRC Clinical & Population Cytogenetics Unit, Western General Hosp, Edinburgh, Scotland) **Correlation between euploid structural chro-**

**mosome rearrangements and mental subnormality in humans.** *Nature*, 1974(May), Vol 249(5453), 164-165.—Describes data obtained from examination of blood leukocyte chromosomes of 33,533 people in an Edinburgh clinic between 1959 and 1972. 94 euploid structural rearrangements were found. The relationship between this abnormality and mental retardation in this group is discussed.

9897. Lowe, James D.; Roberts, Margaret & Whidden, Michael. (U Southern Mississippi) **WISC scores vs full scale and abbreviated WAIS scores for retarded adolescents.** *Southern Journal of Educational Research*, 1974(Sum), Vol 8(3), 326-331.—Investigated differences between WISC Full Scale IQs obtained on 13 16-20 yr old mentally retarded adolescents during their 15th yr of age and WAIS Full Scale IQs obtained after their 16th birthday using both the 11-subtest WAIS and several abbreviated forms of the WAIS. WAIS scores were constantly higher than WISC scores. Implications for the use of these tests with retarded adolescents are discussed.—*Journal abstract*.

9898. MacDonald, James D. et al. (Nisonger Ctr, Columbus, OH) **An experimental parent-assisted treatment program for preschool language-delayed children.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 395-415.—Used parents as the primary language trainers for 6 preschool children with Down's syndrome. The program applied the environmental language intervention strategy to effect a generalized functional language in children who primarily were capable of only single-word utterances. The 5-mo program ran in 2 stages—2 mo with professionals and mothers as language trainers and 3 mo in the home with parents as the sole language trainers. Results from the 2-mo stage indicate marked increases in utterance length and grammatical complexity in imitation and conversation for all 3 experimental Ss but negligible changes for the 3 controls. Follow-up assessment indicates continued language increments for the experimental Ss over 3 mo of home programing with parents as the sole language trainers. The experimental language growth in the mean length of utterance over 3 mo of home programing for the retarded children was comparable to growth for normally developing children.—*Journal abstract*.

9899. MacMillan, Donald L.; Jones, Reginald L. & Aloia, Gregory F. (U California, Riverside) **The mentally retarded label: A theoretical analysis and review of research.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 241-261.—Reviewed literature on the effect of the mentally retarded label. Few studies were found in which labeling was isolated, thus enabling differences between labeled and unlabeled groups to be attributed to the label, per se. The evidence failed to provide support for the notion that labeling has long-lasting and devastating effects on those labeled. It is concluded that while there may be detrimental effects of labeling, the research to date does not reflect sufficient appreciation for the complexity of the dynamics of how the label operates. Factors hypothesized to alter the effect of the label are also discussed. (119 ref)—*Journal abstract*.

9900. Radlbeck, Kurt G. (Kreiskrankenhaus/Kreispoliklinik, Borna, E Germany) **[The sexual**

behavior of mentally retarded adolescents.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jun), Vol 26(6), 344-352.—Sexual experiences of 682 mental retardates were not significantly different from those of 147 normal juveniles. Heterosexual experiences were common for both sexes and cohabitation was frequently reported by retarded females.

9901. Rawson, Margaret B. **The self-concept and the cycle of growth.** *Bulletin of the Orton Society*, 1974, Vol 24, 63-76.—Presents a comprehensive discussion of E. Erickson's 8 psychosocial stages of man as they are related to general development, and their effects upon language-disordered children. For such a child Erickson's 4th stage, competence, is crucial in later development. His incompetence in cognitive skills seriously affects his identity, i.e., his self-concept; and a feeling of self-worth is important to life-long psychosocial development. (28 ref)—G. R. Alley.

9902. Roeher, Allan; Flynn, Robert; Hartnell, Frances & Harshman, Fred. (National Inst on Mental Retardation, York U, Downsview, Ontario, Canada) **Assessing the national recreation study.** *Journal of Leisureability*, 1974(Oct), Vol 1(4), 34-41.—Critiques a report entitled *Recreation Services for the Handicapped* by P. Witt by presenting the viewpoint of the Canadian National Institute on Mental Retardation (NIMR). It is stated that the report describes past and present problems and failures without analyzing them or providing proposals for the future. Deficiencies in research methodology and a lack of philosophical commitment are cited. The NIMR stresses the normalization approach in treating the retarded, an approach not stressed in the report. The NIMR also concludes that the report's suggestion of voluntary coordination of services is unrealistic and that there should be more emphasis on citizens' roles in planning services for the retarded.—C. Wright.

9903. Rowitz, Louis. (Illinois Inst for Developmental Disabilities, Chicago) **Sociological perspective on labeling: A reaction to MacMillan, Jones, and Aloia.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 265-267.—Presents a suggestion in response to D. L. MacMillan et al (see PA, Vol 53:Issue 5) that in order to develop better care programs for the mentally retarded, the work of psychologists and educators should be combined for a complete conceptual orientation to the study of labeling.

9904. Rugel, Robert. (Virginia Polytechnic Inst & State U) **The factor structure of the WISC in two populations of disabled readers.** *Journal of Learning Disabilities*, 1974(Nov), Vol 7(9), 581-585.—Factor-analyzed WISC subtest scores from 2 populations of disabled readers. Population 1, reported by G. Schiffman and R. L. Clemmens (1966), consisted of 240 public school children (mean age = 12 yrs); Population 2, reported by J. F. Beck (1955), comprised 71 children aged 9-10.11 yrs, who were referred to a university reading clinic; Population 3 was Wechsler's (1949) standardization sample of 200 males and 200 females, age 10½ yrs. Subtests included in A. Bannatyne's Spatial and Conceptual categories were each found to comprise separate factors. Subtests in Bannatyne's Sequential category, particularly Digit Span and Coding, comprised a separate factor in only 1 of the 2 populations. This

suggests that the lowered scores of disabled readers on Digit Span and Coding cannot be accounted for in terms of a single underlying short-term memory ability. It is concluded that the study provides support for regrouping the WISC into Spatial, Conceptual, and Sequential categories. (16 ref)—*Journal abstract*.

9905. Schmitz, Klaus-Wilhelm et al. [Investigations of the tryptophan metabolism in oligophrenic children: II. Vitamin-dependent enzyme patterns (B<sub>1</sub>, B<sub>2</sub>, B<sub>6</sub>) and excretion of the tryptophan metabolites kynurenine, xanthurenic acid, trigonellinamide, and N-methylpyridone.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jun), Vol 26(6), 353-357.

—Reports finding statistically significant differences between normal and oligophrenic children in vitamin-dependent patterns and in the excretion of specific metabolites. These disturbances may be significantly related to pyridine nucleotide formation. Related kynurenase activity in the liver is also being examined.

9906. Shukla, T. R. & Pershad, Dwarka. (Hosp for Mental Diseases, Postgraduate Training Ctr, Ranchi, India) **Rehabilitation of mentally retarded children.** *Indian Journal of Mental Retardation*, 1973(Jan), Vol 6(1), 28-32.—Notes that of those who visit child guidance clinics, 60% come with the problem of mental retardation (MR). Parents hope that a drug will cure their child and bring him to a normal range of intelligence. It is suggested that parents must learn to accept MR and to train the child with consistency, allowing and encouraging him to develop self-help skills when possible.

9907. Spencer, Douglas A. (Meanwood Park Hosp, Leeds, England) **The use of W.H.O. International Classification of Diseases (mental retardation) in a hospital for mentally handicapped.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 333-335.—In 1969 consultants in British hospitals for the mentally handicapped were asked to use the booklet *A Glossary of Mental Disorders* published by the General Register Office in the completion of Mental Health Inquiry Index Cards. 600 long-term mentally handicapped inpatients were classified according to the section on "mental retardation" in the glossary. The numbers of patients in each of the intellectual and etiological subdivisions of this classification were tabulated with respect to the wards in the hospital. The glossary is a useful instrument for the classification of the residents in a hospital for the mentally handicapped. The classification provides a convenient means of presenting the intellectual levels and diagnostic categories of the patients. Some of the difficulties encountered in the etiological categorization of patients are described.—*Journal summary*.

9908. Steinheiser, Rick & Guthrie, John T. (Johns Hopkins U, Kennedy Inst) **Scanning time through prose and word strings for various targets by normal and disabled readers.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 931-938.—Administered a target-scanning task to 12 10-yr-old disabled readers, 12 10-yr-olds matched for age, and 12 matched for reading level. While reading a simple 5-sentence passage, S searched for a certain type of target: words of a given category, the letter or the phoneme /ae/. All 3 groups were fastest in finding the word targets and slowest in finding the phoneme. The disabled readers were slower than the age-

matched group for all targets. It is concluded that the phonological coding occurred at different rates after graphemic and semantic coding for all 3 groups. —*Journal abstract.*

9909. Striefel, Sebastian & Eberl, Dieter. (U Kansas) **Imitation of live and videotaped models.** *Education & Training of the Mentally Retarded*, 1974(Apr), Vol 9(2), 83-88.—Compared the imitative performance of retarded children when the behaviors were presented by live vs videotaped models. Ss were 3 male and 3 female institutionalized adolescents with a mean age of 12.10 yrs and a mean IQ of 58.5. Ss were given an opportunity to respond after each behavior was modeled; each S was exposed to a variety of behaviors and to all experimental conditions. Models of different ages were used. Results show that the videotaped models exerted a great deal of control over the imitative behavior of 50% of the Ss. Such a degree of control by videotape models whose behavior was sterile and unreal suggests that, especially when behaviors were not reinforced, videotape models could be used for the economic training of populations deficient in basic social and language skills. (23 ref)—*P. O'Brien.*

9910. Tarver, Sara G. & Hallahan, Daniel P. (U Virginia) **Attention deficits in children with learning disabilities: A review.** *Journal of Learning Disabilities*, 1974(Nov), Vol 7(9), 560-569.—Reviews 21 experimental studies of attention deficits in children with learning disabilities. Included in the review are studies of distractibility, hyperactivity, impulsivity, vigilance, and intersensory integration. From the accumulated evidence, the following conclusions were drawn: (a) Children with learning disabilities exhibit more distractibility than controls on tasks involving embedded contexts (figure-ground perception tasks) and on tests of incidental vs central learning. They are not differentially distracted by other types of distractors such as flashing lights and extraneous color cues. (b) Hyperactivity of children with learning disabilities may be situational-specific, with higher levels of activity being exhibited in the structured situation. (c) Children with learning disabilities are more impulsive, i.e., less reflective, than controls. (d) Children with learning disabilities are deficient in their ability to maintain attention over prolonged periods of time. Studies of attention within a standardized testing framework are also discussed. (35 ref)—*Journal abstract.*

9911. Weller, Leonard; Costeff, Chanan; Cohen, Bernard & Rahman, Dalyah. (Bar-Ilan U, Ramat-Gan, Israel) **Social variables in the perception and acceptance of retardation.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 274-278.—In Israel, the effects of country of origin (Jews of European or Eastern descent), social class of the parents, and level of retardation of the child on parental guilt feelings, perception of the retardation, and acceptance of the child were studied. 76 mothers of retarded children were interviewed. Results show no effect for country of origin. Middle-class parents and parents of severely retarded children more accurately perceived the retardation than lower-class parents or parents whose children were less severely retarded. There were no differences by social class or level of retardation for parental guilt feelings or acceptance of the child. (24 ref)—*Journal abstract.*

9912. Welsandt, Roy F. & Meyer, Philip A. (Wisconsin State U) **Visual masking, mental age, and retardation.** *Journal of Experimental Child Psychology*, 1974(Dec), Vol 18(3), 512-519.—In a recognition task involving both forward and backward visual masking, performance of 20 mildly retarded adolescents was less accurate than that of 20 normal Ss matched for chronological age and 20 matched for mental age. It is suggested that the iconic memory impairment of retarded Ss is attributable in part to mental retardation and not simply to low mental age. (17 ref)—*Journal abstract.*

9913. Wilton, Kerl M. & Boersma, Frederic J. (U Canterbury, Christchurch, New Zealand) **Eye movements and conservation development in mildly retarded and nonretarded children.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 285-291.—Tested 30 nonretarded and 30 mildly retarded elementary-school children (mean ages = 86-123 mo) on 4 Piagetian conservation tasks (number, length, and continuous quantity solid-liquid). Eye movements were recorded during the response period for each task. Comparisons were made between nonretarded conservers and nonconservers and between mildly retarded conservers and nonconservers. Eye movements clearly differentiated conservers and nonconservers in nonretarded and, to a slightly lesser degree, mildly retarded groups. Results indicate that conservation acquisition was accompanied by 2 discernible changes in perceptual activity. Visual exploratory behavior appeared to increase and centration effects to decrease following conservation acquisition. Results are discussed in terms of Piaget's theoretical position and possible cognitive structural differences between nonretarded and mildly retarded children. (19 ref)—*Journal abstract.*

### Speech Disorders

9914. Bloodstein, Oliver. (Brooklyn Coll, City U New York) **The rules of early stuttering.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 379-394.—Analyzed samples of the speech of 6 stuttering 3-6 yr olds on the basis of a conceptual model of stuttering as tension and fragmentation in speech. It was hypothesized that while the older stutterer tends to fragment words, the early phase of stuttering is characterized chiefly by fragmentation of whole syntactic structures such as sentences, coordinate and subordinate clauses, verb phrases, noun phrases, and prepositional phrases. The young stutterer's frequent tendency to stutter on pronouns and conjunctions was related to the model. It is predicted that the loci of early stuttering will not prove to be influenced directly by word-bound factors such as initial sound, word length, or word frequency. (17 ref)—*Journal abstract.*

9915. Tsunoda, Tadanobu & Moriyama, Haruyuki. (Tokyo Medical-Dental U, Japan) **Specific patterns of cerebral dominance for various sounds in adult stutterers.** *Journal of Auditory Research*, 1972(Jul), Vol 12(3), 216-227.—Performed T. Tsunoda's cerebral dominance test (1968) and standard audiometry on 57 adult Japanese stutterers to examine the central auditory mechanism of the speech perception of stutterers. Of the 57 Ss, 11 had conductive hearing losses and 19 had sensorineural losses over 15 db, of which they were

unaware. 54.6% of the Ss showed unusual patterns of cerebral dominance: 29.6% showed dominance for vowel sounds in the left ear and for nonverbal sounds in the right ear (converse of the normal pattern); 25% showed dominance for both vowel and nonverbal sound in the same ear. Results are discussed in relation to cerebral dominance patterns of aphasics. (44 ref)—*M. B. Meikle.*

### Physical & Toxic Disorders

9916. Akesson, Hans O.; Forssman, Hans; Wahlström, Jan & Wallin, Leif. (U Göteborg, Lillhagen Hosp, Sweden) Sex chromosome aneuploidy among men in three Swedish hospitals for the mentally retarded and maladjusted. *British Journal of Psychiatry*, 1974(Oct), Vol 125, 386-389.—Performed chromosome determinations of 117 male patients in 3 hospitals for the mentally retarded and maladjusted who had a body length measurement of 180 cm or more. The finding of 13 patients with gonosomal aneuploidy was overrepresented compared with the general population and suggests that both excess X-chromosomes and Y-chromosomes may produce a predisposition for social deviant behavior in maladjusted mentally retarded persons.

9917. Andreassen, N. J. (U Iowa, Medical School) Neuropsychiatric complications in burn patients. *International Journal of Psychiatry in Medicine*, 1974(Spring), Vol 5(2), 161-171.—Compares typical and pathological reactions to burn. The former include anxiety, mild depression, fear of deformity, and a steadily decreasing pain threshold, while the latter include severe depression, severe regression, and delirium. Data from a 1-yr follow-up and data referring particularly to children are presented. (24 ref)—*Journal abstract.*

9918. Barry, S. Joseph & Larson, Vernon D. (U Oklahoma, Health Sciences Ctr, Oklahoma City) Brief-tone audiometry with normal and deaf school-age children. *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 457-464.—Tested 10 normal and 10 deaf 6-14 yr olds with cochlear losses on a brief-tone audiometric task at 500, 1000, 2000, and 4000 Hz using a modified method of limits. The normal children yielded similar values of temporal integration at all test frequencies, and the results approached closely the theoretical values anticipated on the basis of J. Zwislöck's (see PA, Vol 35:5666) theory. With the exception of the data obtained at 500 Hz, the mean values of temporal integration associated with the deaf group were only about 1/2 the magnitude of those yielded by their normal counterparts. Results conform to what is considered to be typical of the performance of a group of individuals exhibiting cochlear pathology. There was little or no overlap between the distributions of the individual values of temporal integration recorded for the normal and the deaf groups. (26 ref)—*Journal abstract.*

9919. Becerra García, O. & León Barúa, R. (U Peruana Cayetano Heredia, Lima, Peru) [Personality profile and flatulent dyspepsia.] (Span) *Revista de Neuro-psiquiatria*, 1973(Sep), Vol 36(3), 162-168.—Used the Eysenck Personality Inventory (Form B) to study the personality characteristics of 53 patients suffering from flatulent dyspepsia and 53 healthy controls matched for age, sex, and social class. Each group consisted of 16 men and 37 women 18-65 yrs old. Dyspeptic Ss showed

significantly higher neuroticism ( $p < .01$ ) and significantly lower extraversion ( $p < .001$ ) than the controls, whose scores were close to the Eysenck norms. Since the personality of neurotic and introverted individuals corresponds (according to Eysenck) to the ancient melancholic temperament described by Galen, the temperament of patients suffering from flatulent dyspepsia could be considered as melancholic. (French & German summaries) (16 ref)—*English summary.*

9920. Bennett, P. B.; Blenkarn, G. D.; Roby, J. & Youngblood, D. (Duke U, Medical Ctr) Suppression of the high pressure nervous syndrome in human deep dives by He-N<sub>2</sub>-O<sub>2</sub>. *Undersea Biomedical Research*, 1974, Vol 1(3), 221-237.—4 male Ss were compressed to 720 fsw (23 ATA) in 20 min for 1 hr breathing 5.6 N<sub>2</sub>-16.9 He ATA with .5 ATA O<sub>2</sub> (i.e., N<sub>2</sub> = 25%) and the result compared with exposures to 22.5 He-5 O<sub>2</sub> ATA or 7 ATA (200 fsw) compressed air (5.6 ATA N<sub>2</sub>). Measurements were made of EEG, tremor, psychomotor, and intellectual performance, subjective appreciation, and pulmonary function. Decompression using .8 ATA O<sub>2</sub> required 3 days. Ss were also compressed in 33 min to 1000 fsw (31 ATA) breathing N<sub>2</sub>-He-O<sub>2</sub> (5.6 ATA N<sub>2</sub>, = 18%) or He-O<sub>2</sub> or air at 200 fsw (7 ATA). Decompression took 4 days. At both depths with the trimix, N<sub>2</sub> suppressed completely the tremors noted when diving with He-O<sub>2</sub> alone. Psychomotor tests improved markedly, and the nausea and dizziness associated with high pressure nervous syndrome did not occur. Some decrement in intellectual function remained. EEG results showed little change. It is concluded that nitrogen will suppress the high pressure nervous syndrome, but the present partial pressure was too high, causing narcosis and, therefore, needs to be reduced. (30 ref)—*Journal abstract.*

9921. Brown, J. K.; Purvis, R. J.; Forfar, J. O. & Cockburn, F. (U Edinburgh, Scotland) Neurological aspects of perinatal asphyxia. *Developmental Medicine & Child Neurology*, 1974(Oct), Vol 16(5), 567-580.—Studied to a mean age of 21 mo 93 infants who had been asphyxiated at birth. 20 died and 24 had a significant handicap, the severity of which was related to muscle tone: infants with hypotonia or with hypotonia progressing to extensor hypertonus had a bad prognosis, while those with normal flexor tone had a very good prognosis. (French & German summaries)—*P. W. Fruyser.*

9922. Burnam, M. Audrey; Pennebaker, James W. & Glass, David C. (U Texas, Austin) Time consciousness, achievement striving, and the Type A coronary-prone behavior pattern. *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 76-79.—Investigated some behavioral consequences of a coronary-prone behavior pattern called Type A, which is characterized by excessive achievement striving and a sense of time urgency. Ss were 62 undergraduates who were classified by the Jenkins Activity Survey for Health Prediction. The impatient tendencies of 1 type A Ss led them to judge the lapse of 1 min sooner than non-coronary-prone Type B Ss. Results also indicate that Type As worked on a task at near maximum capacity, irrespective of the presence or absence of a time deadline. Type Bs, by contrast, exerted more effort only when the task had an explicit deadline. Both time-estimation and performance find-

ings are discussed in terms of Pattern A as a coping strategy for maintaining control over the physical and social environment.—*Journal abstract.*

9923. Caviness, W. F.; Merritt, H. Houston & Gallup, G. H. (NIH, National Inst of Neurological Diseases & Stroke, Bethesda, MD) **A survey of public attitudes toward epilepsy in 1974 with an indication of trends over the past twenty-five years.** *Epilepsia*, 1974(Dec), Vol 15(4), 523-536.—Reports data from surveys conducted at 5-yr intervals for the past 25 yrs by the American Institute of Public Opinion on attitudes toward epilepsy held by 2,682 American adults. 90-95% of those interviewed knew about epilepsy. When those familiar with epilepsy were asked if they would object to their children playing with epileptics, there was an upward trend in the percentages of respondents who had no objections (during 1949-1974, the percentages increased from 57% to 84%). A similar upward trend in the percentages of respondents who did not view epilepsy as a form of insanity was also reported. In each of the 6 surveys, the most favorable opinions were expressed by the better educated respondents. States in the eastern, midwestern, and western regions showed less prejudice than those in the southern region. (French, Spanish, & German summaries)—*Journal summary.*

9924. Chapman, Sedwell. (Guy's Hosp, Newcomen Ctr, London, England) **Sensori-motor stimulation for the young handicapped child.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 546-547.—Uses J. Piaget's developmental ideas in pointing out the restricted opportunities for sensorimotor stimulation in handicapped children. It is suggested that parents be trained to provide a special stimulation program.

9925. Collen, F. Bobbie & Soghikian, Krikor. (Kaiser-Permanente Health Education Research Ctr, Oakland, CA) **A health education library for patients.** *Health Services Reports*, 1974(May), Vol 89(3), 236-243.—Describes the operation, staffing, and use of a library for medical patients. The library is designed to help patients understand and manage their problems and as an educational resource for the community.

9926. Collignon, R. & Rondeaux, J. (U Catholique Louvain, Service de Neurologie-Neurochirurgie, Belgium) [Clinical approach to the modalities of constructional apraxia secondary to left and right hemispherical cortical lesions.] (Fren) *Acta Neurologica Belgica*, 1974(May-Jun), Vol 74(3), 137-146.—Studied the visuo-constructive functions of 40 right-handed patients with hemispheric lesions to define the type of defects characterized by the laterality of the lesion. Results are discussed in terms of previous findings. (22 ref)

9927. Craig, Thomas J. & Abeloff, Martin D. (Johns Hopkins U, Medical School) **Psychiatric symptomatology among hospitalized cancer patients.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1323-1327.—Administered a 90-item symptom checklist (SCL-90) to 30 patients admitted consecutively to an oncology research unit. More than half of the patients showed moderate to high levels of depression, and 30% had elevated levels of anxiety. Nearly 1/3 had overall symptom patterns virtually identical to those seen in patients admitted to an emergency psychiatric service. The use of this kind of self-administered symptom inventory can be

a valuable adjunct to the identification and management of psychiatric pathology in cancer patients. (30 ref)—*Journal abstract.*

9928. Davies, Lynn & Witt, Peter A. (U Ottawa, Ontario, Canada) **Camping and the handicapped in Canada.** *Journal of Leisureability*, 1974(Jul), Vol 1(3), 9-14.—Surveyed the availability of camping opportunities for handicapped children in Canada, noting the desirability and difficulties of integrating facilities for normal and handicapped children. Staffing and financial needs are cited, and the necessity for specially trained counselors in such integrated camps is stressed.

9929. Dawley, Harold H. & Wingfield, Cecil W. (VA Hosp, New Orleans, LA) **Smoking behavior among hospitalized veterans.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 14-17.—Surveyed 110 hospitalized veterans to determine how much they smoked and their attitudes toward smoking. Results are interpreted to indicate a need for treatment programs to eliminate smoking.

9930. Dietz, V.; Hillesheimer, W. & Freund, H.-J. (U Freiburg, Neurology Clinic, W Germany) **Correlation between tremor, voluntary contraction, and firing pattern of motor units in Parkinson's disease.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Aug), Vol 37(8), 927-937.—11 patients with tremor of parkinsonism showed 3 characteristics of motor unit activity—rhythmic spontaneous resting discharge, abnormally low firing rates during voluntary contraction, and consistent differences in firing pattern between small and large motor units. Smaller units discharged once per tremor beat at weak contractions but changed into bursts of 2 or 3 spikes/beat at stronger forces. Large units were later recruited and fired preferentially once per beat. It was also found that tremor was strongly influenced by the force of voluntary contraction; it was strongest at rest or during weak muscular effort and with increasing force became continuously of higher frequency and smaller amplitude. It is suggested that both changes were the consequence of increasing discharge rates of motoneurons at stronger contractions. (21 ref)—*Journal abstract.*

9931. Dikmen, Sureyya & Reitan, Ralph M. (U Wisconsin, Neuropsychology Lab) **MMPI correlates of localized cerebral lesions.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 831-840.—Administered the MMPI to 59 Ss (mean age range = 36.8-44.6 yrs) with lateralized lesions principally involving anterior or posterior cerebral areas. Results indicate that people with cerebral lesions show evidence of some degree of emotional disturbance, characterized particularly by neurotic-like manifestations. In contrast to a number of previous research reports, differential findings did not emerge in association with the location of cerebral lesions. Based on the present results as well as review of the literature, it is concluded that laterality or caudality of lesion, per se, as the criterion for group composition based upon pathoanatomical information does not have a major differential influence on MMPI variables when groups of patients with mixed lesion types, as those represented in the present sample, are considered. (26 ref)—*Journal abstract.*

9932. Dobrokhotova, T. A. & Braghina, N. N. (Ministry of Health, Scientific Research Inst of Psychiatry, Moscow, Russian SFSR) **[Functional asymmetry of the cerebral hemispheres in psychopathological cases due to brain lesions.]** (Russ) *Voprosy Psikhologii*, 1974(Mar-Apr), No 2, 95-103.—Reviews research on the differential effect on psychopathological manifestations of lesions in the 2 cerebral hemispheres. Midline lesions are accompanied by an increase or decrease in the intensity of all mental functions, while lesions in 1 hemisphere or the other lead to more differentiated disturbances. These differ also for symmetric loci in the 2 hemispheres. Disturbances of speech and speech-related functions occur most frequently with lesions in the left hemisphere, whereas right hemisphere lesions lead to problems in the perception of the environment, oneself, space, and time. With the exception of the frontal regions, lesions in the left hemisphere lead to an arousal of personality functions as well as to depressive states, whereas lesions in the right hemisphere, with the exception of the temporal regions, lead to passivity, a drop in arousal level, and inadequate emotional responses, such as euphoria or nonchalant attitudes. (English summary) (38 ref)—L. Zusne.

9933. Duane, Drake D. (Mayo Medical School, Rochester, MN) **A neurologic overview of specific language disability for the non-neurologist.** *Bulletin of the Orton Society*, 1974, Vol 24, 5-36.—Presents a comprehensive review of the literature of neurology, anatomy, linguistics, and psychology relating to language disabilities, in the following 5 sections: (a) definition; (b) functional neuroanatomy; (c) neurophysiology and neurochemistry; (d) etiologic factors; and (e) language acquisition. The directions of future research are delineated with possible implications regarding language disabilities. A model is described from which the etiology, characteristics, remediation, and philosophy of language disabilities are determined. (2½ p ref)—G. R. Alley.

9934. Field, Michael A. & Faed, Michael J. (Royal Hosp for Sick Children, Edinburgh, Scotland) **47, XYY chromosome constitution, physical growth and psychological disturbance: A case study.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Oct), Vol 15(4), 323-327.—Presents a case of a 13-yr-old male in which factors, among them an XYY chromosome constitution, may have contributed to disturbed behavior. These factors were interrelated and included rate of growth, emotional immaturity, school difficulties, and family illness. Social responses to the patient's appearance and behavior made management difficult. The patient responded in part to psychiatric and social intervention.—*Journal summary*.

9935. Gough, Harrison G. (U California, Inst of Personality Assessment & Research, Berkeley) **Personality factors related to reported severity of menstrual distress.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 59-65.—Administered the Moos Menstrual Distress Questionnaire, reporting menstrual, premenstrual, and intermenstrual reactions, to 201 women (116 undergraduates). Factor analysis of a 24 × 24 matrix (8 scales for each period) identified symptoms at menstruation as the principal component. Estimates of scores on

this criterion were attempted by means of regression, typological, and decision-tree analyses, using scales from the California Psychological Inventory and the Personal Values Abstract as predictors. Correlations between estimated and reported distress were .36 for the typology, .38 for the decision tree, and .41 for the regression equation. Although the 3 methods did not differ greatly in accuracy, they did appear to emphasize somewhat different configurations of personality variables. (23 ref)—*Journal abstract*.

9936. Gross, Mortimer D. & Wilson, William C. (U Illinois, Medical Ctr, Chicago) **Minimal brain dysfunction.** New York, NY: Brunner/Mazel, 1974. xv, 206 p. \$10.95.—Reports findings from diagnostic, neurological, psychological, and statistical evaluations of 1,056 children with minimal brain dysfunction (MBD). The natural history of MBD is examined, and a detailed description of the treatment program, case studies, and theoretical considerations related to the pathogenesis and etiology of MBD are presented. (9½ p ref)

9937. Guarniero, G. (New York U) **Experience of tactile vision.** *Perception*, 1974, Vol 3(1), 101-104.—The author, who is a doctoral candidate in philosophy and who is congenitally blind, describes his experiences during a 3-wk training course with the Tactile Vision Substitution System, undertaken to give him some access to the concept of visual space. The technique of transmitting an image picked up by a TV camera to the skin of the back is detailed, as well as the author's gradual development of the ability to "see" or interpret the sensory inputs to the somatosensory cortex. The acquisition of such skills as recognizing the orientation of straight lines, inferring familiar objects from their proximal size, differentiating between objects and "noise" (patterns of light), understanding the concept of perspective (apparent convergence of parallel lines) and of size with respect to distance, correlating distance with elevation in the "visual field," and developing the rudiments of hand-eye coordination are discussed.—B. McLean.

9938. Heinen, James R.; Stock, William A. & Tharinger, Deborah. (Old Dominion U) **Modality-specific imagery and associative learning in the deaf and hearing.** *Bulletin of the Psychonomic Society*, 1974(Nov), Vol 4(5-A), 462-464.—Previous research has shown that recall performance of blind Ss is affected by auditory, but not visual word imagery, whereas the reverse is true for sighted Ss. The present study explored the possibility of a parallel effect with deaf Ss. 14 congenitally deaf and 14 hearing high school students learned lists of paired associates that were either high visual and low auditory imagery words or vice versa. It was predicted that deaf Ss would perform similar to hearing Ss with pairs of high visual imagery but worse with materials of high auditory imagery. Results fail to demonstrate the expected interaction. Instead, performance was uniformly superior for the visual materials, and there was no significant difference between deaf and hearing Ss. Possible reasons for this outcome are discussed.—*Journal abstract*.

9939. Hécaen, H.; Goldblum, M. C.; Masure, M. C. & Ramier, A. M. (Unité de Recherches Neuropsychologiques et Neurolinguistiques, Paris, France) **[A new observation of object agnosia: Is the specific deficit for**

the visual modality one of association or of categorization?]) (Fren) *Neuropsychologia*, 1974(Oct), Vol 12(4), 447-464.—Reports the case of a 43-yr-old male with visual object agnosia, associated with pure alexia and color agnosia but with no impairment on recognition of shapes, faces, or spatial data. The S showed no sign of general intellectual deterioration, his speech was unimpaired, and his visual acuity excellent. The symptom appeared following a large occipital left lobectomy. From the results on a series of tests it is concluded that this visual agnosia is of associative type but that the basic disorder represents a specific categorization deficit for visual inputs. (German summary) (26 ref)—*English abstract*.

9940. Imperato-McGinley, Julianne; Guerrero, Luis; Gautier, Teofilo & Peterson, Ralph E. (Cornell U, Medical Coll, New York) **Steroid 5 $\alpha$ -reductase deficiency in man: An inherited form of male pseudohermaphroditism.** *Science*, 1974(Dec), Vol 186(4170), 1213-1215.—In a study of 24 male pseudohermaphrodites born with ambiguity of the external genitalia, and raised as girls, Ss showed marked virilization at puberty and unequivocally male psychosexual orientation. Biochemical evaluation revealed a marked decrease in plasma dihydrotestosterone secondary to a decrease in steroid 5 $\alpha$ -reductase activity. It is concluded that, in utero, the decrease in dihydrotestosterone resulted in incomplete masculinization of the external genitalia. Inheritance was autosomal recessive.—*Journal abstract*.

9941. Jones, Reginald L. (U California, Berkeley) **Correlates of orthopedically disabled children's school achievement and interpersonal relationships.** *Exceptional Children*, 1974(Nov), Vol 41(3), 191-192.—A study of 102 children (6-16 yr olds) shows that Ss of all degrees of mobility showed the full range of achievement, pupil-teacher relationships, and peer relationships, and both internal and external locus of control. Rated physical dependency was also statistically independent of achievement or relationships with teachers and peers.

9942. Kaplan, Bert L. & Kaplan, Theadora. (Queens Coll, City U New York) **Developmental psychology and the visually handicapped.** *Clinical Social Work Journal*, 1974(Sum), Vol 2(2), 113-119.—Presents 4 brief case histories describing blind students' behavior. All students are reported to exhibit extreme anxiety when something is expected of them. Their behavior is interpreted in the light of M. Mahler's separation-individuation concept.

9943. Keith, Ronald M. **High activity and hyperactivity.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 543-544.—Stresses the need for carefully differentiating between the 2 disorders in diagnosis.

9944. Kendall, Norman. (Temple U, Health Sciences Ctr) **The challenge of neonatal mortality in an urban hospital.** *Health Services Reports*, 1974(May), Vol 89(3), 263-266.—Compares 1960-1964 neonatal mortality rates in 1 hospital with the 1965-1969 rates, with Swedish rates in 1965, and with US rates in 1960 and 1968.

9945. Kogan, Kate L.; Tyler, Nancy & Turner, Patricia. (U Washington) **The process of interpersonal adaptation between mothers and their cerebral palsied children.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 518-527.—Studied the interaction

between mothers and their cerebral palsied children (all under 5 yrs old) in 3 play and therapy sessions held at 10-mo intervals. Affection and positive acceptance by the mother decreased gradually, especially toward children who did not walk by the end of the study. This may be an iatrogenic effect stemming from heightened optimism at the beginning of a new treatment program. (French, German, & Spanish summaries)—*P. W. Pruyser*.

9946. Korten, J. J. & Ketterings, K. (U Nijmegen, Neurological Clinic, Netherlands) **[Anthropological aspects of Parkinson's disease.]** (Germ) *Nervenarzt*, 1972(Apr), Vol 43(4), 201-205.—Presents a theoretical discussion of Parkinson's disease, its symptoms, syndromes, development, etc. The characteristics of the patients, determinant factors, manifestations and course of the disease are analyzed chiefly in terms of anthropology but also from psychological, psychiatric, and psychosomatic viewpoints.—*T. Fisher*.

9947. Koskineniemi, M. (U Helsinki, Children's Hosp, Finland) **Psychological findings in progressive myoclonus epilepsy without Lafora bodies.** *Epilepsia*, 1974(Dec), Vol 15(4), 537-545.—Administered either the WAIS, WISC, or A. Lehtovaara's version of the Stanford-Binet Intelligence Scale to 65 patients with progressive myoclonus epilepsy without Lafora bodies. 25 Ss were reevaluated after a mean of 6 yrs. Intelligence was relatively intact after this period in contrast with the patients' poor physical conditions. The estimated IQ at onset was 92 and decreased by about 10 points in 10 yrs. This diminution began before the appearance of clear clinical symptoms. Low test scores correlated significantly ( $p < .01$ ) with duration of the disease and with age. Subtests dealing with similarities, information, and comprehension were least affected; those dealing with digit span and arithmetic were most affected. The surprisingly high IQ of these patients in comparison with those having progressive myoclonus epilepsy with Lafora bodies suggests that the 2 diseases are distinct clinical and histopathological entities. (French, Spanish, & German summaries) (20 ref)—*Journal summary*.

9948. Krankenhagen, B. & Köhler, G. K. (U Bonn, Neuroclinic, W Germany) **[Alzheimer's disease.]** (Germ) *Fortschritte der Neurologie, Psychiatrie und ihrer Grenzgebiete*, 1973(Mar), Vol 41(3), 141-165.—Studied the course of Alzheimer's disease in 16 female and 5 male 46-65 yr old patients with anamneses of 4-120 mo duration prior to admission at a clinic. Ss also were examined in order to investigate the connections between pneumoencephalographic, EEG, and psychopathological findings, especially brain-electric-psychopathological correlations. Ss underwent neurological and psychopathological examinations and cerebrospinal fluid tests. Results are presented in several graphs and tables and discussed in detail. The observations and findings of the Es are described and discussed. (English summary) (1 p ref)—*T. Fisher*.

9949. Lievens, Paul. (U Louvain, Belgium) **The organic psychosyndrome of early childhood and its effects on learning.** *Journal of Learning Disabilities*, 1974(Dec), Vol 7(10), 626-631.—A psychological and pedagogic study of 22 7-12 yr old children in whom the only abnormal feature in the case history was neonatal cerebral effects, indicates that there were various

anomalies of function which caused learning deficits in 3 specific areas—inadequacy of attention, inadequacy of motor control, and inadequacy of emotional and thymic control.

9950. Maghazaji, H. I. (Baghdad U, Medical Coll, Iraq) **Psychiatric aspects of methylmercury poisoning.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Aug), Vol 37(8), 954-958.—Studied 43 patients with methylmercury poisoning. Results indicate that 74.4% of the patients showed some degree of depression; their blood levels of mercury were higher than the average values for the whole group, and considerably higher than the blood levels of the nondepressed patients. Irritability was observed in 44.2% of the patients, all except 1 of the 19 being under 30 yrs old. There was general improvement in the mental states of the patients who were hospitalized. Mercury binding compounds did not seem to have a significant effect in enhancing recovery from the depressive state. The possibility of there being 2 distinct syndromes, due to organic and inorganic mercury poisoning, is discussed.—*Journal abstract*.

9951. Martin, M. C. (Royal National Inst for the Deaf, London, England) **Critical bands in sensori-neural hearing loss.** *Scandinavian Audiology*, 1974, Vol 3(3), 133-140.—Evaluated the relative loudness of a pair of tones as compared with a 2-kHz single tone for 10 normal-hearing Ss and 10 with cochlea deafness. A loudness balancing technique was used. Deaf Ss showed a reduced loudness effect which might suggest an extensive widening of the critical band mechanism. Consideration is given to the implications of objective measurements where a much wider critical bandwidth is found in normal-hearing Ss, and to an explanation in terms of a deranged loudness function only.—*Journal abstract*.

9952. Mellan, J.; Raboch, J. & Kohlček, J. (U Karlova, Fakulta všeobecného lékařství, Prague, Czechoslovakia) **[The problem of prostatic neurosis.]** (Czech) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 112-117.—Studied 175 cases of chronic prostatitis, using a directed interview and 2 questionnaires. A significant relation was found between concomitant sexual disorders and high neuroticism and low dominance. The patients generally came from socially weaker families and were laborers working under bad climatic conditions. Half of them reported objective difficulties in their marital life. Complaints about lack of understanding shown by their wives were common. Findings confirm the experience of psychosomatic medicine that physical symptoms are more frequent in patients with low education, while mental difficulties predominate among university students. (Russian & English summaries)—*V. Fischmann*.

9953. Merskey, H. (National Hosp for Nervous Diseases, London, England) **A case of multiple tics with vocalisation (partial syndrome of Gilles de la Tourette) and XYY karyotype.** *British Journal of Psychiatry*, 1974(Dec), Vol 125, 593-594.—Reports the case of a 19-yr-old male with XYY sex chromosomes who suffered from Gilles de la Tourette syndrome with vocalization. The occurrence of multiple tics and vocalization in this patient strongly suggests that the extra chromosome promotes neurological abnormality.

9954. Metzke, Hermann. (Universitäts-Kinderklinik, Halle/Saale, E Germany) **[Intrafamilial similarity and interfamilial differences in the course of diffuse infantile familial brain sclerosis (Type Krabbe).]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jun), Vol 26(6), 364-368.—Reports a striking uniformity in the intrafamilial course of a fatal degenerative brain disease in children. Positive diagnosis of diffuse infantile brain sclerosis can be made at birth, and death seems certain within the 1st 2 yrs of life. Siblings born within a short time seem to inherit the same disease and also die in infancy. Positive diagnosis is made through pneumoencephalograms even before a generalized hydrocephalic condition develops.—*K. J. Hariman*.

9955. Moore, W. H. & Weidner, William E. (Auburn U) **Bilateral tachistoscopic word perception in aphasic and normal subjects.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 1003-1011.—Examined the role of the right cerebral hemisphere in linguistic perception following left cerebral insult which produced aphasia. Bilateral tachistoscopic procedures, employing a central fixation mark, were utilized to investigate the visual half-field preferences of 30 aphasic Ss, grouped relative to the amount of time since the onset of left cerebral insult, and a group of 10 normal, control Ss. Statistical analyses indicated a significant left visual half-field preference for the aphasic Ss. In contrast, a significant right visual half-field preference was revealed for the normal group. (46 ref)—*Journal abstract*.

9956. Orbach, Charles E. (Westfield Massachusetts Mental Health Clinic) **Ideas of contamination in postoperative colostomy patients.** *Psychoanalytic Review*, 1974(Sum), Vol 61(2), 269-282.—Discusses ideas of contamination reported in men and women having colostomies. Rituals of cleanliness control are performed to prevent contamination. Anxiety about contamination appears primarily during irrigation and relates to the toxic poisoning of their own body interiors, the exterior of the body, and the immediate surroundings. Historically, contamination ideas have been related to sexual anxieties, but case material presented extends the anxiety to anal and oral functions.—*B. Smith*.

9957. Owen, David R.; Baker, Eugene A. & Oikawa, Kiyoshi. (Brooklyn Coll, City U New York) **Search for 47, XYY among emotionally disturbed boys.** *Behavior Genetics*, 1974(Dec), Vol 4(4), 411-413.—Cytogenetic examinations of 55 "tall," emotionally disturbed, culturally disadvantaged 5-14 yr old boys failed to reveal any chromosome anomalies.

9958. Palmblad, Jan et al. **Stressor exposure and human interferon production. Reports from the Laboratory for Clinical Stress Research**, 1974(Apr), No 35, 8 p.—8 women conducted a 77-hr vigil with performance on an electronic rifle range, interrupted by 15-min periods for answering questionnaires and for physical maintenance. The experiment continued for the 3 days without any rest or sleep and with a ban on stimulants or smoking. Blood and urine sampling suggested hormonal changes compatible with a stress reaction. Interferon production induced by adding Sendai virus to blood rose during the stress exposures, suggesting that in man as in lower animals psychosocial stimuli may affect the ability of certain cells to produce

interferon. It is suggested that stress may play a part in the complex defense system against viral infections.—*R. L. Sulzer.*

9959. **Pasquinucci, Paolo J.** (U Florence, Medical School, Inst of Psychology, Italy) [**Amenorrhea of psychosomatic nature: A clinical-psychological study.**] (Ital) *Medicina Psicomatica*, 1972(Oct), Vol 17(4), 325-351.—Interviewed 14 Ss affected by psychogenic amenorrhea and administered the Rorschach test and the MMPI. Study of the results indicates that amenorrhea must be considered in a broad perspective. Treatment must include analysis of the self-image and restructuring of the whole personality. (English & French summaries) (29 ref)

9960. **Patterson, C. D.; Erdberg, Philip & Stofac, Robert.** (U Missouri, Medical School, Inst of Psychiatry, St Louis) **Psychiatric and MMPI studies of patients with foveomacular retinitis.** *Military Medicine*, 1974(Dec), Vol 139(12), 972-977.—Studied, through psychiatric interviews and MMPIs, 10 consecutive male military patients with foveomacular retinitis (FMR). The psychiatric interviews revealed considerable premorbid maladjustments in their school, family, and military life and a high degree of premorbid emotional stress. The MMPIs were analyzed alone, compared with a normal group of MMPIs, and finally compared with an inpatient psychiatric groups' MMPIs. The analysis of the FMR MMPIs showed them to be clearly pathologic. The comparison between the FMR and normal MMPIs indicated the former to have significantly more pathological findings on every clinical scale, and to appear very similar to the group of inpatient psychiatric MMPIs.—*Journal abstract.*

9961. **Pech, Karel.** (U Prague, Czechoslovakia) **Psychological factors in cancer.** *International Mental Health Research Newsletter*, 1974(Sum), Vol 16(2), 1, 12.—Hypothesizes that growing entropy, or increasing disorder in the life of the individual, is a major determinant of cancer. Referring to earlier findings that cancer victims have often experienced traumatic and lasting life changes, the argument describes how the body's resistance to outside influences decreases progressively after birth, and if the severity or number of changes exceeds the individual's tolerance, a defensive reaction may take place in the form of tissue growth for which the body no longer has effective control mechanisms. Several specific types of crucial changes occurring between the ages of 40 and 50 are described.—*C. A. Heikkinen.*

9962. **Perino, Joseph & Ernhart, Claire B.** (Half Hollow Hills Public Schools, Dix Hills, NY) **The relation of subclinical lead level to cognitive and sensorimotor impairment in black preschoolers.** *Journal of Learning Disabilities*, 1974(Dec), Vol 7(10), 616-620.—Studied 80 3-5 yr old black preschool children to determine the relation of blood lead levels to cognitive and perceptual-performance functioning. Results show that Ss' lead levels were below the criteria set for lead poisoning, but a regression formula revealed that the relationship was significant, and as lead level increased general cognitive, verbal, and perceptual abilities decreased. Lead levels were not related significantly to parental intelligence, birth order, birth weight, and number of siblings. It was, however, related to the educational level of the parents.

It is concluded that the criteria set for lead poisoning warrant reexamination. (15 ref)—*Journal abstract.*

9963. **Peuser, G. & Leischner, A.** (Rheinische Landes-klinik für Sprachgestörte, Bonn, W Germany) [**Disturbance of phonetic writing in an aphasic patient.**] (Germ) *Neuropsychologia*, 1974(Oct), Vol 12(4), 557-560.—Results of testing a male philologist with sensory-amnesic aphasia show that, although both the S's normal orthographic and phonetic transcriptions of dictation were affected by his disorder, the phonetic transcription was superior to the orthographic. It is inferred that the S's receptive defect was due to faulty semantic rather than phonetic decoding.

9964. **Polzien, P. & Roggenkämper, R.** (Medizinische Universitäts-Poliklinik Würzburg, W Germany) [**An approach to somatic analysis of neuroses: Urinary excretion of vanillin-mandelic acid under stress in patients with high neuroticism.**] (Germ) *Nervenarzt*, 1972(Jun), Vol 43(6), 305-308.—Administered 2 versions of Maudsley-Eysenck inventories to 24 male and 7 female patients with medical indications for biopsy of the liver (blind puncture). Rectal temperatures and urine samples were obtained hourly starting at noon (8 hrs before biopsy) and continuing until 24 hrs after biopsy. Excretion of vanillin-mandelic acid (VMA) for 24 hrs correlated positively with basal metabolic rate. Sex differences in VMA excretion exist, but VMA excretion relative to basal metabolic rate did not vary with sex. Body temperature and VMA excretion per minute were correlated. Before biopsy (stress), highly neurotic Ss excreted more VMA than "normally" neurotic Ss. After biopsy, the mean increase in VMA excretion was 28% among the highly neurotic Ss, and 87% in the normal Ss. Elevated VMA excretion persisted during the night in the highly neurotic Ss. It is suggested that increased VMA excretion may correlate with anxious expectation.—*J. Rutschmann.*

9965. **Pulos, Steven M.; Wollitzer, Alison O. & Vitale, John H.** (York U, Downsview, Ontario, Canada) **Body image alterations in adults due to cerebrovascular insufficiency.** *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 540-546.—Studied changes in body-image boundary in 81 male patients (mean age—63 yrs) with cerebrovascular insufficiency having varying degrees and sites of impairment. Barrier and Penetration scores were derived from the Rorschach Test according to the S. Fisher and S. E. Cleveland (1968) technique and were correlated with several indices of impairment and analyzed for changes over a 2-yr period. Penetration scores were associated with 3 measures of intellectual ability, including WAIS scores. Barrier scores were correlated with verbal ability and vertebrobasilar angiogram. Barrier changed over time with a quadratic trend, while Penetration did not change. (29 ref)—*Journal abstract.*

9966. **Remschmidt, H.** (Phillips U Marburg, Psychiatric Clinic for Children & Juveniles, W Germany) [**Prejudices towards epileptics.**] (Germ) *Nervenarzt*, 1972(Apr), Vol 43(4), 197-200.—Studied hetero-stereotypes towards epileptics in 300 Ss from different strata of the population and auto-stereotypes in 53 epileptic patients. The discrimination scores of Ss were computed on the basis of data obtained by a 55-item, 5-step scale

list of adjectives divided into 3 categories—positive, negative, and neutral—but listed in random sequence. The questionnaire was tested for consistency by item and cluster analysis and produced high reliability coefficients. Results indicate that (a) most of the 300 Ss had negative prejudices, scored high on negative qualities and very low on positive ones; (b) the self-reports of the 53 epileptic Ss revealed much more favorable and positive attitudes and higher scores on positive qualities; and (c) the difference between hetero- and auto-stereotypes manifested itself significantly in regard to positive ( $p = .05$ ) and negative ( $p = .01$ ) qualities, while there was no difference in regard to the neutral ones. (17 ref) —T. Fisher.

9967. Robbins, Paul R.; Meyersburg, Herman A. & Tanck, Roland H. (George Washington U, Medical School) **Interpersonal stress and physical complaints.** *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 578-585.—Studied the relationship between a measure of interpersonal stress and report of physical symptoms in 85 undergraduates who kept a structured diary for 1 wk. A positive relationship was found between the diary measure of interpersonal stress and an overall tendency to report physical complaints. Positive relationships were also found between the measure of interpersonal stress and report of specific symptoms (e.g., dizziness and back problems). Interpersonal stress appeared higher on symptom days than nonsymptom days, but little evidence was found for higher stress on days immediately preceding symptoms.—*Journal abstract*.

9968. Rodda, Michael. (Dept of Health & Social Security, London, England) **Behavioral disorders in deaf clients.** *Journal of Rehabilitation of the Deaf*, 1974(Apr), Vol 7(4), 1-13.—Describes experiences in working with a rehabilitation program for deaf clients and discusses the etiology, classification, and remediation of behavioral problems with deaf adolescents and young adults.

9969. Rosner, Fred. (Long Island Jewish—Hillside Medical Ctr, Queens Hosp Ctr, NY) **Emotional care of cancer patient: To tell or not to tell.** *New York State Journal of Medicine*, 1974(Jul), Vol 74(8), 1467-1469.—Discusses psychological and ethical considerations involved in informing the terminally ill cancer patient about his disease. It is suggested that the patient should be informed of the nature of his illness unless the physician and family decide that frankness would cause the patient physical or mental harm.

9970. Satterfield, James H.; Cantwell, Dennis P. & Satterfield, Breana T. (Gateways Hosp, Los Angeles, CA) **Pathophysiology of the hyperactive child syndrome.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 839-844.—Presents results from 4 previously reported studies of 6-9 yr old boys which suggest that some hyperactive children may be characterized as having a low central nervous system (CNS) arousal level. Evidence from animal and human neurophysiological studies suggests that this low arousal level may be accompanied by low levels of inhibition in the CNS. A neurophysiological model of low CNS arousal and inhibition explains in part the hyperactive child's disorganized and disruptive behavior. The essence of this model is lack of inner controls over motor output and sensory input, resulting in behavioral and learning

problems. Stimulant medications are viewed as restoring both CNS arousal and inhibitory levels to normal, providing the child with better controls and permitting a wider range of behavioral patterns. (57 ref)—*Journal abstract*.

9971. Schachter, Joseph; Kerr, Joyce L.; Wimberly, Francis C. & Lachin, John M. (U Pittsburgh, Medical School) **Heart rate levels of black and white newborns.** *Psychosomatic Medicine*, 1974(Nov-Dec), Vol 36(6), 513-524.—Suggests that the higher heart-rate levels found among 78 black newborns (compared to 68 white newborns) may be a precursor of hypertensive disease. (79 ref)

9972. Schwartz, Ellen R. (Children's Hosp of Philadelphia, PA) **Characteristics of speech and language development in the child with myelomeningocele and hydrocephalus.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 465-468.—Notes that children with myelomeningocele and shunted hydrocephalus typically acquire language normally but also develop a characteristic language usage that has been labeled "cocktail party speech." This pattern is described and some explanations of its decreasing occurrence are proposed. The speech clinician's role in managing the child with myelomeningocele and hydrocephalus is described.—*Journal abstract*.

9973. Segers, M. J.; Graulich, P. & Mertens, C. (U Louvain, Belgium) **[Psycho-bioclinal relationships in a group of coronary patients: Preliminary study.]** (Fren) *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 307-313.—Of 1,695 males who volunteered for a coronary heart disease (CHD) screening test, 176 showed clinical or EKG symptoms of coronary disease. Comparisons were made on the Anxiety Scale of the Institute for Personality and Attitude Testing and on the Zung Depression Scale, and the CHD bioclinal risk factors were compared for (a) the coronary patients and the whole sample, (b) the younger and older Ss in the coronary sample, and (c) Ss who had previously seen a doctor about their cardiac complaints and those who had not. Significant differences appeared between the groups for psychological but not physical variables. Ss with coronary symptoms had more overt and covert anxiety. Those who had seen a physician about their symptoms were more depressed and anxious than those who had not. Diastolic blood pressure correlated significantly with anxiety measures among the coronary Ss.—W. G. Shipman.

9974. Shallice, Tim & Warrington, Elizabeth K. (National Hosp, London, England) **The dissociation between short term retention of meaningful sounds and verbal material.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 553-555.—2 patients (30 and 36 yrs old, respectively) with a specific deficit of auditory verbal short-term memory were tested on 2 tasks of short-term retention, one involving verbal material—letters—and the other nonverbal material—meaningful sounds. 10 extracerebral-lesioned patients served as matched controls. There was a striking dissociation between Ss' performance on the 2 tasks, only their performance on the verbal tasks being impaired. Results are discussed in the context of the function of this short-term memory system. (French & German summaries)—*Journal abstract*.

9975. Simpson, Michael T. et al. (Medical Coll Georgia, Augusta) **Exercise-induced catecholamines and platelet aggregation in the coronary-prone behavior pattern.** *Psychosomatic Medicine*, 1974(Nov-Dec), Vol 36(6), 476-487.—Studied catecholamines and platelet aggregation in relation to physical fitness and psychological traits of 48 male college students at rest and after exercise challenge. Test scores were significantly associated with variables derived from the in vitro reactivity of blood platelets. Men characterized by high time urgency, impatience, haste, and irritability had higher platelet counts in their whole blood. They also had less of a decrease in percent of platelet aggregation in response to noradrenaline after exercise, a shorter duration of platelet aggregation time in response to adenosine diphosphate (ADP), and a greater likelihood of irreversible "2nd slope" aggregation than the less hurried, more calm men. Men scoring high on C. Jenkins's (1969) Type A or coronary-prone behavior scale also failed to show a decrease in percent of platelet aggregation in response to noradrenaline after the challenge of exercise. In addition, the duration of the aggregation to ADP was much shorter in Type A's at rest and relatively unaffected by exercise. (20 ref)—*Journal abstract*.

9976. Sipos, Jörg & Tägert, Jochen. (Hannover U of Medicine, Neurological Clinic, W Germany) [Short procedure for the diagnosis of aphasic disturbances.] (Germ) *Nervenarzt*, 1972(Apr), Vol 43(4), 207-211.—Discusses the Token-Test of De Renzi, Vignolo, and Boller for diagnosing aphasic disturbances (left-side brain lesions) and reports on the use of a shortened version administered to 28 patients with left-side lesions, 28 with right-side lesions, 3 with diffuse brain atrophies, and 31 healthy controls. The goal of the investigation was to supplement the routine topical diagnostic examination of organic brain diseases by tests of psychic functions. The short test can be given by personnel without any medical training and takes only a few minutes. The methods and results of the experiment are described in detail. It is believed that the test could be of great value in selecting aphasics for rehabilitation treatment, in controlling the course of treatment, and in evaluating methods of treating cerebral diseases.—*T. Fisher*.

9977. Speiser, Abraham M. (Fairleigh Dickinson U, School of Dentistry) **Another culture, another time.** *Journal of the American Geriatrics Society*, 1974(Dec), Vol 22(12), 551-552.—3 experiences with geriatric Navajo Indians are presented. They illustrate cultural and physical differences which affected dental and other treatment.

9978. Spinetta, John J.; Rigler, David & Karon, Myron. (San Diego State U) **Personal space as a measure of a dying child's sense of isolation.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 751-756.—Used interpersonal distance measures to objectify the sense of isolation said to be present in a child with fatal illness as he nears death. When asked to place each of 4 significant figures (nurse, doctor, mother, father) at their usual place in a 3-dimensional hospital-room replica, 25 6-10 yr old leukemic children placed the figures at a distance significantly greater than did the matched control group of 25 chronically ill hospitalized children. Although the distance of placement increased

with both groups in subsequent admissions, the leukemic children increased the distance significantly more than did the chronically ill, lending strong support to the hypothesis that the sense of isolation grows stronger as the child nears death. A final placement of preferred distance leads to the conclusion that the 6-10 yr old fatally ill child not only perceives a growing psychological distance from those around him but for whatever reason prefers it that way. (22 ref)—*Journal abstract*.

9979. Strupp, Hans H. et al. **Effects of suggestion on total respiratory resistance in mild asthmatics.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 337-346.—Gave 13 mild asthmatics inhalations of saline—described as either a neutral substance or a bronchoconstrictor—and Isuprel (isoproterenol)—described as either a bronchodilator or a bronchoconstrictor. Measurements of total respiratory resistance were taken before and after each inhalation. All suggestions except saline-neutral had a significant effect on the 1st inhalation. Analysis of individual data revealed 2 groups: reactors and nonreactors.—*W. G. Shipman*.

9980. Tew, Brian; Laurence, K. M. & Samuel, P. (Welsh National School of Medicine, Heath Park, Cardiff) **Parental estimates of the intelligence of their physically handicapped child.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 494-500.—Converted parents' estimates of the intelligence of 57 spina bifida children 9-15 yrs old into IQ scores and 53:Issue 5) them against obtained WISC scores. Parents tended to slightly overestimate their children's intelligence; considerable distortion occurred in the 60-80 IQ range. (French & German summaries) (28 ref)—*P. W. Pruyser*.

9981. Tew, Brian; Payne, Helly; Laurence, K. M. & Rawnsley, K. (Welsh National School of Medicine, Heath Park, Cardiff) **Psychological testing: Reactions of parents of physically handicapped and normal children.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 501-506.—Studied reaction of Cardiff parents to testing of a group of 56 spina bifida children (see PA, Vol 53:Issue 5) and a control group of 56 normal children matched for sex, social class, family size, and area of residence. Parents of the handicapped children significantly distorted the test results in the direction of normality, especially for children in the 60-80 IQ range. (French, German, & Spanish summaries)—*P. W. Pruyser*.

9982. Warrington, Elizabeth K. & Weiskrantz, L. (National Hosp, London, England) **The effect of prior learning on subsequent retention in amnesic patients.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 419-428.—Conducted 5 experiments in which the properties and limits of cued recall were explored in 4 58-64 yr old amnesics. Certain qualitative differences in the performance of amnesic Ss compared with a total of 41 extracerebral-lesioned matched controls were obtained. First, the phenomenon of differential efficacy of cued recall in amnesic Ss was replicated. Second, restricting the number of response alternatives was more effective in amnesic than normal Ss. Third, some evidence for enhanced effects of prior learning on retention was shown in amnesic Ss. Findings are incompatible with an interpretation in terms of a failure of consolidation, but are compatible with one that attaches importance to

interference phenomena in the amnesic syndrome. (French & German summaries)—*Journal abstract*.

9983. Wax, Douglas E. (U Michigan, Medical School) **Clinical-medical issues for the health professional who is also a leukemic.** *International Journal of Psychiatry in Medicine*, 1974(Spr), Vol 5(2), 135-141.—Discusses the fact that the health professional is in a unique but often awkward role when he falls victim to life-threatening illness and becomes a patient. Accustomed to the role of caretaker, he experiences an abrupt role reversal accompanied by depression, loss of self-esteem, and the continual operation of defenses designed to protect himself in a period of acute distress. Personal experience is used as the starting point for a discussion of these and allied psychological issues concerning patient care in general.—*Journal abstract*.

## TREATMENT AND PREVENTION

9984. Banerji, B. S. **Prevention of mental retardation.** *Indian Journal of Mental Retardation*, 1973(Jan), Vol 6(1), 33-42.—Reports that there are almost 16½ million mentally retarded (MR) persons in India, 3,500 institutionalized in 68 institutions. It is recommended that MR be in part prevented by (a) early testing and treatment for phenylketonuria, (b) prevention of prenatal infections, (c) professional assistance (e.g., from a midwife) at time of delivery of infant, and (d) family planning to reduce family size. Preventive measures must be directed toward the Indians who live in small villages and constitute most of the population.—*J. H. Pflaum*.

9985. Bankston, William B. & Cramer, James A. (U New Orleans) **Toward a macro-sociological interpretation of general deterrence.** *Criminology: An Interdisciplinary Journal*, 1974(Nov), Vol 12(3), 251-280.—Noting that there is little systematic theoretical and empirical knowledge about general deterrence, an attempt was made to integrate existing literature into a set of testable hypotheses. 3 perspectives on general deterrence are examined, including the classical school of criminology and the positions of E. Durkheim (1964) and W. Sumner (1940). The variables of certainty and severity, type of threatened behavior, latent deterrent functions of legal threats, and normative structure are discussed. It is suggested that compliance rates may be used as an empirical index of general deterrence. (72 ref)—*Journal abstract*.

9986. Boudewyns, Patrick A. & Borkovec, Thomas D. (VA Hosp, Iowa City, IA) **Credibility of psychotherapy and placebo therapy rationales.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 15-18.—Obtained from 120 psychiatric inpatients ratings of the credibility and promise of improvement of 5 types of therapy. Significant differences in the ratings were found. Psychoanalysis and drug therapy were generally rated higher than implosive therapy, attention-placebo, and desensitization, which are less well known.

9987. Carpenter, James O. & Wylie, Charles M. (U Michigan, School of Public Health) **On aging, dying, and denying: Delivering care to older dying patients.** *Public Health Reports*, 1974(Sep-Oct), Vol 89(5), 403-407.—Discusses the improvement of health care for older,

dying people. The effects of social climate, bereavement, and hospitalization are presented. It is recommended that comprehensive humane health care should be provided the elderly even if this cannot be justified by a cost-benefit analysis.

9988. Davis, William E.; Dehnel, Luther L. & Kremer, Patricia M. (VA Hosp, St Cloud, MN) **Outcome research comparing brief treatment with unlimited treatment: A pilot study.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 10-11.—Tested the relative effectiveness of brief vs long-term treatment with 2 matched groups of patients. Readmission percentages were the same in both groups, indicating that brief treatment is effective with a wide range of patient types.

9989. de Oliveira Queiroz, Amaury. [Thoughts about psychosomatic medicine.] (Port) *Jornal Brasileiro de Psiquiatria*, 1972(Jan), Vol 21(1), 163-169.—Reviews historical antecedents of psychosomatic medicine. Broader medical training in this field, and the incorporation of psychiatry within general hospital services, are recommended for Brazil.

9990. Heyes, Anthony D. (U Nottingham, Blind Mobility Research Unit, England) **Blindness and yoga.** *New Outlook for the Blind*, 1974(Nov), Vol 68(9), 385-393.—Presents evidence from the literature to highlight 2 aspects of blindness—physical inactivity leading to poor physical fitness, and the state of anxiety which accompanies unguided blind mobility. Evidence is further presented to show that physical fitness may be achieved painlessly by means of Hatha Yoga and that anxiety may be reduced and the lasting effects of anxiety moderated by the practice of meditation. It is the author's suggestion that, given these 2 findings, it would be appropriate to encourage blind people in Yogic practices. An attempt is made, on behalf of the blind population, to extract from the storehouse of Yogic knowledge those aspects which are likely to be beneficial—an application of pragmatic eclecticism. (21 ref)—*Journal abstract*.

9991. Hirsch, Sherry et al (Eds.). **Madness Network News reader.** San Francisco, CA: Glide, 1974. 192 p. \$5.95.—Includes articles, poems, graphics, and letters on issues surrounding mental health, (e.g., treatments used for mental patients and the movement to change the system of treating these patients). (165 ref)

9992. Hogarty, Gerard E. et al. (U Pittsburgh, Medical School) **Drug and sociotherapy in the aftercare of schizophrenic patients: III. Adjustment of nonrelapsed patients.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 609-618.—Examined the effects of chlorpromazine and major role therapy (MRT) on the quality of community adjustment of 374 18-55 yr old schizophrenic patients during a 2-yr period following hospital discharge. Among patients in the community, those treated with combined drug and sociotherapy adjusted better than those taking the drug alone; to a greater extent, those receiving placebo alone adjusted better than those receiving placebo and sociotherapy. However, only 20% of those in the placebo group had not relapsed after 2 yrs while the comparable percentage for the drug group was 52%. Effects found on assessments made by psychiatrists, social workers, family ratings, and self-reports

were replicated at 3 clinics. It is concluded that maximum restorative benefits require both maintenance phenothiazine and psychologic treatment beyond a single year following hospital discharge.—*Journal abstract.*

9993. Hogarty, Gerard E. et al. (U Pittsburgh, Medical School) **Drug and sociotherapy in the aftercare of schizophrenic patients: II. Two-year relapse rates.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 603-608.—Examined the effects of maintenance chlorpromazine and major role therapy (MRT) in forestalling the relapse of 374 schizophrenic patients recently discharged from the hospital. Chlorpromazine was significantly more effective than placebo in forestalling relapses ( $P < .001$ ). By 24 mo, 80% of placebo-treated patients relapsed compared to 48% of those drug-treated. Further, although drug therapy was more effective than placebo in both sexes, the size of the difference was significantly greater for women than men. There was no sex difference with placebo treatment. There was no significant effect of MRT during the entire treatment period. However, MRT did reduce relapses among those who survive in the community for 6 mo after hospital discharge. Results were replicated at 3 clinics.—*Journal abstract.*

9994. Korbar, Ksenija. (Vrapče Psychiatric Hosp, Zagreb, Yugoslavia) [Some forensic aspects of social psychiatry.] (Srscr) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(3), 67-73.

9995. Levinson, Peritz. (Mount Sinai School of Medicine, City U New York) **Obstacles in the treatment of dying patients.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 28-32.—Reviews the literature, showing that theory and practice in the management of the dying patient have moved forward in the past 2 decades. However, it is believed that the benefits of this progress have not reached a large segment of the population of dying patients—those individuals who have a higher level of psychopathology or are from a lower socioeconomic group. Obstacles in the treatment of such patients are illustrated by 4 case histories. Specific recommendations related to the care of these more difficult cases are presented. (22 ref)—*Journal abstract.*

9996. Nias, D. K. & Shapiro, M. B. (Inst of Psychiatry, U London, England) **The effects of small electrical currents upon depressive symptoms.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 414-415.—Conducted 2 20-trial experiments with 2 depressed male patients using 400 and 500  $\mu$ A in negative current and placebo conditions. Results suggest that small direct currents passed through the brain have temporary effects on depressive symptomatology.

9997. Rabin, Albert I. (Ed.). (Michigan State U) **Clinical psychology: Issues of the seventies.** East Lansing, MI: Michigan State University Press, 1974. xi, 243 p. \$10.—Presents a collection of 16 essays on broad issues in clinical psychology (e.g., the relationship between assessment and therapy, psychology and the law); roles, models, and settings of the practicing clinician; recent psychotherapeutic approaches and innovations; and issues in the training of future clinical psychologists.

9998. Sharfstein, Steven S.; Taube, Carl A. & Goldberg, Irving D. (NIMH, Alcohol, Drug Abuse, & Mental Health Administration, Rockville, MD) **Private psychiatry and accountability: A response to the APA task force report on private practice.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 43-47.—Notes that the imminence of national health insurance makes it very important to determine the roles, efficiency, and effectiveness of both the private and the public sectors of mental health care. The difficulties in distinguishing public from private care are examined. Estimated distributions of care by type of provider are presented that differ from those of an American Psychiatric Association task force report on private practice. The need for objective research on the quality of care in both sectors and on the effectiveness of alternative mental health systems is noted, and it is suggested that public choices should be made on the basis of correct interpretations of reliable data and accountability to those being served. (21 ref)—*Journal abstract.*

9999. Śluta, Jerzy. (Jagiellonian U, Psychological Inst, Cracow, Poland) [Problems of memory disorders caused by electroconvulsive treatment.] (Polh) *Przegląd Psychologiczny*, 1973, Vol 16(1), 29-48.

10000. Waxler, Nancy E. (Harvard U, Medical School, Boston) **Culture and mental illness: A social labeling perspective.** *Journal of Nervous & Mental Disease*, 1974(Dec), Vol 159(6), 379-395.—Observations made by the author in Ceylon and by other practitioners in Africa suggest that the serious psychoses seen in these peasant systems are of short duration with an excellent prognosis. Data from a study that followed treated schizophrenics in Mauritius are reviewed which show that clinical symptoms and social performance after 12 yrs were significantly better than a comparable group of patients in Great Britain even though the Mauritian treatment was more limited. Several theories which have been developed to explain cross-cultural variations in types, rates, and outcomes of mental illness are examined. An alternate theory is proposed which argues that societies do not cause different rates of mental disorder or tolerate varying degrees of deviance; instead they respond differently to illness once it occurs. Differences in societal response, in turn, account for differences in rates and outcome. The social labeling theory of deviance is used to present concepts and hypotheses to explain how different societies mold the mentally ill person to match societal expectations. The role of belief systems of the society in this process is emphasized. (35 ref)—*Journal abstract.*

10001. Winkelman, N. William & Saul, Steven D. (Private practice, Philadelphia, PA) **The return of suggestion.** *Psychiatric Quarterly*, 1974, Vol 48(2), 230-238.—Discusses the use of suggestion in general medicine and contemporary psychotherapies. Considered an outmoded form of treatment at the end of the 19th century, suggestion is now used in community mental health centers. These centers dispense brief therapy, help, and advice to large portions of the population previously considered unreachable. (29 ref)—*Journal abstract.*

# Psychotherapy & Psychotherapeutic Processes

10002. Arazo, Daniel L. Marital transference. *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 55-63.—Suggests that marital transference embraces the unconscious elements in the marriage itself and in the process of marital therapy. In marriage, transference distortions have developmental or perceptual origins. In the former, a distinction must be made between character object relations (COR) and symptom object relations (SOR). COR implies deep pathology in both spouses, whereas SOR suggests neurotic interaction at one level of the 2 personalities. The perceptually originated distortions have reification as a common element. The ambivalence of the wife as a person and as a symbol is rejected so that the husband identifies with the ideal to which the wife or the marriage must conform. In the process of marital therapy, the distortions of the therapist also must be given special attention. (Spanish & French abstracts) (22 ref)—*Journal abstract*.

10003. Bach, George R. (Inst of Group Psychotherapy, Los Angeles, CA) **Creative exits: Fight-therapy for divorcees.** In V. Franks & V. Burt (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10005. Bernstein, Douglas A. (Western Washington State Coll) **Manipulation of avoidance behavior as a function of increased or decreased demand on repeated behavioral tests.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 896-900.—5 groups of 15 female undergraduates reporting fear of snakes participated in 2 behavioral avoidance tests employing a snake as the target object. 4 groups were first tested under low demand for approach and then under the same conditions or under 1 of 3 conditions of demand increase, mediated by instructions, mode of administration, or both. The 5th group was tested under high, then low demand. Ss first tested under low demand showed significantly more fear than those first tested under high demand. In addition, Ss in the demand-increase groups showed significant increases in approach at the 2nd behavior avoidance test, while Ss in the demand-decrease group showed a significant reduction in approach. Ss in the repeated-measure control group showed no significant changes. (16 ref)—*Journal abstract*.

10006. Berzins, Juris I.; Bednar, Richard L. & Severy, Lawrence J. (U Kentucky) **The problems of intersource consensus in measuring therapeutic outcomes: New data and multivariate perspectives.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 10-19.—Contrasted the results yielded by several multivariate techniques (component analysis, canonical correlation, typological analysis) to examine intersource agreement and disagreement in a nationwide sample of 79 therapist-patient dyads across pre-post data (converted to residualized gain scores) generated by patients, therapists, and psychometrists on a total of 22 measures (e.g., MMPI Current Adjustment Rating Scale, and Psychiatric Status Schedule). 4 factors emerged from a principal compo-

nents analysis—changes in (a) patient-experienced distress, (b) observable maladjustment, (c) impulse expression, and (d) self-acceptance. It is suggested that large-scale collaborative studies are needed to clarify further the types of intersource agreement and disagreement isolated in this study. The development of consensual measures of outcome is imperative for the systematic evaluation of the effects of diverse therapeutic interventions. (26 ref) self-acceptance. (26 ref)—*Journal abstract*.

10007. Betensky, Mala. **Patterns of visual expression in art psychotherapy.** *Art Psychotherapy*, 1973(Fal), Vol 1(2), 121-129.—Describes the identification of cues and tracing of patterns in art work by patients in art psychotherapy. Patients choose their medium for spontaneous line drawings and also the size of the paper. Drawings are evaluated according to overall pattern, which may change characteristically over time, and persistent details or cues (e.g., a boy representing himself as a small dot). A pattern of visual complexity may express the S's personal complexity. The patient's response to his art work may be threefold: physical (e.g., a change of heartbeat); rational, as an integration of piecemeal thoughts about the self; and emotional, as strong and clear feelings evoked by the new rational insight.—R. Arnheim.

10008. Bloch, Gottfried R. & Bloch, Noretta H. **[Psychotherapeutic interventions in post-traumatic reactions.]** (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(5), 277-290.—Contends that the aim of therapy with patients who have suffered a traumatic experience is to help them tolerate drastic emotional and physical impairments and to master as fast as possible the psychological effects. Lack of motivation for treatment, resistance, difficulty in gaining insight, and disheartening actual situations may discourage both patient and therapist. The focal problem is to restore the shaken narcissistic equilibrium and its stability prior to the insult. Ego-mechanisms supporting development towards the adaptation to the post-traumatic condition are utilized; directive intervention and adaptational coaching are integrated in the total approach.—H. Bruml.

10009. Bras, Stanislav. **[Treatment of resistance in analytic psychotherapy: I.]** (Slov) *Anthropos*, 1972, No 1-2, 123-140.—Discusses the phenomenon of resistance, defined as the set of all those psychodynamic factors in the therapeutic process which prevent subconscious tendencies from reaching the conscious level. Types of resistance are classified into 12 categories and described in detail: (a) resistance in the form of suppression or repression, (b) compulsive withdrawal into health, (c) resistance through intensification of neurotic symptoms, (d) resistance by means of mental inhibitions, (e) willful disqualification of self, (f) resistance in the disguise of irrationality, (g) superficial verbal communication, (h) insight as a form of resistance, (i) unwillingness to give up the comforts of therapy, (j) dissociation of therapeutic situation from real life, (k) resistance in the form of underestimation of reality, and (l) transference resistance. Techniques for coping with various types of resistance are discussed.—S. Slak.

10010. Caetano, Donald F. (California State Coll, San Bernardino) **Labeling theory and the presumption of mental illness in diagnosis: An experimental design.**

*Journal of Health & Social Behavior*, 1974(Sep), Vol 15(3), 253-260.—Videotaped psychiatric interviews of a mental patient and a student were diagnosed by 36 psychiatrists and 77 college students in an abnormal psychology class. Each sample was experimentally assigned to 2 groups. In one group it was suggested that both Ss were mental patients. In the other it was suggested that both were paid participants. It was hypothesized that the suggestion of illness and the increased clinical experience of psychiatrists would lead to an increase in diagnostic scores. Results partially support this hypothesis, in that suggestion and clinical experience led to significantly higher scores in all but 1 case. Also discussed are the effects of the appearances of the Ss in the tapes. (19 ref) —*Journal abstract.*

10011. Cancrini, E. & Tedini, G. (U Rome, Italy) [The concept of denial.] (Ital) *Rivista di Psichiatria*, 1974(Spr), Vol 9(3), 173-184.—Discusses the problem of resistance in establishing personal rapport.

10012. Chuc, Wassily. (U Federal de Goiás, Brazil) [Psychotherapy of the psychoses: Evaluative analysis.] (Port) *Jornal Brasileiro de Psiquiatria*, 1972(Jan), Vol 21(1), 23-31.—Argues that psychiatry is the only discipline properly equipped to diagnose and treat psychoses. Classical psychoanalytic techniques, however, are viewed as too inflexible and restricted in application. Selective use of a wide "psychotherapeutic pool" of techniques (medication, sociotherapy, re-education, etc) is recommended to maximize the patient's readaptation to life.—D. J. Clair.

10013. de Vol, Thomas I. (U Missouri, Columbia) Ecstatic pentecostal prayer and meditation. *Journal of Religion & Health*, 1974(Oct), Vol 13(4), 285-288.—The Pentecostal experience of altered consciousness resulting in "speaking in tongues" is described by a graduate student in psychology who was trained to use this method by age 11. It is likened to insights obtained by ego psychology and Gestalt methods and is recommended because it is available easily and at will if the individual is properly conditioned for its use.

10014. Dougherty, Catherine A. (Villanova U, Coll of Nursing) Group art therapy: A Jungian approach. *American Journal of Art Therapy*, 1974(Apr), Vol 13(3), 229-236.—Reports an experiment in group art therapy for 5 nonverbal schizophrenic patients. Theoretical questions concerning the application of Jung's theories to the interpretation of patients' art work are discussed.

10015. Ellis, Albert. (Inst for Advanced Study in Rational Psychotherapy, New York, NY) The treatment of sex and love problems in women. In V. Franks & V. Burtie (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10016. Fabrikant, Benjamin. (Fairleigh Dickinson U) The psychotherapist and the female patient: Perceptions, misperceptions and change. In V. Franks & V. Burtie (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10017. Farkas, Paul. Case report using aides in hypnotherapy. *Journal of the American Optometric Association*, 1974(Dec), Vol 45(12), 1402-1403.—Describes a technique used to transfer a patient under

hypnosis to the control of an aide to carry out technical tasks. The method allows for the most efficient use of professional time by making optimum use of ancillary personnel, while patients are under hypnosis. The case of a 21-yr-old male who required contact lenses for occupational purposes, but who feared to wear them, is discussed to illustrate the technique.—*Journal abstract.*

10018. Fiske, Donald W. (U Chicago) A source of data is not a measuring instrument. *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 20-23.—Discusses a study by J. I. Berzins et al (see PA, Vol 53:Issue 5) which used a national sample and made multiple analyses of data on the outcome of psychotherapy. While they appropriately stress the disagreements among sources of data, their hope for a remedy is futile. A source of data yields observations from a distinctive role providing distinctive experience. When an observer representing a source makes judgments about the complex variables of interest to current psychotherapeutic theory, he is actively processing his own experience. His observations may agree fairly well with parallel observers representing that source, but will not agree as well with observers from other sources. Nearly exact agreement can be obtained only from inanimate measuring instruments or from observers functioning like instruments.—*Journal abstract.*

10019. Fodor, Iris G. (New York U) The phobic syndrome in women: Implications for treatment. In V. Franks & V. Burtie (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10020. Folsom, James C. (VA Hosp, Tuscaloosa, AL) Attitude therapy. In L. M. Irvine, T. B. Brelje (Eds), *Law, psychiatry and the mentally disordered offender: I*. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.—Describes some basic principles of attitude therapy, a type of behavior and attitude management which enables the patient to change his maladaptive behavior patterns and develop self-determination. Implications of attitude therapy for mental health facility goals and staff-patient relationships are discussed.

10021. Franks, Violet & Burtie, Vasant (Eds.). *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10022. Garetz, Floyd K. (U Minnesota, Medical School) The psychiatrist's involvement with aged patients. *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 63-65.—Studied, via questionnaire, psychiatrists' involvement with older patients in relation to the psychiatrists' ages and the nature of their practices. Data from 184 respondents (91% of those polled) show that older psychiatrists see a higher proportion of older patients, advocate more comprehensive treatment, and find older patients more interesting and gratifying. Psychiatrists in general psychiatry and those who have a primarily inpatient practice see the largest proportion of older patients.—*Journal abstract.*

10023. Gordon, Rosemary. Reflections on creation, therapy and communication. *Art Psychotherapy*, 1973(Fal), Vol 1(2), 109-112.—Of the 4 stages of the creative process—preparation, incubation, illumination, and verification—the 1st and 4th require the use of conscious ego functions, whereas the 2nd and 3rd

demand surrender of ego control and tolerance of doubt, anxiety, and awe. The latter 2 stages are the truly creative ones and call for aloneness, silence, and noninterpretation without loss of contact between patient and analyst.—*R. Arnheim.*

10024. Göhler, Irene & Ohms, Ute. (Klinik für Kinderneuropsychiatrie der Karl-Marx-U, Leipzig, E Germany) [Riding: A therapeutic possibility for neuropsychiatry in childhood?] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Apr), Vol 26(4), 248-249.—Reports favorable therapeutic results from training in horseback riding given to a group of 6 emotionally disturbed children 8-18 yrs old. It is reported that the closely supervised riding sessions caused rapid reduction in anxiety, increase in self-reliance, and improved contact with others.

10025. Haas, Monika & Haas, Wolfgang. (Universitätsnervenklinik des Bereichs Medizin (Charité) de Humboldt U, Berlin, E Germany) [Occurrence of a change of symptoms during individual therapy for neurosis.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Apr), Vol 26(4), 231-235.—Speculates on changing symptoms of neurosis after individual therapy begins. Reduction of anxiety is easier to see than is progress in other neurotic syndromes.

10026. Hanson, Barbara. (Foxborough State Hosp, MA) Black process in clinically depressed women: A conceptual framework for practice. *Clinical Social Work Journal*, 1974(Fal), Vol 2(3), 163-171.—Emphasizes the importance of considering black patients in their current social context. Observations were made of 6 black outpatients treated at Boston State Hospital for periods of 9 mo to 2 yrs. Patients were moderately to severely depressed, and were assigned at random to weekly psychotherapy. The importance of understanding Bennett's conception of black process as an extension of diagnostic skill is stressed.—*S. R. Stein.*

10027. Henderson, Joseph L. (C. G. Jung Inst, San Francisco, CA) The picture method in Jungian psychotherapy. *Art Psychotherapy*, 1973(Fal), Vol 1(2), 135-140.—The picture method recommended by Jung as a means of expanding consciousness is distinguished from purely unconscious projections in automatic doodling as well as from counterproductive indulgence in art for art's sake. More like a true artist, the patient relies on a broader range of mental resources to represent archetypal themes, such as the descent to the night-world or the synthesis symbolized by mandalas. Examples from psychiatric practice are compared with Jung's own mural paintings and the work of a self-taught black woman artist.—*R. Arnheim.*

[Negative transference and resistance to after care.] (Germ) *Dynamische Psychiatrie*, 1973, Vol 6(6), 427-433.—Investigated negative transference and rejection of aftercare in schizophrenic patients. Ss in Exp I were 57 1-51 yr old diagnosed schizophrenics discharged about 6 wks prior to the study; 62% had neither kept their appointment nor arranged for a new one. Ss in Exp II were 14 schizophrenic, 18-44 yr old patients who had been treated clinically 3-5 times but had not kept their aftercare appointments in between admissions. Separate interviews of patients and persons in whose custody they

had been released revealed that 6 Ss disliked their doctor and felt that he would not help them, 7 did not feel the need for additional help, and 1 could not come for job related reasons. According to family members 9 Ss became very agitated (2 even violent) when the aftercare appointment was mentioned and refused to keep it, 2 Ss lied that the doctor had called the appointment optional and unnecessary, 2 family members had believed that no further help was needed by the patient, and 1 said that whether to go or not was up to the patient. Results reveal an active resistance to aftercare rather than indifference, apathy, low motivation, or paranoid trends. It is stated that the principal factor causing the resistance is an unresolved negative transference which could defeat the effect of the treatment or make therapy and analysis impossible. (English summary) (16 ref)—*T. Fisher.*

By employing methods of "cognitive restructuring" instead of "systematic desensitization" in treating phobic conditions, the mean number of sessions required to overcome each phobia dropped sharply. The

precise operations of "cognitive restructuring" are illustrated by a case dialogue.—C. P. McCreary.

10033. Ládgero Pires, Luiz. [Reactions of patients to psychiatric diagnosis and treatment.] (Port) *Jornal Brasileiro de Psiquiatria*, 1972(Jan), Vol 21(1), 147-156.—Summarizes the cases of 5 adult female inpatients. Cultural and treatment factors which are viewed as the chief causes of change in the behavior of these patients are discussed.

10034. Leedy, Jack J. & Rapp, Elaine. (Poetry Therapy Ctr, New York, NY) *Poetry therapy and some links to art therapy*. *Art Psychotherapy*, 1973(Fal), Vol 1(2), 145-151.—As a supplement to therapy, patients are asked to write and read poetry. Poems from English and American literature are selected for the relief of insomnia, anxiety, or depression. Rhythm as well as content contribute to the effect. Poems written by patients can serve diagnostically (e.g., to indicate suicidal tendencies), or therapeutically to help diffuse and sometimes resolve conflicts. In art workshops for creative growth, art activity has been found to trigger spontaneous poetry writing by some participants, indicating a link between verbal and visual media.—R. Arnheim.

10035. Leigh, Hoyle. (Yale U, Medical School) *Psychotherapy of a suicidal, terminal cancer patient*. *International Journal of Psychiatry in Medicine*, 1974(Spr), Vol 5(2), 173-182.—Presents the case history and psychotherapeutic course of a terminal cancer patient from her suicide attempt to her eventual death from cancer. The discussion is focused on the therapy which opened the communication barrier that had caused the suicide attempt. The role of the therapist as facilitator of communication in the family and educator of the family regarding the illness is described, and the psychological needs of the terminal patient are considered.—R. M. Cohen.

10036. Liegner, Evelyn. (Private practice, Great Neck, NY) *The silent patient*. *Psychoanalytic Review*, 1974(Sum), Vol 61(2), 229-245.—Discusses the multiple purposes of silence for the patient, as a resistance and as a communication. While initially considered by Freud as a resistance to transference, a broader understanding of silence suggests a variety of techniques suited to the particular needs of the patient. 3 case presentations illustrate a variety of ways for treating the silent patient. (27 ref)—B. Smith.

10037. Longin, Harold E. (Weston State Hosp, WV) *Perception of symptomatic behaviors*. *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 812-818.—Used a multidimensional scaling technique, INDSCAL, to investigate the underlying structure 18 behavioral and 18 nonbehavioral clinical psychologists gave to 73 symptomatic behaviors descriptive of a wide range of psychopathology. 2 partially related dimensions seemed to account for the obtained configuration: Dimension 1 was labeled psychotic-neurotic, and Dimension 2 was labeled turning within oneself—turning to others. These dimensions were similar to those found in other studies. Only limited differences between behavioral and nonbehavioral raters in the structure they provided the diagnostic cues were observed, suggesting that the clinician's theoretical persuasion is not a critical

discriminator of the way he or she views symptoms. (21 ref)—*Journal abstract*.

10038. Lorian, Raymond P. (Temple U) *Social class, treatment attitudes, and expectations*. *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 920.—Administered the Mental Health Attitude Survey (MHAS) to 90 white outpatient psychotherapy clinic applicants from middle, working, and unskilled socioeconomic status (SES) levels. Findings suggest that prior assumptions about differences in help-seeking attitudes and treatment expectations among SES groups must be carefully reevaluated, since no significant effects for sex, SES, or interactions were found on any MHAS dimension.

10039. Loveless, Eugene J. & Brody, Helen M. (William Paterson Coll) *The cognitive base of psychotherapy*. *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 133-137.—Discusses the role of information and the cognitive elaboration of problem-solving skills as the basis of patient gains in psychotherapy. It is suggested that the proper approach in therapy is an active, problem-oriented, cognitive restructuring of the client's difficulties. Techniques for such an intervention are outlined. The role of pertinent cognitive analysis as described by A. Ellis and G. Kelly is suggested as the basis of an intelligent psychotherapeutic paradigm.—C. P. McCreary.

10040. Maduro, Renaldo J. & Martinez, Carlos F. (U California, Medical Ctr, Langley Porter Neuropsychiatric Inst, San Francisco) *Latino dream analysis: Opportunity for confrontation*. *Social Casework*, 1974(Oct), Vol 55(8), 461-469.—Reports that in clinical work with Latinos, aspects of Jungian dream theory and analytic technique have been found especially useful. Dream analysis is 1 aspect of the work of self-actualization and Jung's humanistic growth-oriented psychology. 3 types of dreams by Latinos are described. When therapeutic modalities are made culturally relevant, strong working alliances and intense commitment to growth often follow.—M. W. Linn.

10041. Malageli-Tegliatti, M. et al. (U Rome, Italy) *[Family psychotherapy and the work of denial.]* (Ital) *Rivista di Psichiatria*, 1974(Spr), Vol 9(3), 161-172.—Contents that much of the strange, incomprehensible, and pathological behavior observed in family psychotherapy can be understood as the workings of denial.

10042. Margolin, Michael H. & Goldman, Susan B. (Travelers Aid Society of Metropolitan Detroit, MI) *Beyond reinforcement: Integrating relationship and behavior therapy*. *Clinical Social Work Journal*, 1974(Sum), Vol 2(2), 96-104.—Discusses similarities and differences between relationship therapy and behavioral therapy in terms of reinforcement and relationship. The 2 methods are shown to involve both aspects in treatment, though the emphasis differs.

10043. Marlin, William. (Camden County Coll) *A portrait through poetry and drawing*. *American Journal of Art Therapy*, 1974(Apr), Vol 13(3), 237-249.—Reports on the case of a 39-yr-old terminal cancer patient who attempted to deal with the emotional problems of her situation through her poetry and drawings. The work of the Creative Arts Rehabilitation Center in New York City is also described.

10044. Marshall, Robert J. (Westchester Psychiatric Group, Yorktown Heights, NY) **Meeting the resistances of delinquents.** *Psychoanalytic Review*, 1974(Sum), Vol 61(2), 295-304.—Describes interventions in individual therapy that do not rely on interpretation or confrontation. Techniques of joining the patient's resistance facilitated treatment. Joining with the defense is explained as siding with the parental covert message in a double-bind situation. Making this covert message overt, in the transference, allows the confusion and anxiety of the patient to be lifted. Total milieu involvement in playing out planned roles is discussed. (20 ref)—B. Smith.

10045. Martin, Fred W. (U Waterloo, Ontario, Canada) **Therapeutic recreation practice: A philosophic overview.** *Journal of Leisureability*, 1974(Jan), Vol 1(1), 20-26.—Reviews the relatively recent development of recreation therapy as a field in the treatment of the ill and disabled. 4 basic approaches ranging from "fun and games" to education are described. It is suggested that the field should strive for a coherent therapeutic philosophy at this stage in its development.

10046. Masnik, Ruth. (Metropolitan Hosp, New York, NY) **Telling a schizophrenic patient his diagnosis.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 452-457.—Discusses the effect on the patient of acknowledging to him that he has been diagnosed as schizophrenic. An illustrative case is presented to show how this knowledge and understanding helped a 26-yr-old male patient mobilize himself and begin to lead a more productive and satisfying life.

10047. McLean, Peter D. & Miles, James W. (U British Columbia, Vancouver, Canada) **Evaluation and the problem-oriented record in psychiatry.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 622-625.—Considers that both evaluation of treatment programs and the problem-oriented record (POR) are in vogue in psychiatry. Although the POR in its present form can enhance communication and organization, it is unlikely that it will contribute greatly to teaching, research, or to the development of treatment efficacy, since these enterprises require evaluative information available only from patient follow-up, which is the cardinal feature missing from the POR. The inclusion of a follow-up component in the POR represents a natural extension of progress notes and is pragmatic enough to be considered as part of routine practice. (28 ref)—*Journal abstract*.

10048. Menaker, Esther. (New York U) **The therapy of women in the light of psychoanalytic theory and the emergence of a new view.** In V. Franks & V. Burtie (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10049. Montagnes, James M. (Mental Health Ctr, Penetanguishene, Ontario, Canada) **Theory or the man.** *Journal of Leisureability*, 1974(Oct), Vol 1(4), 42-45.—Summarizes evidence indicating that approximately equal rates of improvement result from widely different psychotherapeutic approaches. The importance of both the therapist and client's expectations, and their interaction, is stressed. The therapist's personality is seen as an influential factor in outcome. It is stated that not all therapists can effectively use all techniques, and that not

all techniques are appropriate for use with all patients. The importance of the fit of therapist, client, and theory and its potential effect on outcome is stressed.—C. Wright.

10050. Mundy, Jean. (Long Island U) **Feminist therapy with lesbians and other women.** *Homosexual Counseling Journal*, 1974(Oct), Vol 1(4), 154-159.—Examines differential approaches to problems of identity in lesbians and other women from a feminist point of view. It is suggested that women should self-define themselves rather than be defined in terms of their relationships with other people. Feminist therapy is presented as a means of advancing the aims of the feminist social movement to the benefit of all.—*Journal abstract*.

10051. Neki, J. S. (All-India Inst of Medical Sciences, New Delhi) **A reappraisal of the guru-chela relationship as a therapeutic paradigm.** *International Mental Health Research Newsletter*, 1974(Sum), Vol 16(2), 2-7. Describes the guru-chela (master-disciple) relationship in terms of its similarities with and differences from the classical Western therapist-patient relationship. Both are voluntary associations wherein a master enables a change-seeker to dispel ignorance and the effects of undesirable social conditioning. They differ mainly in that the guru-chela relationship encourages permanent dependency, since the guru assumes total responsibility for leading the chela toward self-mastery through the disciplines of persistence and silence. As a therapeutic paradigm, the guru-chela relationship appears most suited to cultures valuing self-discipline rather than self-expression, and creative harmony between individual and society.—C. A. Heikkinen.

10052. Neto, Bernardo B. (Catholic U São Paulo, Faculty of Psychology, Brazil) **Some considerations of negative therapeutic reactions.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 445-451. Describes the characteristics of a negative therapeutic reaction shown by a male actor during psychotherapy. As long as envy was interpreted as the cause of this reaction, analysis did not progress. However, interpretation of the reaction as a communication of the patient's anxiety helped to crystallize the therapeutic evolution.

10053. Polster, Miriam. (Gestalt Training Ctr, San Diego, CA) **Women in therapy: A Gestalt therapist's view.** In V. Franks & V. Burtie (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10054. Price-Williams, Douglass. (U California, Los Angeles) **Psychological experiment and anthropology: The problem of categories.** *Ethos*, 1974(Sum), Vol 2(2), 95-114.—Discusses problems caused by the application of logical categories which govern Western psychological investigations to the study of other cultures. It is suggested that the conventional psychological distinctions between intellect and emotion, abstract and concrete, and metaphor and fact are not universally viewed as important to the understanding of behavior. (2 p ref)

10055. Raymond, Margaret E.; Slaby, Andrew E. & Lieb, Julian. (Connecticut Mental Health Ctr, New Haven) **The healing alliance.** New York, NY: W. W. Norton, 1975. 287 p. \$8.95.—Outlines an approach to the treatment of patients with emotional problems which

involves an active collaboration between professional, patient, and family to form a healing alliance. 14 case histories are included to illustrate and clarify the psychiatric process and show how various forms of treatment affect family dynamics and relationships, how the family can participate in the planning of treatment goals, and how the family's attitude influences the outcome of treatment. (6½ p ref)

10056. Rice, David G.; Gurman, Alan S. & Razin, Andrew M. (U Wisconsin, Medical School, Madison) **Therapist sex, style, and theoretical orientation.** *Journal of Nervous & Mental Disease*, 1974(Dec), Vol 159(6), 413-421.—Analyzed the self-report questionnaires of rated in-therapy behaviors, demographic characteristics, and theoretical ascriptions of 86 therapists (47 males and 39 females) with diverse backgrounds and experience levels. "Style" factors obtained for this sample were compared with those from a previous sample of predominantly male therapists. Results indicate (a) a relatively consistent set of style factors relating to self-reported in-therapy behaviors emerging from the 2 therapist samples; (b) significant style differences between male and female therapists—women therapists reported themselves to be more varying in their therapy behavior, less "anonymous" in therapy, and more judgmental; (c) experienced therapists were more oriented toward historical material, showed more varied in-therapy behavior, and placed more emphasis on feelings than inexperienced therapists; and (d) the theoretical orientation of the therapist was related to differences in self-reported in-therapy behaviors, along somewhat stereotyped lines. Evidence for the generalizability of self-reported to other-described behaviors was obtained. (24 ref)—*Journal abstract*.

10057. Rosenfeld, David. [Drug addiction, narcissistic omnipotence, skin disorders, and corporal outline: Notes on group dialectics.] (Span) *Revista de Psicoanálisis*, 1974(Jan-Jun), Vol 31(1-2), 365-402.—Presents a synthesis of concepts related to psychoanalytic aspects of these problems, including transference and countertransference. (18 ref)

10058. Rubin, Judith A. (Point Park Coll) **Mother-child art sessions: II. Education in the community.** *American Journal of Art Therapy*, 1974(Apr), Vol 13(3), 219-227.—Presents the 2nd part of a 2-part article dealing with mother-child relations during sessions of intensive art therapy. It is concluded that shared art experiences are a useful tool in patient education and are particularly important for the preschool child.

10059. Škoda, C. & Gregová, L. (Výzkumný ústav psychiatrický, Prague, Czechoslovakia) [Some of the models used in the assessment of therapeutic results in psychiatry.] (Czech) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 65-71.—Presents a theoretical scheme in which psychopathologies are conceptualized and their treatment assessed from psychiatric, psychological, and sociological perspectives. Differences between the etiopathogenetic diagnoses used in medicine and the psychiatric nosology of syndromes, and between the psychodynamic approach and H. J. Eysenck's 3-dimensional model in psychology are discussed. The preventive, therapeutic, and predictive effectiveness of each

model is viewed as the criterion of its validity. (Russian & English summaries)—*V. Fischmann*.

10060. Saffer, Jerry B. & Kelly, Gretchen L. (U Virginia, Medical Ctr) **Treating the obese adolescent.** *Psychiatric Forum*, 1974(Fal), Vol 4(2), 27-32.—Describes the theory and implementation of a treatment program at a clinic for obese adolescents. Because of its extreme dependency and social isolation, adolescence is considered a traumatic stage for obese youngsters. The program concentrated on 3 areas—nutrition, physical exercise, and psychotherapy. Psychotherapy was considered an appropriate technique because it fosters the development of interpersonal skills, independence, and the sharing of common negative feelings, and because it has proved successful with adult obesity groups. The most salient initial finding was the absence of social and verbal skills among the adolescents. However, after 6 mo of participation, there was marked improvement in the development of these skills in addition to a significant weight loss. (16 ref)—*F. Beyer*.

10061. Shor, Joel & Sanville, Jean. (Inst of the Los Angeles Society for Psychoanalytic Psychology, CA) **Erotic provocations and dalliances in psychotherapeutic practice: Some clinical cues for preventing and repairing therapist-patient collusion.** *Clinical Social Work Journal*, 1974(Sum), Vol 2(2), 83-95.—Presents 4 types of case material for discussion: (a) patients who report intercourse with a previous therapist; (b) patients who report that a previous therapist recommended intercourse with him; (c) patients who report seductive gestures by a previous therapist; and (d) patients who request or demand intercourse during therapy. Treatment approaches are offered which help deal with these issues.—*S. R. Stein*.

10062. Slassi, Iradj. (Rutgers State U) **Psychotherapy with women and men of lower classes.** In V. Franks & V. Burtie (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10063. Steinmann, Anne. (Maferr Foundation, Male-Female Role Research, New York, NY) **Cultural values, female role expectancies and therapeutic goals: Research and Interpretation.** In V. Franks & V. Burtie (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10064. Suedfeld, Peter & Ikard, Frederick F. (U British Columbia, Vancouver, Canada) **Use of sensory deprivation in facilitating the reduction of cigarette smoking.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 888-895.—12 mo after a 24-hr period in a socially isolated, monotonous environment, 37 smokers aged 25-55 had reduced their rate of cigarette smoking by an average of 48%, compared with 16% for 35 control Ss. A smaller sample reported similar results at the end of 24 mo. A set of antismoking messages had no permanent effect. Sensory deprivation can apparently be used as a powerful facilitator of long-term behavioral change in human beings. (37 ref)—*Journal abstract*.

10065. Uemura, Akira. (Fukuoka U, Faculty of Medicine, Japan) **A case of the transient psychotic breakdown of a depersonalized patient during the**

**psychotherapeutic process.]** (Japn) *Kyushu Neuro-psychiatry*, 1973(Dec), Vol 19(3-4), 213-218.—Reports the case of a male patient from April 1971 to October 1973. S was first diagnosed as suffering from chronic depersonalization. The symptoms were thought to be based on 2 defense mechanisms—defense of the oedipal feeling and transference of pre-oedipal feelings—and the development of these mechanisms was thought to be closely related to the patient's experience with his parents. The goals of the initial phase of therapy were the patient's acceptance of the emotional support of the therapist and his realization of the defense mechanism. These goals, however, were not achieved until later, because early in the treatment the patient experienced ego-splitting and a transient psychotic breakdown. But as he recovered from his psychotic state, his depersonalization symptoms disappeared; current progress in therapy and potential for recovery from his mental illness were shown. (English summary)—*S. Ashida*.

10066. **Vaccaro, V. Michael.** (Hahnemann Community Mental Health Ctr, Philadelphia, PA) **Specific aspects of the psychology of art therapy.** *Art Psychotherapy*, 1973(Fal), Vol 1(2), 81-89.—Art products, like dreams, externalize intrapsychic remnants, memory traces, or somatic excitations. The more intense the patient's pathology, the stronger is the urge to discharge excitation by art production. Relevant spontaneous associations of the patients to their art work, although helpful in interpretation, are difficult to obtain and may carry the risk of further regression through threatening insight. When the patient does not recognize the latent content of his art, he may use it as mere projective stimulus material. Therefore, standard Freudian interpretation of sexual symbols is recommended to gauge the patient's psychosexual development. Improvement obtained by interpreting 2 drawings is reported in the case of a 29-year-old schizophrenic man.—*R. Arnheim*.

10067. **Van Krevelen, D. Arn.** [Judo in the framework of movement therapy: Results of an inquiry.] (Germ) *Acta Paedopsychiatrica*, 1974, Vol 40(6), 221-229.—Homes for morons do not reject judo as advisable movement training, but institutions for the feeble-minded do so because their patients lack self-insight and self-control, making them dangerous to their environment. The advantages—motor control, improvement of self-defense and self-esteem—can be acquired by other and better means.

10068. **Vymětal, J.** (Krajský ústav národního zdraví, Sadská, Czechoslovakia) [Nondirective "Gesprächpsychotherapie" according to Prof. R. Tausche.] (Czec) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 128-132.—Summarizes a 1971 lecture given at the regular working session of the Psychiatric Association in Prague. R. Tausche's team in Hamburg bases its work in C. Roger's client-centered therapy. They emphasize verbalization of emotional experiences, unconditionally positive regard for the client, and emotional warmth on the part of the therapist. The nondirective method is considered more optimistic, constructive, scientific, successful, and rapid than other psychotherapeutic systems. (Russian & English summaries)—*V. Fischmann*.

10069. **Wadeson, Harriet.** (NIMH, Adult Psychiatry Branch, Psychiatric Assessment Section, Bethesda, MD)

**Separateness.** *Art Psychotherapy*, 1973(Fal), Vol 1(2), 131-133.—Presents an elaborate symbolic drawing by a young hospitalized schizophrenic as an example of how a patient's sense of separateness can be overcome by the sharing of imagery. The picture of his inner world, experienced at different times as a delusion and as reality, represents the patient's "way of being in a safe place at the time of judgment." It is dominated by the eye of God and represents the marihuana plant as a nude female figure rooted in the ground. By communicating his complex delusional system to the therapist, he experienced the interest of another in his private world.—*R. Arnheim*.

10070. **Wilkins, Wallace.** (U Maine, Orono) **Parameters of therapeutic imagery: Directions from case studies.** *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 163-171.—Reviews and systematizes case studies describing psychotherapeutic imagery techniques. Imagined scenes are classified in relation to presenting symptoms; symptoms are classified as covert behaviors, overt avoidance behaviors, or overt approach behaviors. Imagery techniques are classified as involving attention shifts from symptom-related scenes toward overt stimuli or toward other covert events. Trends are described that show how techniques involving attention shifts toward other covert events are applied to reduce overt behaviors. Instructed attention shift toward and from symptom-related scenes appears to be the only necessary element in psychotherapeutic imagery.—*C. P. McCreary*.

10071. **Wise, Thomas N.** (Johns Hopkins Hosp. Psychiatric Liaison Service) **Psychiatric management of patients who threaten to sign out against medical advice.** *International Journal of Psychiatry in Medicine*, 1974(Spr), Vol 5(2), 153-160.—Presents case examples to show how communication problems, issues of control, and the use of denial can precipitate a crisis which may lead to premature hospital discharge. Suggestions for consultative intervention are offered.

10072. **Worthen, Valerie.** (Fuller Theological Seminary) **Psychotherapy and Catholic confession.** *Journal of Religion & Health*, 1974(Oct), Vol 13(4), 275-284.—Maintains that psychotherapy and Roman Catholic penance are similar, both dealing with guilt and change of behavior. While confession is more ritualized and psychotherapy more objective than its counterpart method, psychotherapy could become more effective if it were perceived as part of "a total restoration process of man toward truth." It is suggested that for Catholic constituents at least, confession combined with psychotherapy promises a more effective ordering of their lives than either method alone.—*F. A. Hardt*.

10073. **Yalom, Irvin D. & Elkin, Ginny.** (Stanford U. Medical School) **Every day gets a little closer: A twice-told therapy.** New York, NY: Basic Books, 1974. xxiv, 244 p. \$8.95.—Presents an account, in the form of journals, of the treatment of a young woman, labeled as "schizoid," by her psychiatrist. The woman's experiences in all types of therapy, the dual reflections of psychiatrist and patient, and the psychiatrist's perception of his professional and personal roles are described in an effort to examine the nature of the psychotherapeutic experience.

10074. Young, Gregory G. **Programmed psychotherapy.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 369-382.—Discusses programmed psychotherapy (PPT)—a psychotherapeutic technique that presents to the patient a series of personally significant problems and appropriate solutions from among alternatives for his consideration and response. The problems are derived from the patient's own diagnostic interviews and from a library of like problems gleaned from the treatment of similar patients. It is emphasized that this is only a tool, a component of the total psychotherapeutic process. Clinical impressions of its value and helpfulness are presented through case examples. In PPT the earliest prescription produces an understandable rationale concerning the etiology of the patient's problems. The fact of alternatives being presented in addition to the usual insight is another significant aspect of this method. Resistances or defensive mechanisms encountered in other types of psychotherapy are also present in this method. Observations, results of ratings, and follow-up on 100 patients are presented.—R. S. Albin.

10075. Yustin, Alvin S. (U Southern California, Medical School) **Analysis of crises using a stress-motivation-response model.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 409-417.—Describes a model to analyze situations which disrupt the equilibrium between individuals and their environment. Responses used in interpersonal interactions are neutralizing behaviors and conceptualizations of reassuring ideas. This kind of analysis of stress clearly defines the patient's life situation and responses to it, thereby allowing the therapist to focus more easily on the crisis in the patient's life. The usual adaptive mechanisms which maintain equilibrium between patient and environment are defined. Interventions in the areas of defined stresses, motivations, and responses that can be used to restore the individual to his previous level of functioning are suggested. Case examples of 16 patients are presented to demonstrate the usefulness of this model.—R. S. Albin.

10076. Zierer, Edith. **Creative analysis: A projective technique and structured therapeutic method.** *Art Psychotherapy*, 1973(Fal), Vol 1(2), 101-108.—Describes a method of examining and interpreting spontaneous paintings by patients as to the integration and disintegration of color organization, which discloses a corresponding state of ego integration. Asked to name verbally an experience relevant to a personal conflict, patients then represent their theme pictorially. Relations between the consciously named problem and the unconsciously created color compositions are discussed with the patients and lead to diagnosis and suggestions for therapy. The chronological sequence of paintings is scored on the basis of a roster of 105 stress situations. Intensity of feeling tone for each level of color integration serves as an index of the patient's capacity to cope with his problem. Brief examples illustrate the procedure. (36 ref)—R. Arnheim.

10077. Zunin, Leonard. (Glasser Inst of Reality Therapy, Los Angeles, CA) **Reality therapy and campus prisons.** In L. M. Irvine, T. B. Brelje (Eds), *Law, psychiatry and the mentally disordered offender*. I. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.

## Drug Therapy & Drug Rehabilitation

10078. Adler, Sheldon. (U Pittsburgh, Medical School, Montefiore Hosp) **Methyldopa-induced decrease in mental activity.** *JAMA: Journal of the American Medical Association*, 1974(Dec), Vol 230(10), 1428-1429.—Reports the cases of 5 professional people, including 3 physicians, an engineer, and an accountant, who experienced severe changes in mental acuity. These changes included lack of concentrating ability, amnesia-like episodes, difficulty in simple calculations, and problems in reading. Each was taking methyldopa at normal dosages, and when treatment with this drug was discontinued the mental symptoms disappeared within 96 hrs. These cases emphasize the importance of questioning patients taking methyldopa about difficulties in mentation.—*Journal abstract*.

10079. Alraksinen, E. M. (U Helsinki, Finland) **Tryptophan treatment of infants with Down's syndrome.** *Annals of Clinical Research*, 1974(Feb), Vol 6(1), 33-39.—5-hydroxytryptophan (5HTP) has been reported to increase the muscle tone and the blood 5-hydroxytryptamine (5HT) content in infants with Down's syndrome (DS). In this study levotryptophan (10-50 mg/kg/day) was given chronically for up to 2 yrs to 9 newborn infants with DS. 14 untreated infants with DS served as controls. The muscle tone of tryptophan-treated Ss with DS improved most clearly during the 1st half year of life. During the 1st yr the mean level of 5HT in the platelet-rich plasma of treated Ss was significantly higher than that in untreated controls but did not reach the level found in 22 healthy infants. Side-effects resembling those of 5HTP occurred, and 1 of the 9 patients developed an infantile spasm syndrome. (25 ref)—*Journal abstract*.

10080. Altman, Harold; Evenson, Richard C.; Sletten, Ivan W. & Cho, Dong Won. (U Missouri, Medical School) **Computer prediction of psychotropic drug assignment in state mental facilities: Effect of eliminating alcoholics from the study sample.** *Diseases of the Nervous System*, 1974(Nov), Vol 35(11), 505-508.—Studied utilization of a computer to assign psychotropic drugs based on statistical models. A sample of 3,314 inpatients from 8 state institutions were analyzed and all those diagnosed as alcoholic were excluded. This resulted in a final sample size of 2,092 patients. Data available for analysis consisted of the 11-item Automated Mental Status checklist filled out within a few days of admission, 73 demographic variables collected as admission face sheet information, and an admission diagnosis. A stepwise discriminant analysis was performed. Results confirmed the hypothesis that patients assigned minor tranquilizers consisted of 2 distinct subgroups, one of which consisted of diagnosed alcoholics. It was found that minor tranquilizer assignment to nonalcoholic inpatients was a virtually random procedure. The general ability of predicting psychotropic drug assignment with a statistical model was nevertheless supported.—R. S. Albin.

10081. Ballinger, B. R.; Presly, A.; Reid, A. H. & Stevenson, I. H. (Royal Dundee Liff Hosp, Scotland) **The effects of hypnotics on imipramine treatment.** *Psychopharmacologia*, 1974, Vol 39(3), 267-274.—Measured plasma imipramine (IMI) and desmethylinipramine concentrations and depression ratings over a 3-wk

period in 3 groups of depressed inpatients ( $N = 34$ ) given standard doses of IMI. The 1st group received IMI alone, and the others either amylobarbitone or nitrazepam in addition as a night sedative. Plasma antidepressant levels were consistently higher in the group receiving no hypnotic but only significantly so in the case of total IMI in the IMI-alone group compared to the group receiving IMI plus amylobarbitone. The interindividual differences in plasma levels were large. There was no difference between the groups with regard to changes in depression, sleep, or side effects. From a clinical point of view, there is no evidence from this study of adverse effects of these drugs given in combination nor any evidence to suggest that the dosage of IMI given should be adjusted when administered along with either of the hypnotics studied.—*Journal abstract.*

10082. Ban, T. A. et al. (World Health Organization Training Program in Biological Psychiatry, McGill U, Montreal, Quebec, Canada) **New drug developments in the Latin Americas: Argentina, Costa Rica, Mexico and Panama.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 33-36.—Describes the geography, population, psychiatric treatment, use of psychoactive drugs, and pharmacological research in Argentina, Costa Rica, Mexico, and Panama. The lack of sophistication of psychiatric treatment, the difficulties of carrying out drug trials, and the lack of government interference in this research are documented.

10083. Ban, Thomas A. (McGill U, Montreal, Quebec, Canada) **Negative findings with nicotinic acid in the treatment of schizophrenias.** *International Pharmacopsychiatry*, 1974, Vol 9(3), 172-187.—In view of the controversy regarding the effectiveness of nicotinic acid therapy in schizophrenic patients a series of systematic studies was designed to obtain relevant information on this treatment. Since the initiation of these collaborative studies approximately 6 yrs ago, 5 of the 12 originally designed clinical trials have been completed. Findings in these studies are reviewed and strongly suggest that the administration of nicotinic acid in the dosage of 3,000 mg/day has no therapeutic effect. Such administration may even have a negative therapeutic effect in unselected groups of schizophrenic patients. (59 ref)—*Journal abstract.*

10084. Bourne, Peter G. **Approaches to drug abuse prevention and treatment in rural areas.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 285-289.—Discusses drug abuse treatment strategies appropriate for small urban and rural communities. 4 stages of community response to drug abuse are described: denial, panic, fragmentation of effort, and cohesion. A progression of intervention approaches is suggested (hotline, drug abuse council, drug turn-in project, crisis intervention center, physician back-up, and a formal narcotic treatment program). Drug usage is viewed as symptomatic of a broader societal problems, and the possibility of a community's concern for drug abuse being channeled into concern for alcohol and tobacco abuse is suggested.—*R. Tomasko.*

10085. Bruck, J. & Guss, H. (Psychiatrischen Universitätsklinik Wien, Austria) **Aspects of treatment with long-acting neuroleptics with special consideration of clinical experiences gained with the peroral long-acting**

**agent penfluridol (R 16342-Janssen).]** (Germ) *International Pharmacopsychiatry*, 1974, Vol 9(3), 152-165.

—Presents a discussion of clinico-pharmacological, pharmacopsychiatric, psychological, and social aspects of treatment with long-acting neuroleptics. Previous experiences have confirmed the importance of repository preparations for secondary prevention and their economic value. An open clinical study is reported of the long-acting agent penfluridol, perorally administered to 50 patients suffering from schizophrenia. The predominantly antipsychotic substance remained effective for approximately 1 wk after application of a single dose ranging from 20 to 120 mg. Apart from extrapyramidal side effects penfluridol was well tolerated. No serious incidents were observed. (17 ref)—*English summary.*

10086. Burdock, Eugene I.; Gershon, Samuel; Hardesty, Anne S. & Linden, Karl J. **Problems and profits of cross-national collaborative studies.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 31-32.—Describes preliminary and incomplete data from a pilot study conducted in the US, Germany, and Switzerland to determine the feasibility of cross-cultural drug trials. Loxapine and chlorpromazine were tested on recently admitted schizophrenic inpatients. Problems and benefits of this approach are discussed.

10087. Burks, Jack S.; Walker, Jonathan E.; Rumack, Barry H. & Ott, John E. (U Colorado, Medical Ctr, Denver) **Tricyclic antidepressant poisoning: Reversal of coma, choreoathetosis, and myoclonus by physostigmine.** *JAMA: Journal of the American Medical Association*, 1974(Dec), Vol 230(10), 1405-1407.—One 2½-yr-old male and 1 36-yr-old female with coma, choreoathetoid movements, and myoclonus were found to be poisoned with tricyclic antidepressants. Physostigmine salicylate promptly reversed the neurologic abnormalities. These cases support the cholinergic deficiency-dopaminergic excess hypothesis of chorea. (20 ref)

10088. Carpenter, Robert L. & Sells, Clifford J. (U Washington, Child Development & Mental Retardation Ctr, Div of Speech Pathology & Audiology) **Measuring effects of psychoactive medication in a child with a learning disability.** *Journal of Learning Disabilities*, 1974(Nov), Vol 7(9), 545-550.—Notes that there is little information showing that specific psychoactive medications generally have predictable effects on children with learning disabilities. Thus, the need often arises to have a simple, but objective, method for determining whether a drug has effected a desired behavior change. 3 types of behavioral measurement are presented—direct measurement of behaviors, formal psychometric testing, and rating scales. The results of these techniques, when applied to a 4½-yr-old female on psychoactive medication, are also presented. The data do not demonstrate any drug effects on the behaviors for which the medication was prescribed.—*Journal abstract.*

10089. Chapman, Loren J.; Cameron, Richard; Cocke, Joseph G. & Pritchett, Thomas. (U Wisconsin) **Effects of phenothiazine withdrawal on proverb interpretation by chronic schizophrenics.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 24-29.—Administered 1 of the clinical forms of the Gorham Proverbs Test to 42 chronic schizophrenics while they were receiving antipsychotic medication and 2 forms 4 wks after drug withdrawal. 21

patients were tested first on drugs and then off, and 21 were tested first off drugs, then on. Some patients improved with drug withdrawal and some worsened. Scores of autism in proverb interpretation and ratings of clinical status agreed ( $p < .05$ ) on which patients improved or worsened. (19 ref)—*Journal abstract*.

10090. Charalampous, K. D.; Johnson, Philip C. & Estevez, Vincent. (Baylor Coll of Medicine, Houston, TX) Absorption and excretion of thioridazine and mesoridazine in man. *Diseases of the Nervous System*, 1974(Nov), Vol 35(11), 494-496.—Studied the relationship between clinical potency and rates of absorption and excretion of tritium labeled thioridazine and mesoridazine. Ss were 4 male schizophrenic inpatients in remission who had not received any drug treatment for at least 6 wks. It is concluded that metabolic differences seem to be the best explanation for difference in potency of these 2 drugs.

10091. Costa de Aquino, Maria T. [Psychic disturbances associated with cortisone treatment.] (Port) *Jornal Brasileiro de Psiquiatria*, 1972(Jan), Vol 21(1), 157-162.—Reviews conclusions in 10 articles dealing with cortisone and psychic disturbances. Caution is recommended in initiating cortisone treatment for patients with a psychiatric history.

10092. di Donato, Romano. (Free U Chieti, Medical School, Italy) [Psychotropic drugs in everyday practice.] (Ital) *Medicina Psicosomatica*, 1972(Oct), Vol 17(4), 295-323.—Examines the most important tranquilizers and antidepressants used in everyday medical practice. Recent discoveries about neurotransmitters and their relationship to drugs are reviewed. When patients request psychotropic drugs, the reasons most often given are anxiety and depression. The effects of the tranquilizers and antidepressants are reported in detail. They should not be used as a cure or remedy, but to promote a better relationship between doctor and patient. (English & French summaries) (46 ref)—*D. Araoz*.

10093. Drug Abuse Council. Heroin maintenance: The issues. *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 185-199.—Discusses the issues involved in establishing a heroin maintenance program. Topics considered include heroin toxicity, stabilization possibilities, detoxification, target population definition, effect on crime, and spread of addiction. A case study of Great Britain's heroin maintenance program is presented, and a Vera Institute of Justice proposal for a US program is discussed. Dissimilarities between the British and US drug abuse problem are noted.—*R. Tomasko*.

10094. Eldred, Carolyn A.; Grier, Velma V. & Berliner, Nancy. (Westat, Rockville, MD) Comprehensive treatment for heroin-addicted mothers. *Social Casework*, 1974(Oct), Vol 55(8), 470-477.—Describes a comprehensive treatment program. A pilot project studied 10 pairs of mothers on methadone maintenance. The progress of the treatment clients and the control clients was compared 8 mo after they had entered counseling. The treatment clients had made significantly more clinic visits per month than the controls and had only half as many urines positive for drugs.—*M. W. Linn*.

10095. Elliott, F.; Gardner-Thorpe, C.; Barwick, D. D. & Foster, J. B. (Permanente Medical Group, Santa Clara, CA) Jakob-Creutzfeldt disease: Modification of

clinical and electroencephalographic activity with methylphenidate and diazepam. *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Aug), Vol 37(8), 879-887.

10096. Elliott, Henry W. (U California, Medical School, Irvine) Pharmacology and clinical applications of narcotic antagonists. *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 225-229.—Discusses narcotic blocking agents with special emphasis on naloxone. Their usage in the treatment and diagnosis of narcotic addiction is presented. (24 ref)

10097. Erkkola, R.; Iisalo, E. & Punnonen, R. (U Turku, Finland) The effect of propranolol and oxazepam on some vegetative menopausal symptoms. *Annals of Clinical Research*, 1973(Aug), Vol 5(4), 208-213.—Compared the effects of propranolol and oxazepam on menopausal symptoms in 30 female patients (mean age = 39 yrs) undergoing hysterectomies. Ss were evaluated pre- and postoperatively without drugs and under treatment with both drugs separately. Heart rate, blood pressure, frequency and intensity of "hot flashes," and subjective menopausal symptoms were recorded. Propranolol eliminated the increase in sympathetic cardiovascular responses produced by the operation, while oxazepam had no effects. Oxazepam significantly reduced the frequency and intensity of the hot flashes more than did propranolol. Oxazepam also decreased subjective reports of palpitation and sleeplessness, while propranolol did not significantly change any reported symptoms. It is concluded that sensitization of the cardiovascular reflexes after a hysterectomy may be transmitted peripherally by beta-adrenergic receptors, although menopausal symptoms such as hot flashes are not mediated by beta-adrenergic receptors. (17 ref)—*Journal abstract*.

10098. Fann, William E.; Sullivan, John L. & Miller, Robert D. (Baylor Coll of Medicine, Houston, TX) Halazepam in anxious outpatients: A controlled study. *Current Therapeutic Research*, 1974(Dec), Vol 16(12), 1281-1286.—In previous studies in man, halazepam, a benzodiazepine, has exhibited anxiolytic properties definitely effective at 160 mg/day but not at 80 mg/day. The present study was designed to test effectiveness of halazepam at 120 mg/day in a 2-wk, placebo-controlled double-blind study in 79 23-65 yr old outpatients. Results in the 67 patients who completed the study indicate that the compound alleviates significant symptoms of anxiety in this population. Side effects were mainly limited to sedation. Halazepam appears to be safe and effective at the tested dose.—*Journal abstract*.

10099. Fine, Eric W. & Scoles, Pascal. (West Philadelphia Community Mental Health Consortium, Alcoholism Program, PA) Alcoholism: Turning a problem inside out. *MH*, 1974(Spr), Vol 58(2), 24-27.—Proposes that alcoholism needs to be viewed both as an individual and community problem. It is suggested that a community treatment program would be an appropriate method of treatment. Social, economical, medical, logistical, and moralistic arguments are discussed.

10100. Finney, Graham S. Planning for addiction services. *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 277-283.—Discusses the treatment and programmatic issues involved in the operation of the New York

City Addiction Services Agency. The sociological aspects of drug abuse planning are stressed.

10101. **Freedman, Joel.** (VA Hosp, Canandaigua, NY) **One vicious circle.** *MH*, 1974(Spr), Vol 58(2), 28-31.—Examines many reasons why alcoholics are attracted to and held by the dyssocial subculture of skid row. Ways of combating this problem are discussed. These include a multifunctional focus of attack involving all concerned parties, more action research, new experiments in relocating skid row addicts, establishing various types of half-way houses, and the devising of new creative treatment methods.

10102. **Friemert, Klaus; Beier, Rolf & Vehreschild, Torsten.** (Universitäts-Nervenklinik Rostock, E Germany) [Results of therapy with Lyogen-Depot in schizophrenic illnesses.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jun), Vol 26(6), 374-377.—Reports statistically significant decrease in seizures among schizophrenic patients on a Lyogen-Depot (fluphenazin decanoate) regimen. Simultaneous oral administration of 4 mg Lyogen is necessary to counteract extrapyramidal side effects.

10103. **Goby, Marshall J.; Filstead, William J. & Rossi, Jean J.** (Lutheran General Hosp, Alcoholism Rehabilitation Ctr, Park Ridge, IL) **Structural components of an alcoholism treatment program: Evaluations by patients and staff.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1266-1271.—The different aspects of the treatment program at an alcoholic rehabilitation center of a general hospital were ranked according to their importance by 60 patients and 31 professional staff members. The patients viewed their small group therapy experience, relationship with their counselor, and formal information as most helpful; the staff ranked other patients, small group therapy, and significant others as the most important aspects of the program. Results are discussed in terms of the possible effects on treatment when patients and staff have different conceptions of what is important in treatment. (17 ref)—*Journal abstract*.

10104. **Gospavić, Jelena & Vidaković, Zorica.** (Neuropsychiatric Clinic, Belgrade, Yugoslavia) [Mental disturbances in parkinsonian patients treated with levodopa.] (Socr) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(3), 21-28.—Describes the development of psychotic behavior patterns in 7 out of 17 parkinsonian patients treated with levodopa. (English summary)

10105. **Greenblatt, David J. & Shader, Richard I.** (Massachusetts General Hosp, Clinical Pharmacology Unit, Boston) **Drug therapy: Benzodiazepines: II.** *New England Journal of Medicine*, 1974(Dec), Vol 291(23), 1239-1243.—Discusses the use and effects of benzodiazepines in the treatment of anxiety, neuromuscular diseases, seizures, alcohol withdrawal, and sleep disorders, and their use in anesthesia and surgery. Unwanted effects and hazards related to the use of benzodiazepines include excessive central nervous system depression, sleep disturbances, injection site complications, and physiologic addiction if the drugs are abused.—*L. Gorsey*.

10106. **Herrmann, W. M. & Fabricius, J.** (Schering AG, Research Lab, Berlin, W Germany) **New psychotropic drug developments in Denmark, Russia, and**

**West Germany.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 28-30.—Describes 3 new psychotropic compounds being developed for use in Europe. A structurally new anticonvulsive drug (NSD 3004), a structurally new antipsychotic drug (karbidine), and a seroidal antiandrogen (cyproterone) which influences human sexual behavior are discussed. (40 ref)

10107. **Holtrisch, Adolpho; Modesto, José C. & de Oliveira Musacchio, Roberto.** (U Federal do Rio de Janeiro, Brazil) [Psychoanalysis and psychopharmacology.] (Port) *Jornal Brasileiro de Psiquiatria*, 1972(Jan), Vol 21(1), 9-21.—Discusses the collaboration of psychoanalysts and psychopharmacologists in treating difficult patients such as psychotics and psychopaths. Each specialist must preserve his own identity, but must also know something about the other's field. 3 articles by M. Ostow are cited which attempt to come to grips with these problems. The triangle of patient-analyst-psychopharmacologist is reviewed, considering the fantasies, defenses, and anxieties of each. (30 ref)—*D. J. Clair*.

10108. **Hollister, Leo E. & Prusmack, John J.** (VA Hosp, Palo Alto, CA) **Propranolol in withdrawal from opiates.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 695-698.—Conducted 3 studies involving 67 patients undergoing detoxification to evaluate the worth of propranolol hydrochloride in withdrawal of opiates. If propranolol acts as a narcotic antagonist, the patient's condition should become worse and require increased methadone hydrochloride; if it were to afford symptomatic relief by blocking autonomic responses, methadone requirements might be decreased. None of the studies indicated that propranolol hydrochloride in doses of 160 mg/day or less aggravated withdrawal symptoms. Ss treated with the drug consistently required a somewhat smaller methadone dose for detoxification, and those who responded favorably had mild withdrawal symptoms. The small benefit from the drug hardly merits its consideration as an adjunct to the treatment of withdrawal from opiates.—*Journal abstract*.

10109. **Horecker, Leonard.** (Illinois Security Hosp, Chester) **Chemotherapy and the behavioral disorder.** In L. M. Irvine, T. B. Brelje (Eds), *Law, psychiatry and the mentally disordered offender: I*. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.

10110. **Huussy, H. R.; Metoyer, Marie & Townsend, Marjorie.** (U Vermont, Coll of Medicine) **8-10 year follow-up of 84 children treated for behavioral disorder in rural Vermont.** *Acta Paedopsychiatrica*, 1974, Vol 40(6), 230-235.—84 children originally diagnosed as hyperkinetic and placed on psychopharmacologic therapy were followed up 8-10 yrs later. 18 had already been institutionalized in either a mental hospital or a correctional facility. Children diagnosed as hyperkinetic are considered to be seriously at risk for later difficulties.

10111. **Itil, T. M. et al.** (New York Medical Coll, NY) **New drug developments in the Netherlands: "Tetracyclic" psychotropic drugs.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 10-17.—Describes research on antiserotonin compounds, seeking minimum side effects for treatment of manic patients. A new group of tetracyclic compounds was developed. Trials in both depressed patients and in normal volunteers led to the

conclusion that GB-94 had significant antidepressive action and was similar to amitriptyline.

10112. **Jefferson, James W.** (U Wisconsin, Madison) **Beta-adrenergic receptor blocking drugs in psychiatry.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 681-691.—A review of the literature indicates that beta-adrenergic receptor blocking drugs have been employed in a variety of psychiatric conditions with variable success. The beta blockers appear to have an antianxiety action that is best established in the treatment of psychocardiac disorders but is less well defined with regard to other anxiety-related conditions. A paucity of studies comparing them with conventional anxiolytic drugs is one reason for not presently recommending their widespread use. As antipsychotic agents, the beta blockers have shown promise in studies that, at present, must be considered preliminary, while they clearly have potential as tools for investigating the neuropharmacology of psychosis. (123 ref)—*Journal abstract*.

10113. **Kielholz, P.** (U Basel, Psychiatric Clinic, Switzerland) **New psychotropic drug developments in German speaking countries.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 21-23.—Describes new psychotherapeutic drugs developed in Germany in the past 2 yrs. The antidepressant maprotilin (Ludiomil) has been demonstrated to be an incentive-increasing and mood-elevating drug without many of the side effects of antidepressants currently in use. The development of long-term neuroleptics is also cited.

10114. **Klawans, H. L. & Rubovits, R.** (Michael Reese Medical Ctr, Chicago, IL) **Effect of cholinergic and anticholinergic agents on tardive dyskinesia.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Aug), Vol 37(8), 941-947.—A study of 12 patients diagnosed as having tardive dyskinesia support the hypothesis that anticholinergic therapy in patients prone to develop the disorder may increase the incidence of it by lowering the threshold for the appearance of abnormal movements. Physostigmine improved these movements in tardive dyskinesia patients while scopolamine tended to aggravate abnormal movements and in some cases elicited abnormal movement not previously observed. It is suggested that tardive dyskinesia is primarily related to dopaminergic activity within the striatum. (23 ref)—*Journal abstract*.

10115. **Krager, John M. & Safer, Daniel J.** (Baltimore County Dept of Health, Towson, MD) **Type and prevalence of medication used in treating hyperactive children.** *New England Journal of Medicine*, 1974(Nov), Vol 291(21), 1118-1120.—Presents the results of a 1971 and 1973 survey on the use of medication for hyperactivity in elementary school children ( $N = 1,894$ ) in Baltimore County, Maryland. School nurses were asked to list the names of children receiving such medication, the name(s) of the drug(s), the reason for its administration, and the person who administered it. In 1971 in Baltimore County public schools, nurses reported that 1.07% of the children were on such medication. In 1973, this had increased to 1.73%. Results also show that in 1971, 76.2% of the children given medication for hyperactivity received stimulants (methylphenidate or dextroamphetamine), whereas by 1973 this had increased to 88.2%. A consistent finding was that children in

wealthier areas received medication more often than those in lower socioeconomic areas of the county.—*R. S. Albin*.

10116. **Lapierre, Y.-D.** (Hôpital Pierre-Janet, Hull, Québec, Canada) **[Sedatives, hypnotics and tranquilizers.]** (Fren) *Vie Médicale au Canada Français*, 1974(Jun), Vol 3(6), 605-609.—Reviews some of these substances with their indications and contraindications, and classifies them for practical use. (English summary)

10117. **LaRosa, John C.; Lipsius, Stephen H. & LaRosa, Judith H.** (George Washington U, Medical Ctr, Drug Dependence Program) **Experiences with a combination of group therapy and methadone maintenance in the treatment of heroin addiction.** *International Journal of the Addictions*, 1974, Vol 9(4), 605-617.—Describes a heroin addiction treatment program within a medical clinic which combines methadone maintenance and psychotherapy techniques. The majority of patients were Caucasian, employed, high school graduates and were all multiple drug abusers. Therapy sessions were led by mental health professionals or ex-addict counselors. After 1 yr, 23 of the original 42 patients (55%) remained in the program, 5 of whom were detoxified from methadone. Problems resulting from the use of ex-addicts as counselors are discussed in detail. Examples of the evolution of group progress in therapy illustrate the effective interrelationship of the 2 types of support in the treatment program.—*F. Beyer*.

10118. **Lipsitz, Phillip J. & Blatman, Saul.** (Mount Sinai School of Medicine, City U New York) **Newborn infants of mothers on methadone maintenance.** *New York State Journal of Medicine*, 1974(Jun), Vol 74(6), 994-999.—Studied the effects of methadone on 100 infants born to mothers maintained on high blocking doses of methadone. Although 56 infants exhibited narcotic withdrawal symptoms at birth, follow-up indicated normal physical and developmental growth during the first few months of life. (21 ref)

10119. **Lowe, Warren C. & Thomas, Sam D.** (VA Hosp, Shreveport, LA) **A comparison of three outcome measures of an alcoholic treatment unit.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 23-26.—Evaluated the success of an alcoholic treatment unit with 128 male alcoholics, using the criteria of job placement, total abstinence, and improved social functioning. 70% achieved 30-day successful job placement; 34% maintained total abstinence for 6 mo; and 62% showed improved social functioning after 6 mo.

10120. **MacDonald, James H. & Sparks, P. Don.** (McDonnell Douglas Corp, Personnel Development, St Louis, MO) **Employee assistance program for alcoholism and drug abuse: An industry approach.** *Industrial Gerontology*, 1974(Fal), NS, Vol 1(4), 25-27.—Describes a corporation's 4-yr employee assistance program designed to aid employees whose work performance was impaired by alcoholism or drug misuse. Key factors were identification of the problem, motivation to seek treatment, and referral to appropriate treatment services.

10121. **Neu, Carlos; DiMascio, Alberto & Williams, David.** (Boston State Hosp, MA) **Saliva lithium levels: Clinical applications.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 66-68.—Notes that, despite a few

reports in the literature indicating that saliva lithium levels could adequately replace serum determinations in monitoring patients being treated with lithium salts, this procedure has not received much clinical application. The present study of 20 patients investigated correlations between serum and mixed saliva and parotid fluid lithium levels and documented the reliability of this procedure. It is suggested that an individual patient's ratio of serum to saliva concentrations should be calculated and used as a constant in the determinations. Patients can collect saliva samples and send them to the laboratory prior to their visits, decreasing the facility's sample collection costs and the patients' inconvenience and discomfort.—*Journal abstract.*

10122. Pittel, Stephen M. & Hofer, Ricardo. (Wright Inst, Berkeley Ctr for Drug Studies, CA) **A systematic approach to drug abuse treatment referral.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 253-258.—Describes the Drug Abuse Treatment Referral System (DATRS). DATRS classifies drug abusers by their need for certain types of intervention and their ability to benefit from the alternative services available. The need is determined by indexing the nature and extent of the patient's drug involvement. A prognostic index assesses the personal and social resources available to the patient as shown by 4 scales: Achieved Stake (measures social ties and educational-vocational achievements), Duration of Drug Involvement, Treatment Commitment and Goals, and Current Cohabitants and Peers. Procedures are then used to select an optimal treatment mode. The use of DATRS to develop a community drug abuse plan is noted, and DATRS is viewed as an extension of the traditional mental health intake and referral process.—R. Tomasko.

10123. Pratt, Jesse W. (Tuum Est, Venice, CA) **Tuum Est (It's up to you).** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 179-184.—Reprints part of the Tuum Est therapeutic community program description and philosophy. The rationale is presented for Tuum Est's use of encounter groups, seminars, assigned readings, morning meetings, job assignments, rules, and daily log.

10124. Rimón, R. (U Kuopio, Finland) **Depression in rheumatoid arthritis.** *Annals of Clinical Research*, 1974(Jun), Vol 6(3), 171-175.—37 depressed female inpatients with definite or classical rheumatoid arthritis were treated with antidepressant drugs and supportive psychotherapy for a period of 3-8 wks. Rheumatological recovery was significantly more marked in those patients in whom clinical depression disappeared (as measured by the Beck Depression Inventory) than in patients with persistent depression throughout the relatively short therapy period. In most of the persistently depressed patients the clinical rheumatological state deteriorated or remained unchanged. The therapeutic regime proved beneficial in 57% of the patients, and both chlorimipramine and sulpiride seemed to be of comparable value in the treatment. The role of psychiatric consultations and therapy methods in the treatment of rheumatoid arthritis is discussed and evaluated. (27 ref)—*Journal abstract.*

10125. Rodin, E. A.; Rim, C. S. & Rennick, P. M. (Lafayette Clinic, Detroit, MI) **The effects of carbamazepine on patients with psychomotor epilepsy:**

**Results of a double-blind study.** *Epilepsia*, 1974(Dec), Vol 15(4), 547-561.—Conducted a study of the anticonvulsant and psychotropic properties of carbamazepine (Tegretol) with 37 16-55 yr old hospitalized patients with intractable psychomotor epilepsy. Patients were first stabilized on diphenylhydantoin and phenobarbital, 10-15 µg/ml in serum, and then received for 2 3-wk periods identical capsules containing either carbamazepine first, then placebo, or vice versa. Carbamazepine reduced the frequency of psychomotor seizures by 83%, and grand mal seizures by 55%. Side effects were minor except in 1 patient who developed transient leukopenia. Behavioral effects were not demonstrable on a double-blind basis. The drug tended to produce slowing of background EEG rhythms and sometimes diffuse paroxysmal activity. Carbamazepine appears to be effective for treatment of psychomotor epilepsy and is safe when blood and platelet counts are checked. (French, Spanish, & German summaries) (17 ref)—*Journal summary.*

10126. Rouleau, Yves. (Hôpital du Saint-Sacrement, Section de Psychiatrie, Québec, Québec, Canada) [The era of pharmacologic tranquility.] (Fren) *Vie Médicale au Canada Français*, 1974(Apr), Vol 3(4), 377-382.—Makes a case for better education in the use of tranquilizers. It is suggested that because of their lack of knowledge, susceptibility to advertisements, and psychological need to provide patients relief, doctors fail to prescribe tranquilizers responsibly. Patients, meanwhile, accept them passively as cures, are careless with dosage, and finally allow them to substitute for a real coming-to-terms with their problems. Although many substances have been used throughout history to relieve anxiety, the modern public ought to be encouraged to more self-reliance through education.—L. Klinkon.

10127. Rybakowski, Janusz et al. (Medical Academy of Poznań, Psychiatric Clinic, Poland) **Red blood cell lithium index in patients with affective disorders in the course of lithium prophylaxis.** *International Pharmacopsychiatry*, 1974, Vol 9(3), 166-171.—Estimated the red blood cell (RBC) lithium index (RBC lithium to serum lithium ratio) in 37 17-67 yr old patients with affective disorders in the course of lithium prophylaxis during 4 mo. The study revealed no difference in RBC lithium index between patients with manic-depressive psychosis and unipolar depression, nor between men and women. RBC lithium index was to some extent correlated with the magnitude of serum lithium concentration. The variability of RBC lithium index with time was different (+/- 2- +/- 50%) in different patients. The possible importance of RBC lithium index in affective disorders is critically discussed.—*Journal abstract.*

10128. Škopková, H. (Psychiatrická léčebna, Dobřany, Czechoslovakia) [Psychotic complications after tetraethylthiuram disulfide used in the treatment of alcoholism.] (Czec) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 102-111.—Describes 29 clinical cases of psychosis detected among 1,348 chronic alcoholics treated with antabuse. The psychotic period generally occurred after 35 days of medication and its average length was 21 days. The clinical picture was characterized by disorders of thinking, bizarre delusions, illogical speech, disturbance of mood and affect, aggressiveness, delirium, clouding of consciousness, and high variability

and frequent change of symptoms. More than half of the psychoses were directly related to antabuse alcohol reaction. Most of the cases were not volunteers but had been forced to submit to the treatment. It is hypothesized that antabuse psychoses have different etiologies, including that of overmedication. Anamnestic and katamnestic data are analyzed in order to gain better understanding of the complex phenomenon. (Russian & English summaries) (15 ref)—*V. Fischmann*.

10129. **Sack, Michael.** (Winnebago Mental Health Inst, Drug Abuse Treatment & Community Consultation Unit, WI) **Therapeutic community movement.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 169-171.—Describes the development of the therapeutic community approach to the treatment of drug abuse. Issues presented at the 1973 Wingspread Conference about the future of the movement are discussed.

10130. **Sack, Robert L. & Goodwin, Frederick K.** (Stanford U, Medical School) **Inhibition of dopamine- $\beta$ -hydroxylase in manic patients: A clinical trial with fusaric acid.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 649-654.—Studied the behavioral effects of fusaric acid, a specific inhibitor of dopamine- $\beta$ -hydroxylase (DBH) under double-blind conditions in 9 manic patients. Fusaric acid administration was associated with a significant decrease in cerebrospinal fluid 3-methoxy-4-hydroxy-phenylglycol (the major metabolite of norepinephrine) and an increase in homovanillic acid (the major metabolite of dopamine), changes consistent with central DBH inhibition. Behavioral effects of fusaric acid appeared to depend on the preexisting clinical state. Ss with more severe mania, including evidence of preexisting psychotic features, became consistently worse (more psychotic), while Ss with mild hypomanic symptoms showed no change or slight improvement. Conventional anti-manic therapies, initiated after the fusaric acid protocol, were associated with improvement in the expected time period in all Ss. (58 ref)—*Journal abstract*.

10131. **Sampliner, Richard & Iber, Frank L.** (VA Hosp, Baltimore, MD) **Diphenylhydantoin control of alcohol withdrawal seizures: Results of a controlled study.** *JAMA: Journal of the American Medical Association*, 1974(Dec), Vol 230(10), 1430-1432.—Diphenylhydantoin (300 mg/day) or placebo were blindly administered for 5 days to 157 patients entering an alcoholism detoxification unit; all patients received sedative doses of chlorthalidone. All patients had a history of convulsions in adulthood. 11 patients in the placebo-treated group but none in the diphenylhydantoin group had convulsions in the 1st 48 hrs. 2 patients had convulsions after withdrawal of active drug. Blood levels of diphenylhydantoin were determined in 18 alcoholics and in 5 normal Ss. Comparable blood levels (3 $\mu$ g/ml) were obtained in both groups after the 1st day and reached a plateau of 4 $\mu$ g/ml after the 3rd.—*Journal abstract*.

10132. **Schecter, Arnold.** (State U New York, Downstate Medical Ctr, Brooklyn) **Consumer acceptance of drug abuse programs: A provider's view.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 213-223.—Discusses consumer reaction to drug abuse treatment programs. Modalities considered include methadone, drug-free narcotic antagonists (nalorphine, cyclazocine, naloxone, and naltrexone), and long-acting methadone.

The single treatment mode approach of most drug programs is criticized, and the lack of a consumer orientation in most programs is noted. The need for realistic, ongoing vocational and emotional assistance for addicts and ex-addicts is stressed. (32 ref)—*R. Tomasko*.

10133. **Schwartz, Martin S. & Scott, D. F.** (Academic Hosp, Uppsala, Sweden) **Aminophylline-induced seizures.** *Epilepsia*, 1974(Dec), Vol 15(4), 501-505.—Presents case histories of 4 patients, all over 40 yrs of age, with a long history of bronchial asthma but no previous epilepsy, who developed serial seizures with focal onset during treatment of status asthmaticus. Seizures appeared to be related to the administration of aminophylline. (French & German summaries)

10134. **Simeon, J.; Utech, C.; Simeon, S. & Itil, T. M.** (U Missouri, Medical School, Inst of Psychiatry, St Louis) **Pediatric psychopharmacology outside the USA.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 37-47.—Describes research designed to obtain data on the use of psychotropic drugs in children outside the US. Questionnaires were sent to 251 institutions in 53 countries. 73 of these were returned from 34 countries and were analyzed. The percentage of patients receiving drugs under the care of these respondents ranged from 0 to 100% (mean of 39%). A total of 56 different drugs were administered for 11 psychiatric disorders. No regional differences were apparent, except for infrequently used drugs. The most popular drugs in use were diazepam, thioridazine, chlorpromazine, chlorthalidone, imipramine, amitriptyline, haloperidol, and methylphenidate. Highest agreements among respondents were for imipramine in enuresis, diazepam in anxiety, chlorpromazine in psychosis, and thioridazine in hyperkinesia. Major problems in interpreting cross-cultural data in pediatric psychopharmacology are elucidated by interpretation of study results.—*R. S. Albin*.

10135. **Siris, J. H.; Pippenger, C. E.; Werner, W. L. & Masland, R. L.** (Creedmore State Hosp, Section of Neurological Services, Queens Village, NY) **Anticonvulsant drug-serum levels in psychiatric patients with seizure disorders.** *New York State Journal of Medicine*, 1974(Aug), Vol 74(9), 1554-1556.—Studied the effects of psychotropic drug therapy on the serum anticonvulsant drug levels of psychiatric patients with major motor seizure disorders. The serum anticonvulsant levels of 18 Ss receiving diphenylhydantoin (DPH) and phenobarbital, and of 24 Ss receiving DPH, phenobarbital, and 1 psychotropic drug (chlorpromazine, diazepam, or thioridazine) were determined by gas liquid chromatography. It was found that all Ss had optimal therapeutic levels of serum phenobarbital, but that Ss receiving a psychotropic drug in addition to anticonvulsant drugs showed wide variations in serum DPH levels. It is concluded that effective seizure control in psychiatric patients may be frustrated by the use of psychotropic drugs which interfere with the utilization of anticonvulsant drugs. (15 ref)—*J. Kelly*.

10136. **Sirotnik, Ken.** **A comprehensive evaluation model for multimodality programs in the treatment of drug abuse.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 259-268.—Describes an evaluation model appropriate for multimodal drug treatment programs. Separating the evaluation concept from measurement per se, a 3-

dimensional data box is described which distinguishes evaluation phases, objects, and functions. (17 ref)

10137. **Smith, David E.; Linda, Lauren K. & Loomis, Stuart.** (Haight-Ashbury Free Medical Clinic, San Francisco, CA) **Experiences of the Haight-Ashbury Free Medical Clinic's community based drug rehabilitation program.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 243-251.—Describes the development of services provided by the clinic. The restoration of a drug abuser's previous level of social and vocational skills through intensive counseling and an apprenticeship program is discussed. (19 ref)

10138. **Stokes, Trevor F.; Baer, Donald M. & Jackson, Robert L.** (U Kansas) **Programming the generalization of a greeting response in four retarded children.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 599-610.—Used reinforcement techniques of prompting and shaping to develop handwaving in 4 10-13 yr old institutionalized retarded Ss. A multiple-baseline design across Ss demonstrated the reliable functioning of the training procedures. Specifically, it showed that training and maintenance of the greeting response by 1 E was not usually sufficient for generalization of the response to the more than 20 other members of the institution staff who had not participated in the training of the response. However, high levels of generalization to staff members were recorded for 3 Ss over periods ranging from 1 to 6 mo after a 2nd E trained and maintained the response in conjunction with the 1st E. The 4th S, although never receiving training by a 2nd E, showed similar results following a 2nd training by the 1st E.—*Journal abstract.*

10139. **Swazey, Judith P.** (Boston U, Medical School) **Chlorpromazine in psychiatry: A study of therapeutic innovation.** Cambridge, MA: MIT Press, 1974. xiv, 340 p. \$17.50.—Discusses the routes of development and history of chlorpromazine (CPZ), the events that led to CPZ's current prominent place in clinical psychiatry, its effects on hospital psychiatry in the US, and the history of the National Institute of Mental Health collaborative controlled study of CPZ and acute schizophrenia. (24 p ref)

10140. **Sweet, Richard D.; Bruun, Ruth; Shapiro, Elaine & Shapiro, Arthur K.** (New York Hosp, NY) **Presynaptic catecholamine antagonists as treatment for Tourette syndrome: Effects of alpha methyl para tyrosine and tetrabenazine.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 857-861.—Improvement of the tic syndrome of Gilles de la Tourette by haloperidol suggests that brain dopaminergic functions may be hyperactive in this condition. The role of catecholamines in Tourette syndrome was tested by administration to 7 15-34 yr old patients of alpha methyl para tyrosine (MPT), which inhibits synthesis, or tetrabenazine, which inhibits storage of brain catecholamines. 2 patients improved with each medication but only 1 each enjoys sustained benefit. Adverse effects were drug crystalluria with MPT and extrapyramidal effects with both medications. Intravenously given cholinergic and anticholinergic medication had no consistent effect on tics. The MPT and tetrabenazine are not satisfactory medications, but their effects suggest that brain catecholamines may be important in Tourette syndrome. (21 ref)—*Journal abstract.*

10141. **Swett, Chester.** **Adverse reactions to chlorpromazine in psychiatric patients.** *Diseases of the Nervous System*, 1974(Nov), Vol 35(11), 509-511.—Reports adverse reactions in 150 out of 470 consecutively monitored psychiatric inpatients. Mean age of patients was 36 yrs and 48% were male. In 3 of these 150 patients, these reactions were considered life-threatening (0.6%). Reactions were more frequent with higher daily doses and the intramuscular route was associated with earlier onset of a reaction. The central nervous system was most often affected. The dystonias occurred more often in males and after a shorter duration of treatment than the other types of extrapyramidal reactions. In contrast, akathisia occurred later in treatment and was observed more often in females. Drowsiness was the 2nd most common type of reaction. In addition, hypotensive reactions occurred in 7 cases and have been suggested to occur via depression of central vasomotor centers as well as by autonomic mechanisms. It is suggested that clinicians weigh the potential risk vs therapeutic efficacy in prescribing this drug.—*R. S. Albin.*

10142. **Tennant, Forest S.; Russell, Barbara A.; McMarns, Alladia & Cassas, Mary K.** (U California, Medical School, Los Angeles) **Propoxyphene napsylate treatment of heroin and methadone dependence: One year's experience.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 201-211.—Describes the use of propoxyphene napsylate (Darvon-N) in a Los Angeles heroin addiction treatment program as an alternative to methadone. Treatment procedures, toxicological effects, effects on physiologic and social functions, and interaction with other psychoactive drugs are discussed. Propoxyphene napsylate's low physical addiction liability and its minimal effects on sexual functions are noted as factors improving its patient and community acceptability. The drug is indicated to be useful for the detoxification of heroin and methadone dependent individuals as well as a short-term maintenance agent for heroin addicts.—*R. Tomasko.*

10143. **Tucker, Jerry R.** **A worker-oriented alcoholism and "troubled employee" program: A union approach.** *Industrial Gerontology*, 1974(Fal), NS, Vol 1(4), 20-24.—Describes a state cooperative alcoholism program that focuses on establishing employer agreements designed to recognize, refer to treatment, rehabilitate, and re-employ alcoholically troubled workers.

10144. **Van Dusen, Wilson & Sherman, Scott L.** (Awareness House Training Ctr, Oakland, CA) **Cultural therapy: A new conception of treatment.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 173-177.—Describes a treatment approach based on the unearthing of a drug abusing individual from his/her drug abusing subgroup. The importance of peer group pressure in learning and breaking from drug dependency is stressed. Conventional psychotherapy is contrasted to cultural therapy, and common approaches used by cultural therapy groups are outlined. Conventional therapy is considered more appropriate for drug abusers outside the drug culture. Cultural therapy is indicated to be appropriate for juvenile delinquents, victims of chronic poverty, criminals, alcoholics, and homosexuals. (25 ref)

—*R. Tomasko.*

10145. Van Stone, William W. (Stanford U, Medical School) **Treating the drug-dependent veteran: Perspective from a Veteran Administration hospital.** *International Journal of the Addictions*, 1974, Vol 9(4), 593-604.—Describes the development of a drug rehabilitation program, consisting of a detoxification ward, 2 methadone clinics, and 3 residential settings. Specific problems involved in initiating a drug program are discussed.

10146. Viol, Geoffrey W.; Grof, Paul & Daigle, Lesley. (St Joseph's Hosp, Hamilton, Ontario, Canada) **Renal tubular function in patients on long-term lithium therapy.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 68-70.—Conducted a study in which 10 female patients (mean age, 50.3 yrs) with recurrent affective disorders who responded completely to long-term lithium therapy but who were otherwise unselected were tested for renal tubular concentrating and acidification ability. Despite frequent symptoms of thirst, polyuria, and nocturia, all patients were able to concentrate urine normally, and all showed normal renal tubular acidification ability. A significant correlation was found between erythrocyte lithium concentration and maximum urinary osmolality ( $r = .67$ ,  $p < .05$ ). (20 ref)—*Journal abstract*.

10147. Waldmann, K.-D. et al. (Universitäts-Nervenklinik, Jena, E Germany) [Lithium-serum concentration within therapeutic levels causing toxic symptoms.] (Germ) *Psychiatria Clinica*, 1974, Vol 7(1), 56-62.—Reports toxic manifestations occurring during prophylactic lithium treatment of a woman with periodic depressions. They appeared as neurological and gastrointestinal symptoms as well as an organic psychosyndrome while the serum lithium level was within therapeutic levels. The connection of the earlier-mentioned symptoms and the lithium therapy could be established; the organic psychosyndrome appeared also to be due to the lithium. Particular aspects of the relations between lithium dosage and lithium serum levels, as well as changes in the potassium serum levels for the entire time of the treatment, are described and discussed.—*English abstract*.

10148. Walsh, Arthur C. & Lukas, Emma. **Alcoholic brain damage: Anticoagulant therapy.** *Journal of the American Geriatrics Society*, 1974(Dec), Vol 22(12), 555-556.—Anticoagulant therapy with bishydroxycoumarin (Dicumarol) was given for 5-6 wks to 15 hospital patients with organic brain damage secondary to alcoholism. Results were excellent in 5, good in 7, and poor in 3 cases; 8 patients were discharged.

10149. Wesson, Donald R. & Smith, David E. (West Coast Polydrug Abuse Treatment & Research Project, San Francisco, CA) **A conceptual approach to detoxification.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 161-168.—Discusses 9 principles to guide the management of drug withdrawal states. Strategies are presented for directing withdrawal from opiates, sedative-hypnotics, mixed alcohol/sedative-hypnotic dependence, mixed opiate/sedative-hypnotic dependence, Darvon (propoxyphene) and Talwin (pentazocine).

10150. Wheatley, David. (General Practitioner Research Group, Twickenham, England) **New drug development in United Kingdom.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7, Sect 2), 24-27.—Discusses

alternative drugs currently in use in Great Britain due to the impasse reached with more conventional psychotropic drugs. The uses of beta-blocking drugs in anxiety (e.g., propranolol) are reviewed. The uses of thiazide diuretics in depression, and some new antidepressants (e.g., vivalan) are also examined.

10151. Zarcone, Vincent P. & Hoddes, Eric. (Stanford U) **Effects of 5-hydroxytryptophan on fragmentation of REM sleep in alcoholics.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 74-76.—Studied the effects of oral loading with 5-hydroxytryptophan (5-HTP) on REM fragmentation in a group of 12 25-52 yr old male alcoholics who were abstinent following acute ethanol withdrawal. Decreased fragmentation was found in the majority of Ss, and those Ss with low baseline REM efficiency (i.e., greater fragmentation) showed more improvement from the drug than did Ss who were less impaired initially. It is suggested that there is an organic decrement of serotonin during ethanol withdrawal which is partially reversed by 5-HTP loading.—*Journal abstract*.

### Behavior & Group Therapy

10152. Abramowitz, Christine V.; Abramowitz, Stephen L.; Roback, Howard B. & Jackson, Carolyn. (George Peabody Coll for Teachers) **Differential effectiveness of directive and nondirective group therapies as a function of client internal-external control.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 849-853.—Tested the predictive utility of a Client x Modality interactive model for group psychotherapy outcome. 26 mildly distressed college student clients were assigned randomly to a nondirective or to 1 of 3 directive groups, all led by the same therapist. Belief in personal internal-external control (assessed with Rotter's Internal-External Control Scale) was the individual-difference predictor, and a multivariate personality battery (including the State-Trait Anxiety Inventory and the Rosenberg Self-Esteem Scale) provided the indexes of psychosocial adjustment. As hypothesized, more internally oriented persons were more therapeutically responsive to the nondirective than to the directive approach, whereas the reverse tended to be the case among those more externally oriented. (29 ref)—*Journal abstract*.

10153. Aponte, Harry J. (Philadelphia Child Guidance Clinic, PA) **Organizing treatment around the family's problems and their structural bases.** *Psychiatric Quarterly*, 1974, Vol 48(2), 209-222.—Describes a therapeutic process in which the therapist helps members of a family system to (a) agree on the problem they need to solve, (b) identify the participants in the family structure to which the problem is related, and (c) make pledges to work on changing the structural basis of the newly-clarified problem. This approach is based on the frequent discovery that a patient is not actually sick, but is simply reacting to pathology in the family constellation.—*Journal abstract*.

10154. Arkowitz, Hal. (U Oregon) **Desensitization as a self-control procedure: A case report.** *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 172-174.—Describes the effective use of self-desensitization in a case of social and sexual anxieties. The client

conducted the desensitization himself, with the therapist serving as "technical consultant." Details of the treatment and outcome, and of a 2½-yr follow-up are presented.

10155. Ausman, James; Ball, Thomas S. & Alexander, Dean. (Pacific State Hosp, Intensive Behavioral Intervention Ward, Pomona, CA) **Behavior therapy of pica with a profoundly retarded adolescent.** *Mental Retardation*, 1974(Dec), Vol 12(6), 16-18.—Used a 4-phase time-out procedure to treat a nonverbal 14-yr-old severely retarded, ambulatory male, who had a lengthy history of pica. Results indicate that after 9 mo of treatment, S's pica had been contained to a significant degree.

10156. Azrin, N. H. & Wesolowski, M. D. (Anna State Hosp, Behavior Research Lab, IL) **Theft reversal: An overcorrection procedure for eliminating stealing by retarded persons.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 577-581.—To deal with the problem of stealing, an overcorrection procedure was designed in which the thief was required to give his victim an item identical to the stolen one in addition to returning the stolen item. This procedure was compared with the more commonly used simple correction procedure (restitution) in which the thief is required to return the stolen item. Under the simple correction procedure, an average of 20 thefts/day had been occurring among 34 retarded residents of an institution. The overcorrection procedures reduced the thefts by 50% on the 1st day, by 75% on the 2nd day, and eliminated thefts by the 4th day, after which no further stealing occurred. The overcorrection procedure was a rapid and effective method of eliminating stealing, it provided special consideration for the victim, and it should be applicable to the nonretarded.—*Journal abstract.*

10157. Boër, Annette K. & Lantz, James E. (Family Counseling Ctr, Columbus, OH) **Adolescent group therapy membership selection.** *Clinical Social Work Journal*, 1974(Fal), Vol 2(3), 172-181.—Discusses the following considerations for selecting adolescent group members: (a) The teenager should be experiencing difficulties outside of the family. (b) All potential group members and their parents should be seen at least once by the group therapist(s) to develop a beginning relationship. (c) The group should be balanced in terms of interactional styles and sex. (d) The age span should be small. (e) Case responsibility should rest with the group therapist(s). 2 groups are described to illustrate the importance of careful membership selection.—S. R. Stein.

10158. Bond, James A. (Chicago Counseling & Psychotherapy Research Ctr, IL) **Behavior therapy: learning theory and scientific method.** *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 118-132.—Discusses distinctive contributions of behavior therapy in the light of 2 basic and complex notions used in previous appraisals: "learning theory" and "scientific method." Properly analyzed, these 2 notions contain the best basis for understanding what is distinctive about behavior therapy in comparison with psychoanalytic and client-centered therapies. Reappraisal of "learning theory" and "scientific method" (in terms of T. S. Kuhn's notion of a "disciplinary matrix") reveals 2 fundamental aspects—the stimulus-organism-response

model as heuristic, and the methodological value placed on publicly observable behavior. It is argued that this model and value give rise to behavior therapy's distinctive contributions: exploration of new domains of data, stress on greater specificity in terminology, and more extensive and fruitful use of all stages of scientific inquiry, especially the early stages.—*Author abstract.*

10159. Bruch, Hilde. (Baylor Coll of Medicine, Houston, TX) **Perils of behavior modification in treatment of anorexia nervosa.** *JAMA: Journal of the American Medical Association*, 1974(Dec), Vol 230(10), 1419-1422.—In recent years, overly optimistic claims have been made for the efficacy of behavior modification in the treatment of anorexia nervosa. This claim rests on the mistaken assumption that enforced correction of the emaciation, the most prominent symptom, represents meaningful treatment of this serious and complex condition. Results have been published without the benefit of follow-up studies. The cases of 3 17-20 yr old females are reported in which this method led to deterioration. In spite of bringing about a transient weight increase, behavior modification must be looked upon as potentially damaging in anorexia nervosa.—*Journal abstract.*

10160. Buda, Béla. [Strategy and tactics in group psychotherapy.] (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(5), 301-324.—Stresses the need for strategy and tactics in group psychotherapy. In each group an observation period at the beginning may provide necessary information for planning group activities. Strategic and tactical thinking is useful for intensifying the group process and increasing its effectiveness. Experience with 7 major types of groups: neurotic, Balint, alcoholic, juvenile drug addiction, acute and chronic schizophrenic, and training groups—illustrates the development of various strategies and tactics. Increased activity, the use of different therapeutic methods and theories, and shortening the therapeutic process do not contradict the principles of psychoanalytic group therapy. H. Brundl.

10161. Cacirol, L. et al. (U Rome, Italy) **Family psychotherapy with a case of a depressed woman: Reflections on Sigmund Freud's concept of "mourning and melancholia."** (Ital) *Rivista di Psichiatria*, 1974(Spr), Vol 9(3), 185-202.

10162. Chopra, H. D. (Geelong Psychiatric Ctr, Australia) **Obsessive compulsive neurosis and behavior therapy.** *Indian Journal of Clinical Psychology*, 1974(Mar), Vol 1(1), 19-22.—Discusses obsessive-compulsive neurosis, emphasizing the relevance of a learning theory model to symptom development and treatment. In the behavioral treatment model presented, a relationship between duration of obsessional behavior and focus of behavioral treatment is emphasized. For acute cases of short duration, desensitization to anxiety-provoking stimuli is appropriate, while for cases of long duration an attack on the obsessional behavior is more appropriate. Systematic desensitization and thought-stopping techniques are briefly described, and the use of these techniques in 4 cases of obsessive-compulsive disorders illustrates the successful treatment of recent and long-standing obsessions.—F. S. Beyer.

10163. Chopra, H. D. **Treatment of encopresis in a mongol with operant conditioning.** *Indian Journal of Mental Retardation*, 1973(Jan), Vol 6(1), 43-46.—Describes the case of an 11½-yr-old boy with Down's syndrome who developed a problem of encopresis associated with a change in his school environment. The patient was encouraged by the parent and teacher to sit on the toilet seat in the morning and was rewarded if he defecated. No punishments were used. He showed improvement after 6 wks of consistent training and after 5 mo was fully retrained.—J. H. Pflaum.

10164. Dube, K. C. & Yadav, B. S. (SN Medical Coll, Agra, India) **Role of sympathy and attention in treating deteriorated behavior: An experience in behavior technique.** *International Mental Health Research Newsletter*, 1974(Sum), Vol 16(2), 9-11.—Studied effectiveness of sympathy and attention in treating mental hospital patients considered therapeutic failures. Ss were 10 chronically psychotic male patients hospitalized for more than 5 yrs, who were serious management problems. During 1969-1970, Ss experienced 6 mo of treatment which included separate, pleasanter living quarters, nurses selected as particularly sympathetic, and encouragement to assume responsibility for their own care. Ratings of behavioral abnormalities were made before treatment, in mid-treatment, immediately after and 6 mo after treatment. Immediate results showed marked improvement in 5 of the 9 Ss completing treatment, fair improvement in 1, and slight improvement in another. 2 showed no improvement. 4 of the 7 improved Ss maintained gains at 6-mo follow-up. Symptom improvement occurred in almost all areas except feeding and speech problems. Treatment success is attributed to the reinforcing value of kindness and encouragement; wider and more consistent use of such treatment is recommended.—C. A. Heikkinen.

10165. Eysenck, H. J. (Inst of Psychiatry, London, England) **The use of conditioning methods in psychiatry.** *Indian Journal of Clinical Psychology*, 1974(Mar), Vol 1(1), 41-52.—Discusses the principles and applications of behavior therapy in the treatment of neurotic disorders. The methods of treatment in behavior therapy are based on classical and operant conditioning. Classical conditioning techniques (e.g., desensitization, flooding, modeling, and aversion therapy) are most effective when emotional dysfunction such as anxiety is the basis of the disorder. In contrast, operant conditioning techniques (e.g., a token economy and the direct application of operant principles) are most effective when dealing more specifically with behaviors such as headbanging. Examples illustrating the success of the various methods of treatment are presented, emphasizing their superiority over psychoanalytic methods. Behavior therapy is also evaluated in terms of responses to common criticisms.—F. S. Beyer.

10166. Flannery, Raymond B. (Somerville Mental Health Ctr, MA) **Behavior modification of geriatric grief: A transactional perspective.** *International Journal of Aging & Human Development*, 1974(Spr), Vol 5(2), 197-203.—Describes a behavior modification program used in treating grief in a 77-yr-old organically impaired, single white male patient. The program, carried out in a community mental health setting, is discussed in terms of

transactional analysis (TA). The successful application of behavioral assessment and treatment techniques to TA was demonstrated by changes in the quality and amount of adaptive behavior shown by the patient over a period of 6 mo. (25 ref)—*Journal abstract*.

10167. Flowers, John V. & Guerra, Julio. (U California, Program in Social Ecology, Irvine) **The use of client coaching in assertion training with large groups.** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 414-417.—Compared the use of professionals and clients as coaches in assertion training. 27 probation officers were placed in 1 of 3 experimental conditions in the behavioral rehearsal portion of such training. In these conditions Ss served as clients coached by nonprofessionals (other Ss), clients coached by professionals, or both clients and coaches. 2 outcome measures were used: (a) the client's later selection of the correct assertion strategy to maximize the chances of success in a specific situation and (b) the client's later performance of the assertion response with a minimum need for coaching. Results indicate that nonprofessional coaching was superior to professional coaching in 2 regards: (a) an S coached by a fellow client was superior in later assertion performance than one who was coached by a professional. (b) An S who had been a coach learned assertion techniques better than an S who had never had the opportunity to coach. It is suggested that employing nonprofessional client-coaches may be an effective method of delivering at least 1 form of mental health service in a way that most effectively uses both professional and client time.—*Journal abstract*.

10168. Friedman, Meredith L. & Dies, Robert R. (U Maryland) **Reactions of internal and external test-anxious students to counseling and behavior therapies.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 921.—Studied the responses of 36 test-anxious students, who differed on Rotter's Internal-External Control Scale, to 3 forms of therapy (counseling, systematic desensitization, and automated desensitization). Support was obtained for the prediction that internal Ss would show greater resistance to the control implied in the 2 behavior therapies than external Ss.

10169. Fryrear, Jerry L.; Nuell, Leon R. & Ridley, Susan D. (Tulane U) **Photographic self-concept enhancement of male juvenile delinquents.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 915.—Describes the enhancement of self-concepts of 16 13-16 yr old male juvenile delinquents using a program of photographic feedback about themselves. According to their Tennessee Self-Concept Scale scores, Ss who received the weekly photographic feedback sessions, compared to 14 controls increased in total self-concept, self-satisfaction, and the use of psychological defenses necessary for the maintenance of self-esteem.

10170. Gilandis, Alex J. (James Cook U, Townsville, Qld, Australia) **The application of broad spectrum behavior therapy to a patient with multi-dimensional problems.** *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 179-181.—Presents the case of an institutionalized patient who received a broad spectrum of behavioral therapy. Environmental manipulation, token economy, modeling, cognitive conditioning, and medication alleviated a wide range of behavioral

excesses, bizarre thoughts, and inappropriate emotional responses in a 45-yr-old woman diagnosed as a chronic schizophrenic.

10171. Goldsmith, Jean B. & McFall, Richard M. (Illinois State Psychiatric Inst, Chicago) **Development and evaluation of an interpersonal skill-training program for psychiatric inpatients.** *Journal of Abnormal Psychology*, 1975(Feb), Vol 84(1), 51-58.—Experimentally evaluated an empirically developed interpersonal-skill-training program for male psychiatric inpatients. The program development phase involved identifying patient-relevant problem situations, analyzing effective responses for these situations, deriving principles governing such effective behavior, and developing explicit scoring criteria for such behavior. In the evaluation phase, 36 male psychiatric inpatients received 3 individual sessions of either interpersonal skill training or pseudotherapy, or they were in an assessment-only control group. Skill training was superior to the other 2 conditions on a number of behavioral and self-report measures, both in the training context and in a more real-life context.—*Journal abstract.*

10172. Granger, James A. (Walter Reed Hosp, Child Guidance Service, Washington, DC) **Including the younger child in conjoint family evaluation and therapy.** *Psychiatric Forum*, 1974(Fal), Vol 4(2), 21-26.—Presents a conceptual model for family therapy, identifying those processes occurring in healthy and problem families. Emphasis is placed on family therapy for families with young children (3-10 yrs) and on the need to modify traditional methods of evaluation and treatment in these cases. An evaluative approach, based on the conjoint structured interview, is modified to include 5 tasks which ensure a child's participation. The main modification in treatment is the introduction of play materials, which facilitate child expression and reduce anxiety. Suggestions to increase the therapist's effectiveness in evaluation and treatment, such as useful techniques to facilitate change in a family's level of functioning, are discussed.—*F. Beyer.*

10173. Guidry, Lawrence S. (VA Hosp, New Orleans, LA) **Treatment of a case of compulsive stealing by use of a covert aversive contingency and the Premack principle.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 27-28.—Reports the case of a white male in his 20s whose long-standing stealing behavior was brought under control and virtually eliminated after 7 treatment sessions. A 10-mo follow-up indicated that the improvement had been maintained.

10174. Guidry, Lawrence S. (VA Hosp, New Orleans, LA) **Drug patient evaluation of a self directed behavior modification program.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 29-30.—Describes a behavior modification program applied to over 100 addicts, more than 20 completing all sessions. A 6-mo evaluation by the patients indicates enthusiastic acceptance and high ratings based on questionnaire data.

10175. Guidry, Lawrence S. (VA Hosp, New Orleans, LA) **Treatment of a case of claustrophobia by graded "in vivo" desensitization.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol

16(2), 28-29.—Reports the case of a 45-yr-old white male with a history of drug and alcohol abuse. S had a long-standing fear of closed places and many related anxieties. As measured on a subjective scale from 0 to 100, anxiety levels on all relevant dimensions were approaching zero at the end of treatment. Follow-up observations confirmed sustained improvement.

10176. Hall, Sharon M.; Hall, Robert G.; Hanson, Richard W. & Borden, Betty L. (U California, Langley-Porter Neuropsychiatric Inst, San Francisco) **Permanence of two self-managed treatments of overweight in university and community populations.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 781-786.—Assigned 94 males and females from community and university samples (mean ages = 20.8 and 42 yrs, respectively) to 2 self-management treatments, nonspecific, or no-treatment controls. At post-treatment, self-management conditions differed from controls in percentage of overweight lost. At 3-mo follow-up, the simpler self-management procedure differed from the nonspecific control on both dependent variables. The more complex self-management treatment differed only on percentage of body weight lost. At 6-mo follow-up, differences were not significant. Treatments  $\times$  Time of Assessment analysis on body weight indicated a significant interaction and significant losses during treatment and gains during posttreatment for both self-management conditions. (19 ref)—*Journal abstract.*

10177. Helsing, G. & Wolff, E. (Psychosomatische Universitätsklinik, Giessen, W Germany) **[Countertransference and sociometric group structure: iatrogenic structuring of closed subgroups within an open patient group.]** (Germ) *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1974(Jan), Vol 24(1), 1-12.—Studied an open therapy group of patients 20-40 yrs old for 4 yrs in terms of group dynamics. The use of sociograms revealed the structure of the group and the countertransference of the therapists. A "star" subgroup and an opposition subgroup were identified. The star group characterized itself as being liked, capable, and relatively sound. They took over the therapeutic functions and were supported in this role by the group therapists. The opposition group regarded itself as ill and disturbed and was treated by the star group. Literature about role differentiation in neurotic groups is discussed. Results suggest that open groups offer conditions for developing a therapeutic social mobility within the group.—*S. D. Babcock.*

10178. Helsing, Gerd. (Psychosomatic Clinic, Giessen, W Germany) **[Active clinical therapy used with a group of phobics from a specific social class.]** (Germ) *Praxis der Psychotherapie*, 1973(Jun), Vol 18(3), 97-103.

10179. Hogg, J. & Maier, I. (U Manchester, Hester Adrian Research Ctr, England) **Transfer of operantly conditioned visual fixation in hyperactive severely retarded children.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 305-310.—Following operant conditioning of visual fixation responses to objects of known preference, 10 hyperactive, severely retarded 6-10 yr old children were given a series of transfer tests: (a) a distracting testroom, (b) neutral (unconditioned) stimuli, (c) E replacement, (d) simple play tasks presented in the testroom and the classroom, (e) Seguin formboard, (f)

beat manipulation, and (g) classroom assessment involving prescribed tasks. Results show consistent improvement for most Ss in the majority of tests for frequency and duration of visual fixation. No improvement was shown on the Seguin formboard, and a significant practice effect was obtained on the bead manipulation task.—*Journal abstract.*

10180. Hudson, R. Lofton. **Married love in the middle years.** *Journal of Religion & Health*, 1974(Oct), Vol 13(4), 263-274.—Describes cases encountered while counseling families in a religiously oriented program. It is maintained that boredom and a lack of social controls from growing children often cause a drifting apart and loss of sexual interests in married middle-aged couples. Making new friends and developing mutual hobbies are suggested as effective methods to combat the anxiety of increasing age and situations where divorce is not an alternative.—*F. A. Hardt.*

10181. Kapche, Robert. (California State U, Long Beach) **Aversion-relief therapy: A review of current procedures and the clinical and experimental evidence.** *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 156-162.—Reviews the literature relevant to aversion-relief therapy, which attempts to teach clients to inhibit anxiety by pairing selected stimuli with the cessation of noxious stimulation. Clinical reports describe the 4 types of procedure that have been reported in experiments with both humans and animals. This therapy appears promising, although the clinical reports suffer from the lack of controls and small samples of Ss. The animal research indicates the importance of the temporal length of the "safe" period between stimuli presentations. This factor has not been considered very crucial in many of the clinical applications.—*C. P. McCreary.*

10182. Kassirer, Lynn B. (George Washington U, National Law Ctr) **Behavior modification for patients and prisoners: Constitutional ramifications of enforced therapy.** *Journal of Psychiatry & Law*, 1974(Fal), Vol 2(3), 245-302.—Describes learning theory and techniques of behavior modification. Issues raised by coerced behavior therapy on prisoners and mental patients are discussed, as well as relevant case laws. (17 p ref)

10183. Kilmann, Peter R. & Howell, Robert J. (U South Carolina) **Effects of structure of marathon group therapy and locus of control on therapeutic outcome.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 912.—84 institutionalized female drug addicts were assigned to either direct marathon, nondirect marathon, or no-treatment control groups on the basis of the locus of control scores. Findings suggest that internals are better therapeutic risks than externals, regardless of a direct or nondirect therapist technique.

10184. Koegel, Robert L.; Firestone, Paula B.; Kramme, Kenneth W. & Dunlap, Glen. (U California, Inst for Applied Behavioral Science, Santa Barbara) **Increasing spontaneous play by suppressing self-stimulation in autistic children.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 521-528.—Studied appropriate play with toys in 2 autistic children (an 8-yr-old boy and a 6-yr-old girl) with high occurrences of self-stimulatory behavior. Each child participated in the experimental sessions in an A-B-A design, where "A"

refers to baseline sessions and "B" refers to self-stimulation suppression sessions. Results show that (a) during the baseline sessions, the children exhibited low levels of play and high levels of self-stimulatory behavior; (b) the percent of unreinforced, spontaneous, appropriate play increased when self-stimulatory behavior was suppressed; and (c) when the suppression of self-stimulation was discontinued, the percent of self-stimulation and that of appropriate play approached their presuppression levels. Results identify a set of conditions under which spontaneous appropriate behavior, uncommon in autistic children, occurs at an increased level. (24 ref)—*Journal abstract.*

10185. Kratochvíl, Stanislav. (Psychiatrisches Krankenhaus, Kroměříž, Czechoslovakia) **[Training in constructive controversy as a supportive method in group psychotherapy.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jun), Vol 26(6), 358-363.—Reports on use of a shortened and modified version of the technique developed by G. R. Bach (1969) to overcome false models of social interaction in love and marriage. The technique reduces mutual aggression by enforcing respect for the idea of "fair play" between the partners.

10186. Lazarus, Arnold A. (Rutgers State U) **Women in behavior therapy.** In V. Franks & V. Burtke (Eds), *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10187. Leonard, Laurence B. (U Pittsburgh) **A preliminary view of generalization in language training.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 429-436.—Using modeling, 8 language-handicapped 5-9 yr olds were trained in the use of 2 syntactic structures in an effort to examine the nature and extent of generalization in language training. Comparisons of pre- and posttraining tests reveal that Ss had also acquired the use of syntactic structures containing the same morphemes as those structures trained; no use was seen of syntactically identical structures containing dissimilar morphemes. Ss' ability to apply the trained morphemes appropriately and immediately to new structures suggests that the child's development from simple to complex constructions is not dependent on his use of basic constructions on which mastery of more complex constructions is predicated.—*Journal abstract.*

10188. Lima, Paul P. (VA Hosp, Miami, FL) **Behavior modification of an eating disorder on a medical ward.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 23-26.—Describes the case of a 46-yr-old male diabetic hospitalized for leg amputation. S's refusal to eat following surgery was countered with contingent social reinforcement and observations of eating behavior. S rapidly increased food intake and self-sufficient behavior. Results suggest that systematic application of operant techniques on a medical unit could help both patients and overworked staff.

10189. Little, Sandra & Jackson, Barry. (Ontario County Board of Education, Oshawa, Canada) **The treatment of test anxiety through attentional and relaxation training.** *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 175-178.—Studied the

effectiveness of attentional training in alleviating test anxiety. 34 junior high school students were randomly assigned to 1 of 5 treatment conditions: (a) attentional training, (b) attentional training plus training in deep muscle relaxation, (c) relaxation training by itself, (d) placebo expectancy, and (e) no treatment. Dependent measures included test and general anxiety instruments and a variety of tests of an academic nature. 4 trained Es were randomized across conditions and sessions. On posttesting, only the attention plus relaxation condition showed significant reductions of both test and general anxiety. Changes in the academic measures were generally consistent with an attentional analysis of test anxiety.—C. P. McCreary.

10190. Maier, I. & Hogg, J. (U Manchester, Hester Adrian Research Ctr, England) **Operant conditioning of sustained visual fixation in hyperactive severely retarded children.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 297-304.—The relative preferences of each of 10 hyperactive, severely retarded institutionalized 6-10 yr old children for a set of stimulus objects were assessed prior to use of the objects as discriminant stimuli in an operant program aimed at increasing the duration of visual fixation through the use of social and edible reinforcers. Increases contingent upon reinforcement in both percentage of time per session spent fixating the objects and frequency of visual fixation were demonstrated for most Ss by the use of reversal procedures, while analyses of variance of group results confirm these trends statistically. The present study confirms other findings that the behavior of the hyperactive child is amenable to modification through the appropriate management of discriminative stimuli and reinforcement contingencies.—*Journal abstract*.

10191. Mitchell, William S. & Stoffelmayr, Bertram E. (South Ockendon Hosp, England) **The effects of contingent social stimulation on severely withdrawn chronic schizophrenic patients.** *Psychological Record*, 1974(Fal), Vol 24(4), 515-521.—Studied the effects of contingent social stimulation on 7 male 38-60 yr old severely withdrawn chronic schizophrenic patients with social deprivation-satiation controlled by a 25-min social isolation period prior to each experimental trial. Ss received a total of 48 sessions each in a baseline, reinforcement, cross-over design. Results indicate that the opportunity to engage in a short conversation with E has reinforcing properties for such patients. (21 ref)—*Journal abstract*.

10192. Newton, Joseph R. & Stein, Leonard I. (Pikes Peak Family Counseling & Mental Health Ctr, Colorado Springs, CO) **Implosive therapy in alcoholism: Comparison with brief psychotherapy.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1256-1265.—Compared the effectiveness of 3 different types of treatment for 61 male hospitalized alcoholics. Ss were assigned either to the general milieu treatment program, to milieu and implosive (anxiety-reduction) therapy, or to milieu and brief psychotherapy. At the beginning of treatment and 25 days later at discharge Ss completed the Adjective Check List and rated how helpless and nervous they felt after listening to tape recordings of scenes depicting typical problems alcoholics have. Their responses were rated according to the Gottschalk-Gleser

Content Analysis Scales of Hostility Inward, Hostility Outward, Ambivalent Hostility and Anxiety, and the Experiencing Scale by A. M. Walker et al. Their mood, medical problems and previous night's sleep were evaluated at 6-day intervals. No one treatment resulted in a significant degree of improvement on any of the measures over that of the other treatments. All groups showed decreased distress and helplessness scores after treatment. (16 ref)—*Journal abstract*.

10193. Ounsted, Christopher; Oppenheimer, Rhoda & Lindsay, Janet. (Park Hosp for Children, Headington, England) **Aspects of bonding failure: The psychopathology and psychotherapeutic treatment of families of battered children.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 447-456.—Effected notable improvement in parent-child relations by treating mothers and battered children conjointly in a special unit geared to provide what had been lacking in the home environment. Another group, in which the child was at risk of being battered, was treated preventively on an outpatient basis with small mutual support groups for the mothers and play groups for the children. Mothers kept diaries of explosive situations, and had a social worker on call at crisis points. No incidents of battering occurred and some small improvements were seen in the mothers. (Spanish, German, & French summaries)—P. W. Pruyser.

10194. Paredes, Alfonso; Gregory, Dick & Jones, Ben M. (U Oklahoma, Medical School, Oklahoma City) **Induced drinking and social adjustment in alcoholics: Development of a therapeutic model.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1279-1293.—During a 5-wk inpatient treatment program, 137 male alcoholics participated in daily group meetings, weekly role-playing sessions, and occupational and recreational activities on an open ward. Every 2 wks, 1 S was chosen for a 2-day programed drinking schedule on which he was given a drink containing 20% alcohol every 30 min from 1:30 to 10:00 PM. A total of 33 Ss participated in this phase ("drinkers"). The MMPI, which was completed by 21 drinkers and 21 "nondrinkers" on admission and 5 wks later, showed similar profiles for the 2 groups. Significant differences between initial and 5-wk scores were found on the *Hy* and *Ma* scales for the drinkers and on the *Ma* and *Pd* scales for the nondrinkers. A 6-mo follow-up of nondrinkers and drinkers indicated that there were no differences in social adjustment (e.g., living situation, number of jobs held, or health). It is concluded that alcohol can be used as a treatment variable without untoward consequences for the patients. A therapeutic model in which alcoholics are taught to control their drinking is described. (40 ref)—*Journal abstract*.

10195. Pelosi, Anthony A. & Friedman, Howard. **The activity period in group therapy.** *Psychiatric Quarterly*, 1974, Vol 48(2), 223-229.—Describes the use of athletics immediately preceding group psychotherapy. The activity is seen as (a) a period during which participants can display emotions, (b) an outlet for aggressive energy, and (c) a method for therapists to have immediate interaction with the group. Such a technique also capitalizes upon the talents of nonpsychiatric personnel and gives the recreational facilities of the mental hospital added

usefulness in the treatment of patients from the surrounding community.—*Journal abstract.*

10196. Perkins, William H. et al. (U Southern California) **Replacement of stuttering with normal speech: III. Clinical effectiveness.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 416-428.—Tested 2 forms of behavioral management of stuttering for effectiveness, efficiency, and permanence. The emphasis with 27 clients in Method 1 was on control of rate to maintain fluency; the emphasis with 17 clients in Method 2 was on control of rate to facilitate normal management of the breathstream, phrasing, and prosody, as well as fluency. Stuttering was reduced for all clients with both methods. 92% of Group 1 (Method 1) and all of Group 2 (Method 2) retained some improvement 6 mo after treatment. 70% of both groups had reduced their stuttering by 85% or more at the termination of treatment. 6 mo later, only 30% of Group 1 retained that level of improvement, in contrast with 53% of Group 2. Coupling an 85% reduction in stuttering with a criterion for normal (225+ syllables/min), only 44% of Group 1, as compared with 65% of Group 2, achieved normal speech during treatment.—*Journal abstract.*

10197. Pollock, Donald D. & Liberman, Robert P. (St Elizabeths Hosp, Psychiatric Residency Training Program, Washington, DC) **Behavior therapy of incontinence in demented patients.** *Gerontologist*, 1974(Dec), Vol 14(6), 488-491.—Evaluated the use of social and material rewards with 6 demented men (mean age = 74 yrs) in an attempt to lessen or eliminate urinary incontinence. No significant changes were observed; possible reasons are discussed. It is suggested that future studies focus on more exact determination of incontinence rates, teaching behaviors necessary for bathroom utilization, complete medical evaluation, and adding environmental cues to aid bathroom location. A combined medical and psychological approach is seen as adding to the patients' self-esteem and releasing staff for more therapeutic work.—*Journal abstract.*

10198. Price, Kenneth P. (State U New York, Stony Brook) **The application of behavior therapy to the treatment of psychosomatic disorders: Retrospect and prospect.** *Psychotherapy: Theory, Research & Practice*, 1974(Sum), Vol 11(2), 138-155.—Reviews published reports of case studies and research on the use of behavior therapy for psychosomatic disorders (e.g., asthma, headaches, eating disorders, sleep disorders, and dysmenorrhea). The advantages and drawbacks of relaxation training, systematic desensitization, classical conditioning, assertive training, aversive conditioning, biofeedback, time-out and operant conditioning are discussed. It is indicated how physical symptoms can be influenced by manipulating social contingencies and by direct conditioning of autonomic nervous system activity. Emphasis is placed on the importance of viewing physical symptoms in the context of an individual's entire life space in order to discover controlling variables.—C. P. McCreary.

10199. Reimanis, Gunars. (Corning Community Coll) **Effects of locus of reinforcement control modification procedures in early graders and college students.** *Journal of Educational Research*, 1974(Nov), Vol 68(3), 124-127.—Investigated the hypothesis that internal

control can be increased by application of behavior modification techniques in early graders, and by special counseling efforts to strengthen verbalization of internality in college students. 10 1st and 3rd graders served as Ss in Study 1, 40 undergraduates scoring lowest on Rotter's Internal-External Control Scale served in Study 2, and 327 undergraduates served in Study 3. Data support the hypothesis; the 5 experimental Ss in Study 1 increased in internal control after 3 mo of counseling sessions and achievement motivation training was followed by immediate and long-range increase in internality for male undergraduates. However, initial increase for female undergraduates seemed to dissipate over a 6-mo period. (15 ref)—*Journal abstract.*

10200. Repp, Alan C.; Deltz, Samuel M. & Speir, Nancy C. (Georgia Retardation Ctr, Atlanta) **Reducing stereotypic responding of retarded persons by the differential reinforcement of other behavior.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 279-284.—Reports that the stereotypic responding of 3 retarded persons (a 12-yr-old female, 22-yr-old female, and 23-yr-old male) was reduced when reinforcement was delivered for specified periods of time in which the behavior did not occur. In an ABAB design in which "No!" was used in all 4 phases and in which each S was reinforced for not emitting stereotypic responding during the "B" phases, responding was decreased for the 3 Ss to an average of 1/100 of baseline levels. The method of differentially reinforcing behavior other than the specified one is discussed as an alternative to extinction. (32 ref)—*Journal abstract.*

10201. Rickard, Henry C. & Taylor, Nancy C. (U Alabama) **Strategy of multiple-baseline evaluation: Illustration from a summer camp.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 875-881.—Discusses the advantages of multiple-baseline designs by demonstrating the control of 2 different classes of desirable behavior. 2 experiments designed to increase toothbrushing and academic performance behaviors in children attending a summer camp for the emotionally disturbed are reported, and the usefulness of multiple-baseline strategies in short-term treatment programs is emphasized.

10202. Sajwaj, Thomas; Libet, Julian & Agras, Stewart. (North Mississippi Retardation Ctr, Oxford) **Lemon-juice therapy: The control of life-threatening rumination in a six-month-old infant.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 557-563.—Eliminated chronic, life-threatening rumination in a 6-mo-old infant by squirting a small amount of lemon juice into her mouth whenever rumination or its precursors were detected. A brief suspension of this therapy demonstrated its crucial role. Lemon-juice therapy offers a practical and acceptable alternative to other therapies for rumination, namely electric shock and massive noncontingent attention. However, since this study is limited to a single case, claims as to the effectiveness of this therapy across children are premature.—*Journal abstract.*

10203. Sanders, Shirley & Boswell, John. (North Carolina Memorial Hosp, Child Psychiatry Inpatient Unit, Chapel Hill) **Corrective social interaction therapy.** *Psychiatric Forum*, 1974(Fal), Vol 4(2), 11-13.—Describes a parent training program designed to improve

social interaction patterns between parents and emotionally disturbed children. Parental training sessions emphasized imitation, modeling, and role playing. Preliminary results indicate that when compared with initial baseline data, parent-child interactions were more appropriate following training. This result is considered an indication that a standardized training program is more effective than traditional counseling techniques in educating parents to interact more effectively with emotionally disturbed children. Areas requiring additional investigation are discussed.—*F. Beyer.*

10204. Schachter, Robert S. **Kinetic psychotherapy in the treatment of children.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 430-437.—Describes kinetic psychotherapy as a form of group therapy useful for children who have difficulty expressing themselves. Goals include (a) responsibility for self and actions, (b) awareness of feelings of self, (c) enhancement of self-esteem, (d) active dealings with life situations rather than passive acceptance, and (e) the use of play to further the reduction of anxiety. Through physical activity, the child can be brought into better touch with his body and feelings and thus can relate less defensively to a therapy situation. The main difference between this type of therapy and more conventional approaches lies in the children's social interactive games that are utilized. The children's feelings and behavior are observed, feedback is given, and the child becomes comfortable with communication and spontaneity. A high degree of success is reported. 3 case examples are presented.—*R. S. Albin.*

10205. Sherman, A. Robert; Mulac, Anthony & McCann, Michael J. (U California, Santa Barbara) **Synergistic effect of self-relaxation and rehearsal feedback in the treatment of subjective and behavioral dimensions of speech anxiety.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 819-827.—Studied independent treatments concentrating upon the subjective behavioral dimensions of speech anxiety to assess the existence of independent, generalized, or synergistic effects. 40 males from a beginning college speech course received 1 of 4 individually administered treatment conditions: self-relaxation, focusing on internal tension and subjective anxiety; rehearsal feedback, focusing on overt manifestations of anxiety while speaking; self-relaxation plus rehearsal feedback; or no treatment. Change scores on measures (e.g., the Institute for Personality and Ability Testing Anxiety Scale and the Fear Survey Schedule) obtained unobtrusively outside the treatment setting show that the independent treatments had no favorable effect on either subjective or behavioral speech anxiety as compared to the progress of the control group resulting solely from the speech course. In contrast, the combined treatments promoted substantial improvement on both speech-anxiety dimensions and on measures of general anxiety. (33 ref)—*Journal abstract.*

10206. Skoloda, Thomas E.; Alterman, Arthur I. & Gottheil, Edward. (VA Hosp. Coatesville, PA) **Drinking patterns on a fixed interval drinking decisions program.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 31-32.—Describes application of the Fixed Interval Drinking Decisions (FIDD)

program to 98 21-55 yr old male alcoholics. The 3 phases are predrinking, in which alcohol is not available; drinking decisions, in which Ss must decide whether or how much to drink; and postdrinking, with alcohol again unavailable. Physical, physiological, and psychological studies are accomplished concurrently, and individual and group psychotherapy is initiated during the 1st phase. 43 Ss remained abstinent, 18 drank regularly, and 37 drank moderately. Drinking patterns are analyzed and discussed.

10207. Word, Penny & Rozyanko, Vitali. (Veteran's Hosp, Operant Behavior Modification Program, Palo Alto, CA) **Behavior therapy of an eleven-year-old girl with reading problems.** *Journal of Learning Disabilities*, 1974(Nov), Vol 7(9), 551-554.—Describes a case report of behavior therapy of an 11-yr-old girl with reading problems caused by learned dysfunctional avoidance responses. Relaxation and desensitization techniques to reduce fear response were employed. Concomitantly, the behaviors of reading and of talking positively about reading were reinforced. In this case, by engaging in behaviors incompatible with anxiety, the association or connection between the stimulus and the resulting fear was broken.—*Journal abstract.*

10208. Yorkston, N. J. et al. (Friern Hosp, London, England) **Verbal desensitisation in bronchial asthma.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 371-376.—Assigned 14 adults with bronchial asthma to 2 treatment groups: 2 men and 6 women were given relaxation and 2 men and 4 women verbal desensitization. The forced expiratory volume was measured before and after each treatment session. While both groups said they felt better immediately after treatment, only the desensitized group showed significant improvement in lung function. 2 yrs later, the desensitized group had reduced the dosage of all drugs, including steroids, significantly more than the group who received only relaxation.—*W. G. Shipman.*

### Psychoanalysis

10209. Burger-Plaget, Marthe. [Changes of psychoanalytic technique.] (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(5), 273-276.—An analyst trained in both the Freudian and the Kleinian methods may find situations in the analytic process when he must change his attitude. In order to build a therapeutic alliance with a very anxious patient the analyst may have to leave his silent attitude; with a borderline patient he may need to hold off all interpretations until the patient has expressed his fury and anger. Particularly in dealing with a suicidal patient it is necessary to abandon the orthodox attitude and talk intensively with him.—*H. Bruml.*

10210. Eagle, Morris. (York U, Toronto, Ontario, Canada) **Validation of motivational formulations: Acknowledgement as a criterion.** *Psychoanalysis & Contemporary Science*, 1973, Vol 2, 265-275.—Examines T. Mischel's (see PA, Vol 41:904) proposal that acknowledgement is the critical criterion in validation of explanations which account for behavior or subjective experiences in terms of intrapsychic motivations, purposes, or desires. Since it is clearly recognized in both psychoanalysis and ordinary social life that purposeful lying and unintentional self-deception occur, the ac-

knowledge of a motivation by the person to whom it is attributed has no privileged status as a criterion for validation of motivational statements. Since motivations may not be consciously experienced, the motivated agent has no privileged access to them and is not necessarily in a better position than the psychoanalyst to assess motivational interpretations. It is concluded that the agent's acknowledgement is only one of many criteria available for evaluating statements about intentions, purposes, and motivations.—J. Kelly.

10211. Glenn, Jules. **The analysis of masturbatory conflicts of an adolescent boy with a note on "actual neurosis."** In M. Harley (Ed), *The analyst and the adolescent at work*. New York, NY: Quadrangle, 1974. xix, 303 p. \$12.50.

10212. Hirsch, Mathias. [The technique of confrontation in group and individual analysis.] (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(5), 291-300.—Discusses the therapy of borderline patients whose basic conflict is that of building up and accepting their own identity. This conflict is caused by early mother-child symbiosis in which all the child's attempts to find his identity are connected with threat of separation. In such cases confrontation has special importance; i.e., all of the analyst's attention should be given to the phenomena of which the patient is not aware. Confrontation may reproduce directly the infantile conflict situation. The therapeutic interpersonal relationship enables the patient to separate himself from the threatening symbiosis and to experience and express his destructive aggressions. In group psychotherapy the treatment of the borderline patient is helped by dividing transference among the group, which tolerates aggressive behavior without the danger involved in destroying a therapeutic 2-person relationship.—H. Bruml.

10213. Kernberg, Paulina F. **The analysis of a 15½-yr-old girl with suicidal tendencies.** In M. Harley (Ed), *The analyst and the adolescent at work*. New York, NY: Quadrangle, 1974. xix, 303 p. \$12.50.

10214. Laufer, Moses. **The analysis of an adolescent at risk with comments on the relation between psychopathology and technique.** In M. Harley (Ed), *The analyst and the adolescent at work*. New York, NY: Quadrangle, 1974. xix, 303 p. \$12.50.

10215. Legrand, Michel. (Ctr de Psychologie Différentielle et Clinique, Kessel-Lo, Belgium) [The analytic situation and the experimental situation.] (Fren) *Revue de Psychologie et des Sciences de l'Education*, 1974, Vol 9(2), 189-202.—Suggests that psychoanalysis cannot assure adequate control of its data, nor can it be an experimental instrument for validating general psychoanalytic knowledge. In the light of S. Kuhn's concept of paradigm, psychoanalysis might serve as an "operational canvas," whose equivalents could be sought by some other psychological approach such as that of B. Skinner.—S. S. Marzoff.

10216. Malengreau, P. (Ctr de Psychologie Clinique, Kessel-Lo, Belgium) [Indication, contraindication or the ambiguous request.] (Fren) *Revue de Psychologie et des Sciences de l'Education*, 1974, Vol 9(2), 119-130.—Whether or not psychoanalysis is appropriate involves its essential nature, i.e., its search for the nature of an individual's unconscious. As such, the removal of a

symptom, i.e., effecting a cure, is incidental rather than the aim. The question of whether a symptom can be removed has different meanings for the prospective analyst and for the analyst and in each case the self-concept is involved. (English summary)—S. S. Marzoff.

10217. Palombo, Stanley R. (Georgetown U) **The associative memory tree.** *Psychoanalysis & Contemporary Science*, 1973, Vol 2, 205-219.—Presents an information science based model of the collaborative search by psychoanalyst and patient for significant recollections. Memory is seen as a branching pattern of associations, with smaller units embedded in larger ones. Patients display resistance in psychotherapy by expressing associations along the least painful branches of the memory tree, or by refusing to deal with critical nodes in the memory pattern. The role of the analyst in psychotherapy is to help the patient recover significant memories by monitoring his choice of branches during the free association process. It is suggested that analogies drawn from information science can provide a conceptual framework by which both the intrapsychic and interpersonal aspects of psychoanalysis can be understood.—J. Kelly.

10218. Peterfreund, Emanuel & Franceschini, Edi. (Mt Sinai School of Medicine, City U New York) **On information, motivation, and meaning.** *Psychoanalysis & Contemporary Science*, 1973, Vol 2, 220-262.—Presents an information processing model of motivation as a replacement for existing metapsychological theories which attribute the patterning and selection of behavior to the actions of psychic energies. An information model of motivation provides a unified explanatory framework within which the contingencies, priorities, and levels of motivation observed in clinical practice can be analyzed in terms of simple decision steps and specific causal relationships. Information theory explains motivation in terms of the patterning activity of the whole organism, without relying on postulates of free will and conscious awareness, or on artificial dichotomies between emotion and cognition. Some brief clinical examples are presented to illustrate the application of information processing concepts to observed motivational phenomena. It is suggested that an information processing approach offers a dynamic metatheory of motivation which is consistent with neurophysiological findings. (22 ref)—J. Kelly.

10219. Pulver, Sydney E. (Inst of the Pennsylvania Hosp. Physician Education Project, Philadelphia) **Freud and third-party payment: A historical note.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1400-1402.—Presents excerpts from the diary of Joseph Wortis to illustrate Freud's analysis of a man whose fees were paid by a 3rd party. Freud made no specific recommendations concerning 3rd-party payment, but the fact that he undertook Wortis' analysis seems to indicate that he did not find it an obstacle. Although this analysis was unsuccessful, the failure does not seem to be related to the type of payment.—Journal abstract.

10220. Rolla, Edgardo H. [Reformulations and notes within psychoanalytic theory.] (Span) *Revista de Psicoanálisis*, 1974(Jan-Jun), Vol 31(1-2), 323-364.—Presents a redefinition of psychoanalysis as a scientific doctrine of

the totality of the organization and functioning of the human being. (26 ref)

10221. Searles, Harold F. (Georgetown U, Medical School) [Concerning therapeutic symbiosis.] (Germ) *Dynamische Psychiatrie*, 1973, Vol 6(6), 373-390.—Discusses autism, symbiosis, and individuation. The symbiotic relatedness between patient and analyst, the similarity to the early mother-child symbiotic stage, and the individuation processes on both sides are examined. The need of the patient to act as the therapist and fill the unconscious ego deficit of the analyst is noted. Regression during the therapeutic process leads to a stage of archaic ambivalence in which feelings of being threatened, reciprocal symbiotic closeness and dependence, and jealousy play an important role on both sides. (English summary) (18 ref)—T. Fisher.

10222. Shope, Robert K. (U Massachusetts, Boston) **Freud's concepts of meaning.** *Psychoanalysis & Contemporary Science*, 1973, Vol 2, 276-303.—Describes Freud's use of the term "meaning" to refer to purpose or intention and to express that for which a mental phenomenon substitutes. Some relationships between the concepts of symbol, meaning, and mental event are discussed. (27 ref)

10223. Spence, Donald P. (New York U) **Tracing a thought stream by computer.** *Psychoanalysis & Contemporary Science*, 1973, Vol 2, 188-201.—Presents an analysis of the stream of thought leading to a specific question ("Are you pregnant?") asked by a patient during the 5th hr of analysis with a new therapist. The speech of a young woman whose analysis had been taken over by a conspicuously pregnant therapist was analyzed for direct and indirect associations to the theme of pregnancy, which was assumed to be associated by the patient with the anxiety provoking theme of separation. A computer content analysis revealed oscillations in the number of references to pregnancy-related themes both within and between separate therapeutic hours. It is suggested that various defensive maneuvers interrupted the stream of thought which connected the patient's initial contact with the therapist to her direct posing of the question about pregnancy.—J. Kelly.

10224. Zac, Joel. [The search for the articulation of psychoanalysis and epistemology.] (Span) *Revista de Psicoanálisis*, 1974(Jan-Jun), Vol 31(1-2), 459-501.—Presents a synthesis of ideas on psychoanalysis as theory and as therapeutic technology, focusing on methods of obtaining data from clients.

10225. Zenoni, A. [Psychoanalysis and language: I. Freud.] (Fren) *Revue de Psychologie et des Sciences de l'Education*, 1974, Vol 9(2), 163-187.—Views psychoanalysis as removing symptoms and reorganizing intersubjective relations because psychic structures in the unconscious are formed in the same way as analytic free association. According to Freud, dreams, slips of the tongue, symptoms, obsessions, etc, are manifestations of a thought which works according to the procedures of ideographic writing. For this reason free word association without constraint of conscience leads to the discovery of the enigmatic connections underlying symptoms. (24 ref)—S. S. Marzolf.

## Counseling & Community Mental Health & Crisis Intervention

10226. ———. **Management information: A "mini" symposium.** *Administration in Mental Health*, 1973(Fal), 4-41.—Presents 3 articles on management information. The first explores the different roles of researchers and administrators in using information as an instrument of accountability. These roles will determine how and whether such information is actually used. The 2nd outlines the principles on which a county management information system should be built, if the objective of the system is to facilitate decision-making by management. The 3rd describes a study of information exchange patterns in a mental health center, conducted incidental to the loading of a management information system. Results showed little reliance on written documents to facilitate communication. Additional issues in mental health management information are discussed. (28 ref)—R. J. Albers.

10227. Adelson, Daniel. **Community psychology as man's encounter with history: Or self and social reconstruction as two main aspects of the same process: A point of view.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 402-405.—Defines community psychology as man's encounter with history, and suggests that each person (hopefully) becomes a maker of history—whether as creator or creature in his relationships with his community. The definition of community psychology is related to the concepts of development and/or process; system; and culture. It is contended that community psychology has as its first commitment the working out of ways to deal with total communities. An 8-point model of broad philosophical guidelines is presented, using as its base this theory.—P. O'Brien.

10228. Bath, Kent. (State University Coll New York, Buffalo) **The use of intensive individual designs in community research.** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 418-425.—Discusses the idea of using multivariate research designs with an individual focus to study questions at the community level. General advantages as well as more specific aspects and examples of applicability are explored. Although the need for replications is obvious in individual methodologies, their strength in terms of investigating causal hypotheses and the effects of programs recommends these designs for consideration. The indirect study of program efficiency is also put forth as a strong point.—Journal abstract.

10229. Bazeley, Patricia & Viney, Linda L. (Macquarie U, North Ryde, NSW, Australia) **Women coping with crisis: A preliminary community study.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 321-329.—Interviews with 221 women living in government housing tested the hypothesis that some means of coping were more frequently employed during particular types of crisis. The hypothesis was supported in that passive coping was more often reported in bereavement and family conflict and illness while active coping was more frequent in separation and developmental crises. Reliance on their nuclear family and on informal social networks was more frequent at times of bereavement and marital breakdown. The use of formal social networks occurred most often in times of personal and family

illness and financial crises. Ss' age and marital status predicted the types of crises they reported; leisure time and religious experience were associated with means of coping. Ss with low mental health status reported more crises overall, specifically those involving family conflict, personal illness, and continual problems, they also relied heavily on passive coping and formal social networks. Findings point to opportunities for community intervention. (25 ref)—*Journal summary*.

10230. **Bleach, Gail & Claiborn, William L.** (U Maryland) **Initial evaluation of hot-line telephone crisis centers.** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 387-394. Assessed the level of counseling and information-giving skills of 4 hot lines by rating phone calls between role-playing callers and actual hot-line workers. 6 female undergraduates served as callers. 4 problem calls were designed to reflect those most commonly experienced and included pregnancy, loneliness, parent difficulties, and drug-related problems. A total of 96 calls were made. Results, indicating differences on several variables across hot lines and some differences across caller "problems," are discussed in terms of implications for the evaluation of training and service effectiveness. (16 ref)—*Journal abstract*.

10231. **Boller, Jon D.** (State Economic Opportunity Office, Head Start Project Director, St Paul, MN) **Differential effects of two T group styles.** *Counselor Education & Supervision*, 1974(Dec), Vol 14(2), 117-123. —Presents a rationale for examining the effects of the T group on introverts and extroverts. 2 T-group styles were examined—a sensory awareness group and a verbal cognitive group. Ss were 40 graduate counseling students classified as either introverts or extroverts by the Maudsley Personality Inventory. Results indicate that the sensory awareness group was more profitable to both personality types and that there was a direct relationship between personality type and profit in a T group. Although introverts profited less than the extroverts, there was reason to believe that an extended group experience might have been more profitable for the introverts. Profit was measured by quantifying emotional reactions to the ongoing group process at timed sampling intervals with G. C. Homans's social exchange model. Poker chips were used as symbolic representations of positive and negative effect.—*Journal abstract*.

10232. **Brayshaw, Bob.** (Ministry of Correctional Services, Ontario, Canada) **Leisure counselling for people in correctional institutions.** *Journal of Leisureability*, 1974(Jan), Vol 1(1), 10-14.—Describes a technique for group leisure education and counseling developed within the Ontario, Canada, correctional system to prepare inmates for coping with life in and out of prison. Groups are formed on the basis of marital status, age, and time remaining in sentence. Possibilities for extending this technique to other institutions are discussed.

10233. **Brooks, Carol M.** (Dede Wallace Ctr, Northeast Nashville Branch, TN) **New mental health perspectives in the black community.** *Social Casework*, 1974(Oct), Vol 55(8), 489-496.—Describes a model for nontraditional approaches to the delivery of mental health services in black communities.

10234. **Browning, Philip L.; Campbell, David R. & Spence, Joyce T.** (U Oregon, Rehabilitation Research &

Training Ctr in Mental Retardation) **Counseling process with mentally retarded clients: A behavioral exploration.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 292-296.—Examined behavioral aspects of the process of counseling with 28 adolescent mentally retarded clients. Transcripts from an early and a late counseling session were rated according to the initial client statement (dependent, hostile, or other), therapist response (approach or avoid), and client continuation of the topic. Results indicate that counselors varied significantly in approach-avoidance response style with respect to client IQ level and type of client statement, and retarded clients varied significantly in continuation response style with respect to therapist approach-avoidance behavior and client IQ level.—*Journal abstract*.

10235. **Calla, Vincent F.** (Rhode Island Coll) **Systematic human relations training: Appraisal and status.** *Counselor Education & Supervision*, 1974(Dec), Vol 14(2), 85-94.—Discusses the impact of the systematic human relations training (SHRT) model on the contemporary helping scene. The rudiments of the model and its historical antecedents are described, and various technical and philosophical issues are identified. The model's uncertain theoretical status, questionable and conflicting developmental elements, the merits and hazards of graded structure, the meaning and permanency of client change, the relationship of process and outcomes, the dangers of universalizing and venerating the model's attributes, and the paradox of training for transcendence are all discussed. (24 ref)—*Journal abstract*.

10236. **Coghlan, Alben J.; Pixley, Lawrence & Zimmerman, Roger S.** (Holy Cross Campus, Drug Abuse Program, Rhinecliff, NY) **Community mental health concepts and methadone maintenance: Are they compatible?** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 426-433.—Discusses some of the problems and issues associated with outpatient methadone maintenance programs located within community mental health centers. It is concluded that, in general, such programs do not belong in mental health centers. The role of the mental health center should be that of a backup service for referral of those addicts who have emotional problems and who are motivated for the services provided by the center. (20 ref)—*Journal abstract*.

10237. **Cull, John G. & Hardy, Richard E.** (Eds.). (Virginia Commonwealth U) **Organization and administration of drug abuse treatment programs: National and international.** Springfield, IL: Charles C Thomas, 1974. xii, 342 p.—Presents 25 articles on drug rehabilitation programs run by state or municipal agencies, private nonprofit drug treatment programs, and international drug abuse treatment programs. Administrative, staff, and funding issues involved in these types of programs are examined.

10238. **Dameron, Joseph D.** (North Texas State U) **Futuristic guidance programs: Texas in the 1980's?** *Texas Personnel & Guidance Association Journal*, 1972(Sep), Vol 1(1), 45-53.—Presents the concept of differentiated staffing in a new group of guidance positions: auxiliary, technical, paraprofessional, and support personnel, thus developing a career ladder. The programs discussed are in public schools but can be adapted to community colleges, universities, community

agencies, and employment agencies. It is suggested that the guidance training programs of the future will be built on performance-based competencies, eliminating semester-long courses and semester hours. The new staffing concept is offered as an antidote to the waning support for counselors and their present services. Its objective is to make the profession more "accountable."—H. H. Crouch.

10239. Dar, H.; Winter, S. T. & Tal, Y. (Rothschild Hosp, Genetic Unit, Haifa, Israel) **Families of children with cleft lips and palates: Concerns and counseling.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 513-517.—Studied 51 families in which there was a child with cleft lip or palate to ascertain their concerns. 24 received genetic counseling, immediately after the birth of the child, for up to 1 yr; the remainder were not counseled. Parents had many superstitions and misapprehensions, and were prone to guilt feelings. (French, German, & Spanish summaries)

10240. Easton, Karl. (Boerum Hill Home & Vocational Rehabilitation Inst, Brooklyn, NY) **Some psychodynamic considerations in the program development of Boerum Hill: A psychiatric halfway house.** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 395-401.—Based on 5 yrs of developing and working in a 260-bed psychiatric halfway house, a definition and discussion of psychiatric rehabilitation are presented. The significance of temporariness of stay in a halfway house is noted. The method of the establishment of a proper therapeutic community environment that will bring about a corrective living experience is described. Also, aspects of the significance of the physical plant, the size of the residence, the role of psychotropic medication, and the management and staff attitudes toward regression are discussed. The psychodynamics of personality change and the importance of high expectations in the rehabilitation effort are presented.—*Journal abstract.*

10241. Evans, Ronald L. & Moberley, Bruce D. (VA Outpatient Clinic, Seattle, WA) **Theoretical and empirical assessment of adjustment to civilian living.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 11-15.—Administered a structured interview exploring 19 social variables to approximately 500 veterans. Features associated with poor adjustment to civilian life were an intense expressed need for services, extent of subjective feeling of debilitation, and noted objective transiency. Positive adjustment obtained when the individual had maintained a strong kinship support system, was aware of and utilized public services, and had benefited from the passage of time by learning to cope with a chronic disability regardless of its extent or nature.

10242. Freund, John. **Divorce and grief.** *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 40-43.—Observations of reactions of a group of divorced and separated persons to a presentation of various stages of grief suggest that they experience grief and that since it is often unrecognized as such by themselves and society, the working-through process is hindered. An overview of the working-through process shows a surprising lack of articles on understanding and coping with the feelings of loss through divorce. In fact, many authors rarely label these emotions as grief. It is suggested that

marriage counselors devote more attention to the problem and that they correlate it with the growing literature on grief. (Spanish & French abstracts)—*Journal abstract.*

10243. Giordano, Joseph. **Ethnic and minorities: A review of the literature.** *Clinical Social Work Journal*, 1974(Fal), Vol 2(3), 207-220.—Cites various study outcomes which indicate differences in the values and attitudes of selected ethnic minorities, and describes how these differences affect utilization of health systems. Content suggestions are made for training future mental health professionals.—S. R. Stein.

10244. Goodman, James A. (NIMH, Bethesda, MD) **The social health of disadvantaged black college students.** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 272-273.—Discusses the nature of black social health problems in terms of environmental influences. Several types of black college students are identified whose basic needs and attitudes must be understood to enable them to fully benefit from health related services.

10245. Gurman, Alan S. (U Wisconsin, Medical School) **Attitude change in marital cotherapy.** *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 50-54.—Replicated L. E. Beutler's (see PA, Vol 47:9431) study of attitude change in marital therapy and extended it to the cotherapy situation. Attitudes of 12 couples in conjoint therapy with male and female cotherapists were measured before and after treatment and compared with their therapists' attitudes. At termination, therapists and patients rated marital relationship change and spouses' improvement. Results generally support the previously found association between patient-patient attitude convergence and outcome, but the magnitude of this relationship varied as a function of both rater and outcome dimension. Contrary to earlier research, results show specific patient-therapist attitudinal convergences to be related to outcome measures. Attitude convergence within the marital dyad was negatively related to cotherapists' experience-level difference. The influence of the cotherapy relationship on marital therapy outcome is discussed. (Spanish & French abstracts)—*Journal abstract.*

10246. Helms, Luisa. **Mexican-Americans.** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 269-271.—Discusses the Mexican-American's approach to physical and mental health by describing certain characteristic attitudes and behaviors. The importance of understanding cultural values and beliefs is emphasized.

10247. Hirschman, Richard. (Kent State U) **Utilization of mental health consultation and self-perceptions of intraorganizational importance and influence.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 916.—Predicted that self-ratings of importance and influence for each of 17 volunteer workers in a mental health crisis center would be positively correlated to each worker's latency in the use of a mental health consultant. Results support the prediction for self-perceptions of influence and importance, but not for perceptions of the value of consultation in general, actual help derived from a consultant, or the number of hours in voluntary service.

10248. **Hirschowitz, Ralph G.** (Harvard U, Medical School, Lab of Community Psychiatry, Boston) **Pattern for change.** *MH*, 1974(Spr), Vol 58(2), 32-35.—Suggests that survival in the arena of human services demands that today's program planner follow a pattern for change. Deficiencies in current agency services and corrective measures are discussed. These include the realization that change is engagement in political change process and is not effectively achieved by technocratic prescription.

10249. **Horejsi, Charles R.** (U Montana) **Small-group sex education for engaged couples.** *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 23-27.—Describes a counseling program in which small groups of 3 engaged couples each are presented with 10 case situations or vignettes as focal points for their discussion about interpersonal difficulties, mainly centered in their sexual relationship. This approach has been found helpful in generating exchanges and questions among the participants, which in itself opens up a new manner of communication between the future spouses. This improved communication, plus the sexual information obtained in these groups, promises to be beneficial in the marriage. The role of the group leader is discussed, and sample vignettes are presented. (Spanish & French abstracts)—*Journal summary*.

10250. **Hurley, James T. & George, Rickey L.** (Buchanan High School, Troy, MO) **Telephone counseling: Charlatan or helper.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 36-41.—Describes the operations of Suicide Prevention Incorporated (SPI), the Youth Emergency Service (YES), and the Acid Rescue (AR), groups that operate telephone services for the distressed in a large urban area in the Midwest. The YES provides information about housing for runaways, sexual problems, VD detection, drug counseling and other problems. The AR operates in the area of drug education and individual and family counseling. The SPI emphasizes referral services to those who contemplate self-destruction. All staff members of the YES and the AR are unpaid volunteers. College graduates make up about 85% of the YES staff, 50% of the AR, and 25% of the SPI. All telephone calls are confidential. The services of AR and of SPI are on a 24-hr basis. The YES receives an average of 90 calls/mo, the other 2 services receive about 400 each. The services appraise their own effectiveness as ranging from "above average" to "excellent."—*A. J. Ter Keurst*.

10251. **Just, Marion R.; Bell, Carolyn S.; Fisher, Walter & Schensul, Stephen L.** (Wellesley Coll) **Coping in a troubled society: An environmental approach to mental health.** Lexington, MA: D. C. Heath, 1974. xi, 113 p. \$11.—Presents a collection of 6 articles which discuss social and environmental perspectives of mental health. Topics include the psychological effects of economic disturbances and social policies (e.g., welfare, zero population growth, and segregation), coping with political alienation, community-oriented mental health services, treatment through institutional change, and reorienting mental health policy. (4½ p ref)

10252. **Kirstein, Larry; Prusoff, Brigitte; Weissman, Myrna & Dressler, David M.** (Yale U, Medical School) **Utilization review of treatment for suicide attempters.**

*American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 22-27.—Tested the validity of the criterion-oriented approach to evaluating care given patients with suicidal behavior, comparing explicit criteria proposed by a panel of experts as essential determinants for psychiatric hospitalization with the actual clinical data on 248 suicide attempters. It was found that according to the experts' criteria (which were operationalized into rating assessments), over half of the outpatient sample should have been hospitalized. After multiple regression analysis of the criteria, however, 4 predictors showed that only 20% of the outpatients should have been hospitalized. The issues these findings raise about the criteria of the experts, their utility for research, their validity, and their implications for utilization review are discussed.—*Journal abstract*.

10253. **Klosterman, Dale.** (Northern Kentucky Comprehensive Care Ctr, Covington) **The role of the school psychologist in a community mental health center.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 269-274.

10254. **Knox, David & Knox, Frances.** (East Carolina U) **Preparation for marriage: Beyond the classroom.** *Journal of Family Counseling*, 1974(Fal), Vol 2(2), 16-22.—100 undergraduate couples who defined themselves as "involved" in a serious dating relationship completed a project in which the partners shared opinions (on economics, religion, children, sex, in-laws, alcohol, and recreation), took a 4-mile hike, developed a budget, selected an apartment and furniture, went to church and visited future in-laws. 52% of the Ss noted that the exchange of opinions was the most meaningful aspect of the project. Religion was selected as the least meaningful. Student and professional reactions to the project are discussed. (Spanish & French abstracts)—*Journal abstract*.

10255. **Koeppen, Arlene.** (Richardson Independent School District, TX) **Confrontation: A threat and a promise.** *Texas Personnel & Guidance Association Journal*, 1972(Sep), Vol 1(1), 39-43.—Describes an essential function of counseling which must be performed by someone significant to the client and timed to create constructive interaction. In confrontation, giving or receiving pain is the threat; helping or growing is the promise.

10256. **Kroll, Jerome.** (Rockland Psychiatric Ctr, Orangeburg, NY) **The career ladder and the mental health generalist at the state hospital.** *Psychiatric Quarterly*, 1974, Vol 48(2), 184-192.—Discusses the relevance of several broad social and educational changes to the training of persons for careers in mental health. This is viewed against the background of traditional beliefs about training and competence which have guided policies until very recently, but are now being questioned. It is suggested that the state hospital has an opportunity to move away from its traditional custodial role by teaming up with local community colleges and developing community-oriented training programs for careers in mental health.—*Journal abstract*.

10257. **Levinson, Daniel J. & Astrachan, Boris M.** (Yale U) **Organizational boundaries: Entry into the mental health center.** *Administration in Mental Health*, 1974(Sum), 3-12.—Describes criteria for an effective client entry system (ES) for health-education-welfare

organizations, using the community mental health center as an example. Major tasks of an ES are specified and problems with each task are discussed. (22 ref)

10258. Levy, Robert & Brown, Allan. (U Chicago, Hosp & Clinics) **An analysis of calls to a drug-crisis intervention service.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 143-152.—Presents a history and evaluation of Acid Rescue, a St. Louis drug crisis center. 1,543 telephone call reports were evaluated. LSD, other hallucinogens, and amphetamines were the drugs most commonly involved in crisis calls. The route of administration had the strongest correlation with the somatic or psychiatric symptoms reported. The influence of the center volunteers' drug experiences and professional backgrounds on the type of advice given is noted. An evaluation methodology and set of variables applicable to drug counseling programs is suggested. (21 ref)—R. Tomasko.

10259. Lifshin, Joanne H. & Schultz, Myra. (Brookdale Hosp Medical Ctr, Brooklyn, NY) **Treatment of a constellation of perceptual and behavioral difficulties in a community mental health center: Preliminary report.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 333-337.—Examined the effectiveness of a structured group program in treating boys with perceptual and behavioral difficulties. Ss were 10 boys 8-12 yrs old who were outpatients at a community mental health center. The group programs were designed either to enhance coping skills or to facilitate encoding experience. The overall results indicate that the program was a success.—H. Kaczowski.

10260. Long, Nicholas. (InterStudy Information & Referral Ctr, Minneapolis, MN) **A model for coordinating human services.** *Administration in Mental Health*, 1974(Sum), 21-27.—Presents a model designed to enhance cooperative behavior among human services organizations. The model includes an incentive-based network with defined responsibilities and evaluation of services.

10261. Mathews, Glenn. (West Virginia Board of Vocational Rehabilitation, Charleston) **Preparing for counseling with the deaf client in the vocational training setting.** *Journal of Rehabilitation of the Deaf*, 1974(Apr), Vol 7(4), 29-33.—Describes counseling with the deaf client as intrinsic to success in a vocational rehabilitation setting. The client himself, the staff, and the problems that arise in their meetings are discussed.

10262. McRee, Christine; Huckle, Brian; Corder, Billie F. & Flori, Lorraine. (Dorothea Dix Hosp, Raleigh, NC) **Utilizing psychiatric intervention techniques as a model for consultation in school-community crises: A case history.** *Psychiatric Forum*, 1974(Fal), Vol 4(2), 6-10.—Describes the diagnosis and treatment of an acute school-vandalism problem in an integrated public school. The traditional psychiatric consultation model was modified to effectively deal with a school-community crisis.

10263. Messier, Michael J. [The role of the local community service centers in the organization of psychiatric care.] (Fren) *Vie Médicale au Canada Français*, 1974(Jun), Vol 3(6), 598-601.—Suggests a way in which the psychiatric team can provide community

preventive services by making appropriate arrangements with the center's administration.

10264. Miran, Michael; Lehrer, Paul M.; Koehler, Robert & Miran, Esta. (Rutgers State U) **What happens when deviant behavior begins to change? The relevance of a social systems approach for behavioral programs with adolescents.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 370-375.—Experimented, in a community consultation program, with 14 unruly 8th-9th grade boys in a modern suburban school, using group and behavioral therapy. 6 boys, referred for therapy but not treated, served as controls. Consultants worked with guidance and psychology services of the school and with the Ss themselves. External reinforcers in the form of "points" were given to Ss; however, pressure from the community to cut school costs forced the school to eliminate the rewards that points could buy. The combined group and behavioral treatment prevented academic deterioration by teacher's ratings. Also, during the external reinforcement, school suspensions in the experimental group decreased, while suspensions in the control group increased, such that the same total of suspensions per month took place. Results point to the need for primary prevention and systems-oriented consultation.—*Journal summary.*

10265. Ostow, Mortimer & Cholt, Betty. **Unhappiness and mental illness.** *New York State Journal of Medicine*, 1974(Jun), Vol 74(6), 984-992.—Presents cases illustrating the nature of psychological difficulties found among clients seeking assistance at a rabbinical counseling center. Few clients were seen as mentally ill either by themselves or by their relatives, but many exhibited serious restrictions of behavior potential and of the capacity for interpersonal relationships. Advice from the rabbi was often sought by individuals who wished to change the behavior of others, rather than to correct their own thinking or behavior. It is concluded that the type of population which seeks help from religious counselors is substantially different from that which receives psychiatric assistance. It is suggested that the concept of mental illness be broadened to include not only cases of clearly diagnosed pathology but also persons whose minimal personality disorders cause suffering to themselves and others.—J. Kelly.

10266. Parikh, Barbara; Steinbach, Ingrid; Tausch, Anne M. & Teege, Franke. (U Hamburg, Psychological Inst, W Germany) [Dimensions of the voice and speech style of telephone counselor-therapists, correlation with personality variables, and preference by persons seeking advice and help.] (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 2(2), 145-150.—Investigated client-centered therapy and counseling by telephone and the effect of the counselor-therapist's voice and manner of communication on case outcome and acceptance in 28 counselors of varying age and experience. Ss answered standard counseling questions by telephone and completed the items on 6 scales of the Shostrom Personal Orientation Inventory (POI). Their performance was evaluated by 50 raters according to criteria of voice and speech style, and by patients of a psychiatric day clinic according to their preference in situations requiring advice and help. A factor analysis of 21 items produced 4 relationships: Empathic Understanding-Objective In-

struction, Warm Sympathy-Cold Indifference, Encouraging Acceptance-Discouraging Criticism, Positive Statement-Hesitant Consideration. The multiple rank correlation indicates that clients prefer counselors whose communication is marked by positive statements, encouraging acceptance, and warm sympathy. Correlations between voice-speech qualities and personality variables according to the POI scales indicate that warm sympathy correlates significantly with self-acceptance and self-actualization and sensitivity to their own feelings on the part of the counselor-therapists. (English summary)—T. Fisher.

10267. Pavlovský, P. (U Karlova, Prague, Czechoslovakia) [Psychiatric aspects of hemodialysis.] (Czec) *Československá Psychiatrie*, 1973(Apr), Vol 69(2), 118-123.—Reviews literature dealing with psychiatric problems of patients under permanent hemodialysis. 15 such cases (11 males and 4 females, average age 44 yr), who began such treatment after more than 12 yrs of renal disorder are described. Depression, anxiety, lability, apathy, decreased sexual activity, anorexia, and sleep disorders were common clinical symptoms. Psychotherapy including members of the family and psychological help for the nursing staff, on whom patients are highly dependent, are recommended. (Russian & English summaries)—V. Fischmann.

10268. Pelegrino, Donald A. (California State U, Northridge) **Death and dying counseling and the recreation therapist.** *Journal of Leisureability*, 1974(Jul), Vol 1(3), 15-18.—States that recreation therapists should remedy their lack of experience with, and knowledge of, dying patients. An attitude of acceptance rather than fear is necessary if the therapist is to be successful. Conversation is seen as a therapeutic tool, and the emphasis should be on continuing activities as long as possible.

10269. Ramer, Barry S. & Flohr, Rinna B. **Rational planning for drug abuse services.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 269-276.—Describes the development of the San Francisco Coordinating Council on Drug Abuse as a model of a comprehensive drug abuse planning process. (54 ref)

10270. Robinson, Lillian H. (Tulane U, Medical School) **Group work with parents of retarded adolescents.** *American Journal of Psychotherapy*, 1974(Jul), Vol 28(3), 397-408.—Discusses the sources of difficulty parents face in coping with retarded children and suggests ways of ameliorating these problems. 2 principal causes for such difficulty are the emotional impact of having a retarded child, and the lack of knowledge about the child's condition. Work with parents includes education, counseling, therapy, or various combinations of these. Advantages are cited for providing services for groups of parents. An illustrative short-term group of parents of vocational students is described in some detail. As the group progressed, parents became more willing to let their children grow up, and thus became more cooperative with the vocational school in its efforts to promote independent functioning.—R. S. Albin.

10271. Rosen, Irving M. (Cleveland Psychiatric Inst, OH) **Some contributions of religion to mental and physical health.** *Journal of Religion & Health*, 1974(Oct), Vol 13(4), 289-294.—Reviews some supportive mental health contributions that clergy can make in typically

psychiatric situations. It is argued that clergy are more suited to deal with the whole person and with humanization of patients than are psychiatrists and other medical workers, since the latter deal only with what is objectively known but religion deals also with knowledge not completely understood in objective contexts.

10272. Sanderson, Robert G. **A personal theory of counseling.** *Journal of Rehabilitation of the Deaf*, 1974(Apr), Vol 7(4), 22-28.—Describes a personal theory of counseling the deaf, including thoughts on the nature of man, human growth and development, goals of therapy, characteristics of the client and the counselor in a therapeutic relationship, and therapeutic methods.

10273. Schapiro, Hans M. (New York State Dept of Mental Hygiene, Albany) **The state hospital: What is its future?** *MH*, 1974(Spr), Vol 58(2), 11-16.—Discusses the future role of the state mental hospital and alternative ways in which they can become an integral part of a total service delivery system in the treatment of the mentally ill. Special emphasis is placed on expansion of services, coordination with other community resources, and transferring control of the hospital to the community.

10274. Smith, David E. (Haight-Ashbury Free Medical Clinic, San Francisco, CA) **Street drug analysis and community based drug programs.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 153-159.—Describes several types of programs providing accurate information about drugs delivered in a believable manner to the user community. Controversies around such programs are highlighted, and the view that withholding information about street drugs will reduce their usage is disputed.

10275. Speyer, Nico; Diekstra, Rene F. & Van de Loo, Karel J. (Eds.). **Proceedings: 7th International Conference for Suicide Prevention, Amsterdam, The Netherlands, August 27-30, 1973.** Amsterdam, Netherlands: Swets & Zeitlinger B. V., 1974. xvi, 661 p.—Presents a collection of 85 symposium papers in English, French, and German on characteristics of, and factors in, suicidal behavior; follow-up studies of attempted suicides; suicidal behavior in different life stages; epidemiological studies of suicidal behavior; sociocultural factors in suicide; therapy and management of suicidal persons; the role and problems of volunteers in suicide prevention; and suicide and mass media.

10276. Sue, Stanley; McKinney, Herman; Allen, David & Hall, Juanita. (U Washington) **Delivery of community mental health services to black and white clients.** *Journal of Consulting & Clinical Psychology*, 1974(Dec), Vol 42(6), 794-801.—Compared services rendered to 959 black and 11,904 white clients seen at 17 community mental health centers. Data included client's age, sex, income, education, marital status, diagnosis, assignment to type of treatment program, major service received, number of contacts, and assignment to type of therapist. Results indicate that the 959 blacks compared to a 10% random sample of 1,190 whites (a) represented a different group of clients in demographic characteristics, (b) were no more likely to receive inferior forms of treatment programs, (c) saw paraprofessional rather than professional personnel, and (d) failed to return after the initial contact at a high rate (i.e., over 50% terminated at this time). The latter 2 findings persisted irrespective of

other demographic differences between blacks and whites. (20 ref)—*Journal abstract.*

10277. Tausch, Anne-Marie; Kettner, Ursula; Steinbach, Ingrid & Tönnies, Sven E. (U Hamburg, Inst of Psychology, W Germany) [Effects of child-centered individual and group counseling on disadvantaged kindergarten and second grade children.] (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(2), 77-88.—For 6-7 wks client-centered counseling was given individually once weekly for 10 min and in a group once weekly for 30 min to 29 disadvantaged kindergartners. The same treatment, plus a second 30-min group session, was conducted with 30 disadvantaged 2nd graders. Counselors were specially trained psychology students. 28 disadvantaged kindergartners and 25 2nd graders served as controls, and 27 nondisadvantaged kindergartners and 19 2nd graders were available for comparison. Counseled children increased significantly in their emotional stability, social cooperation, and sociability as rated by 29 parents. Their perceptual accuracy increased significantly, as did "self-exploration" by 2nd graders. The latter correlated .49 with "positive regard" by the psychologists and .42 with empathic understanding. There was no increase in social maturity and no measurable decrease in anxiety. (English summary)—*W. O. Horn.*

10278. Thomas, Kenneth R.; Gottlieb, Anne B. & Kravetz, Shlomo P. (U Wisconsin, Madison) **Congruence and attributes of meaning: Community mental health center and vocational rehabilitation personnel.** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 402-408.—The purpose of this study was to (a) investigate similarities and differences between vocational rehabilitation and community mental health center personnel in their perceptions of 8 concepts relating to emotional disability, social and vocational adjustment, work, dependence, and agency affiliation; and (b) provide descriptive information regarding the structure of these helpers' value systems as reflected in their ratings of the 8 concepts. 20 vocational rehabilitation counselors and 20 community mental health workers served as Ss. The semantic differential technique served as the basis for construction of the research instrument. Data were analyzed by means of a 2-way analysis of variance for repeated measures. Results indicate that (a) the groups differed in their ratings over all 8 concepts, (b) some of the concepts were seen more favorably by both groups than other concepts, and (c) particular concepts did not discriminate between the groups. Findings are discussed and tentative hypotheses are presented.—*Journal abstract.*

10279. Thuyns, Karen & Evans, Ron. (VA Hosp. Seattle, WA) **Comprehensive health care as a function of consumer-provider relationship.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 27-29.—Investigated the health care consumer-provider relationship through interviews with 60 health care consumers. 5 consumer utilization variables and 2 provider variables defined comprehensive health care, the role of the primary health provider, and continuity of care. Results show that only 3% of the Ss experienced a continuous consumer-provider primary care relationship.

10280. Tippet, Jean; Owens, Rosita & Frome, Francine. (Area A Community Mental Health Ctr, Washington, DC) **Indirect services and referral system for community mental health centers: Implementation and methods of measurement.** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 450-465.—Explores the role of indirect services and a client referral system in community mental health and presents a method of implementing, tracking, and evaluating them within a center. The method can be used with or without computer support and includes a resource index, an optical coincidence card-sort file for fast and appropriate client referrals, and an indirect service form for recording community-oriented services, staff training activities, and other staff functions not directly related to client care. Use of the system by a facility considerably expands its service potential by placing at its immediate disposal a large number of service resources, thus providing an extensive network of comprehensive care within the catchment area.—*Journal abstract.*

10281. Uchimura, Hideyuki. (U Connecticut, Lab of Neuropsychopharmacology) [Community psychiatry in the Connecticut state department of mental health facilities.] (Japn) *Kyushu Neuro-psychiatry*, 1973(Dec), Vol 19(3-4), 228-234.—Reports on location of patients (by bed and by ward) throughout the facilities in Connecticut, occupational therapy, service programs for chronic patients, inpatient statistics for the year ending June 1972, research and clinical training programs, and the administrative organization of community psychiatry. To improve community psychiatry in Japan to its US level, innovations are suggested such as research centers, education and training centers, communication centers, and clinical centers in the national department of mental health facilities.—*S. Ashida.*

10282. van Buskirk, David. (South Shore Mental Health Ctr, Quincy, MA) **Training and treatment costs in a community mental health center.** *Administration in Mental Health*, 1974(Sum), 28-36.—Describes a method for defining and allocating training costs among different programs for different types of trainees. Using cost/unit of service, price tags are put on training programs within a community mental health center.

10283. Weinman, Bernard; Kleiner, Robert; Yu, Jin H. & Tillson, Vicki A. (Philadelphia State Hosp. PA) **Social treatment of the chronic psychotic patient in the community.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 358-365.—Investigated the clinical utility of community treatment of chronic psychotic patients. The outcome of a community treatment program was compared with results of 2 hospital-based control conditions: socioenvironmental therapy and traditional hospital treatment. Nonprofessional indigenous community members served as visiting or live-in enablers for 8-12 mo. Ss were 590 patients with an average age of 48.9 yrs and an average of 13.2 yrs of accumulated hospitalization. Results show that community treatment surpassed residential socioenvironmental treatment in release rates and in level of community performance as well as in the community tenure of patients placed in boarding settings. Both community and socioenvironmental treatment were clearly superior to traditional hospital ward programs in increasing

community tenure. In the community program, 52% of 242 Ss remained in the community for at least a 24-mo posttreatment period as compared to 38% of 246 Ss in socioenvironmental treatment. 102 Ss released from traditional wards incurred the highest return rate—41%.—*Journal summary.*

10284. Wesson, Donald R.; Smith, David E. & Linda, Lauren K. (West Coast Polydrug Abuse Treatment & Research Project, San Francisco, CA) **Drug crisis intervention: Conceptual and pragmatic considerations.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 135-142.—Discusses alternative techniques useful for drug crisis intervention. Areas covered include crisis definition; common approaches; crisis intervention agency types; street drug analysis; and medical management of adverse reactions to opiates, sedative-hypnotics, mixed opiate/sedative-hypnotics, stimulants, and psychedelics. Special emphasis is given to LSD crisis management. The therapeutic implications of crisis as a time of unusually high patient receptivity to assistance are considered.—*R. Tomasko.*

10285. Wildman, Robert W. & Wildman, Robert W. II. (Central State Hosp, Milledgeville, GA) **Administrative problems and patterns of agency clinical psychology departments.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 336-344.—Surveys requesting information on administrative patterns and problems were returned by 222 chief psychologists of mental health facilities. It was found that the majority believed that psychology departments should have a chief psychologist who has line authority over all psychology personnel and that psychology departments should have a central budget and control all expenditures in regard to personnel and other operating expenses. However, these desired conditions were found in only a minority of the responding departments. Major factors inhibiting the progress of psychology in mental health institutions were medical domination, inadequate budget, inadequate number of personnel, lack of understanding of the value of psychology, and insufficient authority for psychology personnel.—*Journal summary.*

10286. Zarle, Thomas H.; Hartsough, Don M. & Ottinger, Donald R. (Purdue U) **Tornado recovery: The development of a professional-paraprofessional response to a disaster.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 311-320.—Reports on a response to the emotional and social needs of disaster victims in the town of Monticello, Indiana, following severe tornado damage in April 1974. A project was developed which combined mental health and crisis intervention resources from outside the disaster community with paraprofessional workers indigenous to the area. Recovery efforts evolved into 3 distinct phases: (a) First, time was devoted to developing the program and to training paraprofessionals. (b) During the first months of recovery, response was focused on the victims and the acute effects of the disaster. (c) Finally, the needs of both victims and other members of the community were related to the long-term process of rebuilding. It is concluded that professional and paraprofessional workers can combine efforts successfully in a program grounded in crisis theory and crisis intervention techniques. However, valuable time

could have been saved by the availability of a guiding recovery plan and ready financial support.—*P. O'Brien.*

### Physical Treatment

10287. Asken, Michael J. (West Virginia U) **Psychemotional aspects of mastectomy: A review of recent literature.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 56-59.—Reviews the recent literature on the psychological reactions of mastectomy patients and on appropriate intervention strategies. Individual and familial fears and concerns related to mastectomy are discussed, and the importance of preoperative counseling and postoperative rehabilitation are emphasized. (22 ref)—*Journal abstract.*

10288. Berkwitz, Nathaniel J. **An up-to-date review of theories of shock therapies: Are convulsive shock therapies "moral treatments?"** *Diseases of the Nervous System*, 1974(Nov), Vol 35(11), 523-527.—Describes the history, current usage, and controversies surrounding treatment of psychological problems with electroconvulsive shock therapy (ECT). Issues such as the morality of this approach, explanations for its effectiveness, and various forms of the treatment are discussed. It is suggested that manic-depressive illness and involutional psychosis respond well to ECT. On the other hand, experience is cited in which ECT given to outpatients for the amelioration of depression, anxiety states, conversion hysteria, and in some ambulatory cases of acute schizoid reactions was not successful whereas treatment with Faradic or nonconvulsive therapy was helpful. (33 ref)—*R. S. Albin.*

10289. Berman, Mark L. **Application of contingency management: Considerations in a correctional setting.** *Educational Technology*, 1974(Apr), Vol 14(4), 20-27.—Describes a contingency management system in a correctional institution designed to prepare and qualify inmates to attend colleges as regular undergraduates. Reinforcements were provided in the form of points worth money and praise from peers and staff. Problems in the system are described, and suggestions for implementing similar systems in correctional institutions are given.—*C. B. Kreitzberg.*

10290. Bernstein, Dorothy M. & Simmons, Roberta G. (U Minnesota, Minneapolis) **The adolescent kidney donor: The right to give.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1338-1343.—Interviewed and administered the MMPI, WAIS, and WISC to 26 16-20 yr old potential and actual kidney donors. Results indicate that adolescent donors were more likely than adult donors to experience a boost in self-esteem and feel rewarded by, rather than regretful of, the decision a year later. 73% of the potential donors and 89% of the actual donors appeared to be under no family pressure to donate. Rescue of the terminally ill was the most frequently mentioned motive for donation, occurring 15 times, followed by concern and love for the recipient. The most prominent gain mentioned by almost all the donors was that of the gratitude of the recipient and family. All Ss had normal IQs except 1, and all but 2 had normal MMPI scores.—*L. Gorsey.*

10291. Cohen, Bertram D.; Penick, Sydnor B. & Tarter, Ralph E. (Rutgers State U, Medical School, Piscataway) **Antidepressant effects of unilateral electric**

**convulsive shock therapy.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 673-675.—Obtained Zung Self-Rating Depression Scale scores from 3 groups of depressed patients before and after 2 electric convulsive shock treatments (ECT). The ECT was administered bilaterally in 1 group and unilaterally, to the left- or right-cerebral hemisphere, in the other 2 groups. A 4th group was tested before and after the same interval but with no ECT. There were 10 patients in each group, all right-handed. All groups improved in mood, but the gain was significantly larger for right-hemisphere ECT than for either left- or bilateral-ECT. Comparisons with the no-ECT group, although nonsignificant, suggest that shock to the left hemisphere retards the antidepressant effects of ECT. It is speculated that right-hemisphere shock facilitates denial, while shock to the left-hemisphere interferes with verbally more complex means of processing dysphoric information defensively.—*Journal abstract*.

10292. **Cotton, Ester.** **Improvement in motor function with the use of conductive education.** *Developmental Medicine & Child Neurology*, 1974(Oct), Vol 16(5), 637-643.—Describes 2 cases of cerebral palsy whose progress in making active hand movements was felt to be due to the Peto method of conductive education. (French, German, & Spanish summaries)

10293. **Frankel, Fred H.** (Harvard U, Medical School, Boston) **Reasoned discourse or a holy war: Postscript to a report on ECT.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 77-79.—Points out that both favorable and unfavorable opinions regarding the value of electroconvulsive therapy (ECT) have become entrenched in the absence of adequate data. These opinions are discussed in relation to the training, experience, and personal orientation of the psychiatrist. The inability of some psychiatrists to tolerate uncertainty is held responsible for their denial of the validity of alternative methods of treatment. It is recommended that psychiatrists tolerate a certain amount of ambiguity and uncertainty; postponing closure may lead to the conclusion that treatment styles (including use of psychotherapy and ECT) are not mutually exclusive.—*Journal abstract*.

10294. **Hagberg, Bo & Malmquist, Ann.** (U Lund Hosp, Sweden) **A prospective study of patients in chronic hemodialysis: IV. Pretreatment psychiatric and psychological variables predicting outcome.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 315-319.—Studied psychiatric and psychological test assessments, made before hemodialysis began, of 23 patients with chronic renal failure, and compared results with treatment outcomes. Rehabilitated patients seemed to be more stable and to have an ability for positive identification and a persistency of life pattern. Further prognostically favorable variables were regular social contacts, adequate reaction towards kidney disease, expectation of fast rehabilitation, and use of defense mechanisms other than isolation.—*W. G. Shipman*.

10295. **Jones, Bill.** (U Queensland, St Lucia, Australia) **The importance of memory traces of motor efferent discharges for learning skilled movements.** *Developmental Medicine & Child Neurology*, 1974(Oct), Vol 16(5), 620-628.—Reviews methods of physiotherapy currently

used to improve movement control (especially in spastic children). It is argued that many of these methods may be ineffective because they are based on proprioceptive feedback theory. New methods need to be developed for teaching a child to monitor his own voluntary movements visually. (French, German, & Spanish summaries) (48 ref)—*P. W. Pruyser*.

10296. **Kohn, Bruno & Dennis, Maureen.** (York U, Downsview, Ontario, Canada) **Selective impairments of visuo-spatial abilities in infantile hemiplegics after right cerebral hemidecortication.** *Neuropsychologia*, 1974(Oct), Vol 12(4), 505-512.—8 14-28 yr old infantile hemiplegics with decortication of the left or right cerebral hemisphere were compared on tests of visuo-spatial abilities, of sense of direction and orientation, and of route-finding skills. The 2 hemidecorticate groups performed with similar competence if test requirements did not exceed capacities which normal children attain by the age of about 10 yrs. Unlike the left-operated group, right hemidecorticates were severely impaired on tests of later-developing spatial abilities. It is concluded that, after perinatal disease and hemidecortication of the right brain-half, left hemisphere control of processes underlying spatial analyses is associated with developmental deficits in these capacities. (French & German summaries) (19 ref)—*Journal abstract*.

10297. **Landis, Bernard; Baxter, James; Patterson, Russel H. & Tauber, Carl.** (State University Coll New York, Purchase) **Bender Gestalt evaluation of brain dysfunction following open-heart surgery.** *Journal of Personality Assessment*, 1974(Dec), Vol 38(6), 556-562.—The heart-lung machine makes open-heart surgery possible by providing extracorporeal blood circulation; however, it creates microemboli in the blood that cause neurological damage. A new filter, designed to remove these emboli, was assessed by preoperative and postoperative Bender Gestalt testing of 28 38-66 yr old patients. A lesser degree of the kinds of visual-motor difficulties associated with neurological deficit was produced by patients who received filtered blood. Postoperative impairment was assessed with some precision by using C. R. Pascal and B. J. Suttell's (1951) method of scoring distortions of Bender designs. The Bender scores were consistent with ultrasonic (sonar) counts of microemboli.—*Journal abstract*.

10298. **Malev, Jonathan S. & Landau, William.** (VA Hosp, Houston, TX) **Psychosis and informed consent: A brief communication based on a report of a case.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 7-9.—Discusses the problem of obtaining informed consent for treatment or surgery from a psychotic patient. In the case of parathyroid adenoma discussed, informed consent was finally obtained through the intervention of the patient's family doctor.

10299. **Malmquist, Ann & Hagberg, Bo.** (U Lund Hosp, Sweden) **A prospective study of patients in chronic hemodialysis: V. A follow-up study of thirteen patients in home-dialysis.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 321-326.—13 patients in home dialysis were psychiatrically evaluated before the start of dialysis and both psychiatrically and psychologically evaluated at the follow-up, using projective test

methods (Meta contrast technique and tachistoscopic exposure of a dialysis scene). The home-dialysis patient is much less disturbed emotionally by the treatment situation than the patient in center-dialysis. (19 ref)—*W. G. Shipman*.

10300. Nielsen, H. Birk & Ewertsen, H. W. (Bispebjerg Hosp, State Hearing Ctr, Copenhagen, Denmark) **Effect of hearing aid treatment.** *Scandinavian Audiology*, 1973, Vol 3(1), 35-38.—Studied the social hearing handicap index (SHI) in a group of 551 hard-of-hearing persons who were fitted with hearing aids for the first time. When relating the SHI to the speech reception threshold (SRT) in the better ear, it was found that the hearing handicap—as experienced by the Ss themselves—was at least as great as the physical hearing loss expressed in SRT values. It is concluded that the SHI gives supplementary information to objective measures. Applied to different diagnostic groups and type of tone audiogram, the SHI before and after treatment with hearing aids expressed the therapeutic gain, which was biggest in groups of Ss with conductive disorders and with flat audiograms. In relation to different age groups, the subjectively experienced therapeutic gain proved to be the same for young, middle-aged, and elderly Ss and somewhat less for Ss over 75 yrs of age.—*Journal abstract*.

10301. Pedersen, B.; Frankner, B. & Terkildsen, K. (Rigshospitalet, ENT Clinic F, Copenhagen, Denmark) **A prospective study of adult Danish hearing-aid users.** *Scandinavian Audiology*, 1974, Vol 3(3), 107-111.—Findings of a long-term study of hearing-aid users (89% were over age 50) indicated that 1/3 of them exhibited problems of a mental nature and that, in general, Ss who showed unsatisfactory adjustment to the aid were unmotivated to mobilize the extra effort needed to use the aid.

10302. Pfeiffer, Alfred. [Acupuncture and the science of medicine.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jun), Vol 26(6), 369-373.—Speculates on the probable existence of mechanisms for regulating transformation of energy in the central nervous system. Suggestion therapy in general is discussed, and the analgesic effects of acupuncture in particular.

10303. Pritchard, Michael. (London Hosp Medical Coll, England) **Dimensions of illness behaviour in long term haemodialysis.** *Journal of Psychosomatic Research*, 1974(Oct), Vol 18(5), 351-356.—The responses of 14 patients undergoing hemodialysis to a 22-item questionnaire were factor analyzed.

10304. Squire, Larry R.; Slater, Pamela C. & Chace, Paul M. (VA Hosp, San Diego, CA) **Retrograde amnesia: Temporal gradient in very long term memory following electroconvulsive therapy.** *Science*, 1975(Jan), Vol 187(4171), 77-79.—Used a newly designed remote memory test to assess the temporal dimension of prolonged retrograde amnesia. 16 22-66 yr old psychiatric inpatients given a course of electroconvulsive treatments for relief of depressive illness exhibited a temporal gradient of retrograde amnesia after 5 treatments. Memories acquired up to about 3 yrs before treatment were impaired, but memories acquired 4-17 yrs before treatment were not affected. Results suggest that the neural substrate of memory gradually changes with the

passage of time after learning and that resistance to amnesic treatment can continue to develop for years. (20 ref)—*Journal abstract*.

10305. Starkman, Monica N. & Youngs, David D. (U Michigan, Medical Ctr, Psychiatric Consultation-Liaison Service) **Psychiatric consultation with patients who refuse medical care.** *International Journal of Psychiatry in Medicine*, 1974(Spring), Vol 5(2), 115-123.—Ethical and pragmatic issues related to patient refusal of medical care are considered and a comprehensive approach to psychiatric evaluation and management is presented. Legal interventions which may be utilized are described. The medical-legal committee and the interdisciplinary case conference are suggested as avenues for dialogue, problem solving, and education.—*Journal abstract*.

10306. Steinhart, Melvin J. (Albany Medical Coll, Union U) **Psychiatric aspects and management of aging patient.** *New York State Journal of Medicine*, 1974(Jun), Vol 74(6), 976-978.—Discusses some special problems encountered by physicians in the treatment of geriatric patients. Although the physiological changes of aging sometimes result in cognitive disorders, perceptual difficulties, and personality alterations, it is important for the physician to remember that the elderly patient's needs for friendship, security, and integrity are basically the same as those of younger persons. It is suggested that physicians frequently react to the aged with unconsciously expressed fear, hostility, and condescension. It is concluded that a successful therapeutic relationship between the physician and geriatric patients requires cooperation from the patient and his family and flexibility on the part of the physician.—*J. Kelly*.

10307. von Euen, E. (U Freiburg, Medizinische Poliklinik, W Germany) [The psychology of diet behavior: Examinations of patients with kidney failure.] (Germ) *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1974(Jan), Vol 24(1), 31-35.—Studied 29 patients with chronic kidney failure who did not follow the low-protein diet prescribed for them, to determine the reasons for noncompliance. The degree of intelligence proved not to be a factor. The problem was attributed to circumstances unfavorable to staying on a diet, especially when circumstances are combined with such factors as the individual's susceptibility, disposition, attitudes, latency structure, etc. The basic problem of such a diet is the restriction of oral desires, which is seen as an offense to one's self-worth and is felt to be a recurrence of arbitrary parental demands. Case histories to illustrate this point of view are presented.—*S. D. Babcock*.

10308. Weinstein, Milton C. (Harvard U, School of Public Health, Ctr for the Analysis of Health Practices, Boston) **Allocation of subjects in medical experiments.** *New England Journal of Medicine*, 1974(Dec), Vol 291(24), 1278-1285.—Considers that randomized clinical trials have been a subject of much controversy for ethical reasons. When alternative experimental designs are judged on the basis of expected outcomes to the entire patient population, including the experimental Ss, it can be demonstrated that classical randomized designs need not be optimal. Consideration of individual patient preferences in a decision-analytic framework may lead to rejection of randomized trials in favor of alternative,

perhaps nonrandomized, designs. Moreover, the ethical problems of experimentation can be rendered less severe if adaptive designs are used—designs that make use of information obtained during the investigation—thus permitting meaningful inferences to be drawn while exposing fewer patients to the inferior treatment. For both statistical and ethical reasons, adaptive designs should be used more often, and strictly randomized designs should be used sparingly. (28 ref)—*Journal abstract*.

### Social Casework & Rehabilitation

10309. Angliker, Colin C. (McGill U, Montréal, Québec, Canada) [The training of prison guards.] (Fren) *Vie Médicale au Canada Français*, 1974(Jun), Vol 3(6), 602-604.—Notes some ways in which guards can be taught to support the rehumanization of the prison environment for their own as well as for inmates' benefit.

10310. Barney, Oscar R. (Georgia Regional Hosp, Augusta) **Client age, education, and work experience as predictors of rehabilitation outcome.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Mar), Vol 7(1), 25-30.—Analyzed results of a study of 40 vocationally impaired individuals referred to a work evaluation program in order to determine whether certain demographic factors (age, education, and previous employment) might serve as valid predictors of rehabilitation success. The disabilities included emotional problems, with several Ss having orthopedic, neurological, or cardiovascular disorders. The severely disabled (Ss with mental retardation, hemiplegia, or severe cerebral palsy) were excluded. Statistical results indicate that a background of 10 or more years of education is a significant factor in predicting rehabilitation outcome; the factors of age and previous employment are not significant.—*A. de la Haba*.

10311. Barry, John R.; Becker, Joel L. & Sonenshine, William J. (U Georgia) **Variables associated with rehabilitation prognosis and type of crime.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 392-401.—Describes a study which relates certain prisoner characteristics and experiences to (a) rehabilitation prognosis and (b) the kind of offense committed. The biographical data and rehabilitation experiences of over 600 prison inmates were compared with prognostic ratings made by 10 vocational rehabilitation counselors. Postprison follow-up data were available for 163 of these Ss which supported the validity of the prognostic ratings. 9 of the 60 characteristics and experiences were significantly associated with the prognostic ratings. For example, those Ss who lived in the rehabilitation center, who received more counseling-therapy, or who attended trade school were judged to have a better post prison prognosis than the other inmates. This prognostic judgment related significantly to post prison behavior.—*Journal summary*.

10312. Bloch, Carole S. & Gould, Wilbur J. (Lenox Hill Hosp, New York, NY) **Vocal therapy in lieu of surgery for contact granuloma: A case report.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 478-485.—Presents the case of a 42-yr-old male in which resolution of a contact granuloma was attained with vocal therapy and psychological support. It is concluded

that surgery should probably never be used as initial therapy for contact granuloma of the larynx, regardless of its presumed state of evolution.

10313. Bodenhamer, Randy. **Introducing the principles of contingency management into the work adjustment program: One approach.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Sep), Vol 7(3), 28-30.—Summarizes one method of introducing contingency management principles to supervisors in a work adjustment program of Goodwill Industries. The approach was used to promote the acceptance and implementation of these principles and appeared to be successful.

10314. Chevalier, Millie. **A review of Rankian with therapy and its relevance for social casework.** *Clinical Social Work Journal*, 1974(Fal), Vol 2(3), 194-206.—Examines the basis of Rankian treatment philosophy, partly through case examples.

10315. Collins-Ahlgren, Marianne. (Riverside Community Hosp, CA) **Teaching English as a second language to young deaf children: A case study.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 486-499.—Examined the development of a 3-yr-old deaf female's use of her native language of signs, and the emergence of English—a 2nd language—between the ages of 3 and 4.

10316. Corthell, David W. & Lesnick, Michael J. (U Wisconsin, Stout) **Observation and recording behavior.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Sep), Vol 7(3), 21-27.—Describes a narrative method for recording client behavior or performance by vocational evaluators and work adjusters. The method includes 7 steps of what, when, and how to record the information briefly and accurately.

10317. Couch, Robert H. & Allen, Conrad M. (Auburn U) **Attendance behavior of the disadvantaged: A comparison of tangible and intangible reinforcers.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Jun), Vol 7(2), 34-41.—Analyzed the statistical results of a study of 75 Ss to compare the effectiveness of tangible reinforcers with intangible reinforcers in increasing attendance behavior of disadvantaged rehabilitation facility clients. Ss were divided into 3 groups of 25. Group 1 was rewarded for attendance and punctuality with a token which could be exchanged for one of several tangible items in a facility store. Group 2 was rewarded with a token and verbal reinforcement, and was permitted 45 min in a recreational area. Group 3 (controls) was given no rewards for attendance. The 3 null hypotheses, which stated that there would be no significant difference in attendance rates among the 3 groups, were supported statistically by attendance and follow-up data. However, a directional nonsignificant trend and several indices favoring both experimental treatments was discerned. (17 ref)—*A. de la Haba*.

10318. Davila, Robert R. (Ed.). **Proceedings of the Fifth Biennial Conference of the Professional Rehabilitation Workers with the Adult Deaf.** *Journal of Rehabilitation of the Deaf*, 1974(Jul), Vol 8(1), 176 p.

10319. Deming, Romine R. (Northeastern U, Coll of Criminal Justice) **Valence as a measurement of the effectiveness of probation officer-client relationship.** *Journal of Criminal Justice*, 1974(Sum), Vol 2(2),

157-162.—Probationers are expected to be socialized or resocialized through the assumed "primary relationship" which is supposed to occur by randomly assigning probationers to officers. A Likert-type scale was developed to assess the necessary ingredient of a primary group—relationship valence—and was administered to 100 clients (male delinquents aged 12-18 yrs) of an urban probation agency. The assumption was supported. However, evidence suggests possible improvement through planned matching of clients to officers based on client and officer personality profiles. The Relationship Valence (RV) Scale facilitates this matching as well as assists in officer development and program evaluation. The RV Scale can be used as a research instrument to compare high and low scorers and also to enhance a greater understanding of officers by comparing officers who elicit high scores with those who elicit low scores. (21 ref)—*Journal abstract*.

10320. Hindman, Ross L. (St Edward's U) **Preparing the sheltered worker for a competitive work setting.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Mar), Vol 7(1), 20-24.—Discusses the need to prepare the sheltered worker for the realities of the actual work world. This includes teaching him to accept and understand the interaction with other workers that will occur during the first days on the job. Very often the retarded or disabled worker has been encouraged to be an overly enthusiastic producer and this can place him in serious conflict with the established work patterns of other workers on the new job. What happens during the initial work period is crucial to the sheltered worker's self-image and it is important that he be prepared to adjust to the prevailing work production situation in order to avoid psychological pressure and attack from his fellow workers.—*A. de la Haba*.

10321. Kaplan, Mildred F. **Counseling middle-class university students.** *Social Casework*, 1974(Oct), Vol 55(8), 484-488.—Demonstrates how clinical social work can be helpful to psychologically sophisticated, middle-class university students.

10322. Lechowicz, Joseph S. & Carmack, Nathan D. (St John's U, Jamaica, NY) **Systematic approach to client care in a rehabilitation facility: Adaptation of a medical model.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Mar), Vol 7(1), 14-19.—Discusses the L. L. Weed System, as modified by J. W. Hurst (1971), of client care in a sheltered workshop. The medical model devised integrates the data-collection and problem-solving services of all personnel in the facility and includes the following sequential steps: (a) data base, including diagnosis, problems, and sequence of events; (b) complete problem list; (c) initial plans and orders; (d) progress notes; and (e) discharge notes. A system of numerical codes includes information on general education; social, personal and medical history; and test and psychological profiles. This permits the placement of the client in an appropriate treatment atmosphere. The system enables helping personnel to acquire a complete overview and eliminates unnecessary duplication of efforts. It also provides for a more honest assessment of the quality of client care.—*A. de la Haba*.

10323. Lord, John C. (Dalhousie U, School of Physical Education, Halifax, Nova Scotia, Canada)

**Helping children help themselves: A clinical approach.** *Journal of Leisurability*, 1974(Jul), Vol 1(3), 4-8.—Describes the objectives and programs of the Children's Developmental Clinic at Dalhousie University, Halifax, Nova Scotia. The clinic treats children aged 6-12 with perceptual-motor disabilities and also conducts research and training functions. Gains in self-confidence and variable perceptual-motor improvements are reported to result from treatment emphasizing physical activity.

10324. Miller, James H. & Alfano, Anthony M. (U Tennessee) **The efficacy of Tennessee rehabilitation facilities: A counselor critique.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Mar), Vol 7(1), 31-37.—Surveyed 60 rehabilitation counselors to determine the efficacy of Tennessee's metropolitan rehabilitation facilities. Questionnaires requested information on (a) style, length, and dispatch in reporting of client data; (b) specificity; (c) potential value and performance rating of evaluative data; (d) counselor familiarity with services provided by local facilities; (e) facility services; and (f) usefulness of evaluative tools. Results indicate that the counselors regarded the rehabilitation services very favorably. Suggested improvements included more rapid return of evaluation reports to counselors; more contact between counselors and facilities to promote a better understanding of the facilities' services and methodologies; greater familiarization of facility personnel with local job opportunities, providing for the development of relevant work samples and worker station assignments; and a 2-way feedback system between counselors and facilities.—*A. de la Haba*.

10325. Mongeau, Maurice. (Inst de réhabilitation, Médecine physique et réadaptation, Montréal, Québec, Canada) **[Rehabilitation of the physically disabled child.]** (Fren) *Vie Médicale au Canada Français*, 1974(Apr), Vol 3(4), 354-356.—Stresses the importance of a positive, realistic approach for the physically disabled child from the start, so that the child will interact and compete as normally as possible in the family, in school, and in society. (English summary)

10326. Muleski, Marilyn. (Ministry of Community & Social Service, Sport & Recreation Bureau, Toronto, Ontario, Canada) **Play and the hospitalized child.** *Journal of Leisurability*, 1974(Jul), Vol 1(3), 22-27.—Defines the function of the "child life worker," who deals with the emotional and psychological problems of hospitalized children. The cathartic and social values of play therapy are emphasized. Environmental factors that can facilitate children's adjustment to hospitalization are described, and outdoor play is recommended.

10327. Norlin, Judy & Ho, Man Keung. (U Oklahoma, School of Social Work) **A co-worker approach to working with families.** *Clinical Social Work Journal*, 1974(Sum), Vol 2(2), 127-134.—Examines the advantages and disadvantages of the coworker approach. A strong argument is made in favor of using this method despite its limitations, which are pointed out. Significant details related to the process are given.

10328. Odell, Brian N. (U Wisconsin, Madison) **Accelerated entry into the opportunity structure: A sociologically-based treatment for delinquent youth.** *Sociology & Social Research*, 1974(Apr), Vol 58(3) 312-317.—Evaluated 2 psychologically-based

and 2 sociologically-based treatment programs serving 60 lower-class, persistently offending delinquent boys (44 nonwhite, 16 white). The psychological programs consisted of casework with the youths and their families; the sociological offered educational development and job placement. Results indicate that the sociological programs were significantly more effective than the case-work programs in reducing recidivism, enabling more of the delinquents to enter the "opportunity structure" (regular employment after high school). This entry was accompanied by improved self-images and identification with more "traditional" reference groups.—*R. V. Heckel.*

10329. **Perlman, Helen P.** (U Chicago, School of Social Service Administration) **Confessions, concerns, and commitment of an ex-clinical social worker.** *Clinical Social Work Journal*, 1974(Fal), Vol 2(3), 221-229.—Describes the social work profession in terms of its uniqueness and the sense of professional identity acquired by its members.

10330. **Pittel, Stephen M.** (Wright Inst, Berkeley Ctr for Drug Studies, CA) **Addicts in wonderland: Sketches for a map of a vocational frontier.** *Journal of Psychedelic Drugs*, 1974(Apr), Vol 6(2), 231-241.—Discusses the "street work" behavior of the drug addict, and its implications for his vocational rehabilitation. Many job skills addicts possess are seen to have been acquired after they started to abuse drugs. It is suggested that an addict's street routines be analyzed when assessing his postaddiction vocational possibilities. Suggestions regarding vocational assessment, training, job design, and the addict's entry into a new social environment are presented. (21 ref)—*R. Tomasko.*

10331. **Rees, Stuart.** (Aberdeen U, Scotland) **No more than contact: An outcome of social work.** *British Journal of Social Work*, 1974(Fal), Vol 4(3), 255-279.—Describes how social worker and client perspectives on various aspects of their meetings are related to one or all of several outcomes of treatment (e.g., failure to give a service, failure to perceive the social worker's role, or the failure to continue to seek help). The author's experiences with 8 sets of clients are described to illustrate how the outcome in each case is a reflection of each party's interpretations of crucial aspects of the meetings. Although this may reflect a 1-sided picture of the practice of social work, it is argued that it also emphasizes the process in which past and present circumstances affect both parties' perspectives of the therapeutic contact and how these circumstances increase the probability that the clients will either fail to obtain help or regard their meetings with social workers as no different from other passing contacts with "officials" who feature in their lives. (28 ref)—*Journal abstract.*

10332. **Remmes, Harold.** (Massachusetts Council of Organizations of the Handicapped, Boston) **Consumer feedback: Tiny Tim is dead!** *Rehabilitation Literature*, 1974(Oct), Vol 35(10), 298-300.—Cites personal experience as head of the Consumer Advocacy Project as a basis for urging greater cooperation between the providers and recipients of rehabilitation services for handicapped persons.

10333. **Rullman, Lee.** (Metropolitan Toronto Assn for the Mentally Retarded, Ontario, Canada) **Adapted**

**activities and the handicapped.** *Journal of Leisurability*, 1974(Jan), Vol 1(1), 15-19.—Discusses activities that can be modified for participation of the handicapped without changing their original purpose (e.g., wheelchair basketball). Case histories and suggestions for modifying activities to fit abilities rather than disabilities and allow the handicapped to participate in a wide range of activities are presented.

10334. **Rusche, Philip J.** (Northeastern U, Graduate School of Education) **Feedback: An organizational imperative.** *Rehabilitation Literature*, 1974(Oct), Vol 35(10), 290-297, 300.—Emphasizes the importance to a social service agency of feedback from those whom the organization serves and from the community in which the agency functions.

10335. **Skelly, Madge; Schinsky, Lorraine; Smith, Randall W. & Fust, Rita S.** (VA Hosp, St Louis, MO) **American Indian sign (Amerind) as a facilitator of verbalization for the oral verbal apraxic.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 445-456.—6 oral and verbal apraxic adult patients with no speech on admission to a clinical study project achieved varying degrees of verbalization with American Indian Sign as a synchronous facilitator. Gains were measured by comparing patients' verbal scores on the Porch Index of Communicative Ability on entering and leaving the project. Family and hospital observers noted improvement in the patient's daily spontaneous speech.—*Journal abstract.*

10336. **Stockton, Michael D. & Foreyt, John P.** (Florida State U) **The hospital hires its own: Ex-patients as employees.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Sep), Vol 7(3), 31-34.—Compared the work adjustment of 12 expatients of a mental hospital hired as full-time employees by the hospital with a control group of 12 nonpatients hired at the same time. No difference was found in either supervisors' ratings or comments about job performance.

10337. **Wodarski, John S. & Feldman, Ronald A.** (Washington U) **Practical aspects of field research.** *Clinical Social Work Journal*, 1974(Fal), Vol 2(3), 182-193.—Describes experience obtained from implementing a project concerning behavioral change within children's groups. The most important prerequisite for planning a project is the researcher's evaluation of the agency's operations before the study begins. What research questions can be answered by the study within the given context? Can mutual exploration of research objectives and consensus be obtained? Proper coordination, collaboration, monitoring of the study, and other important practical planning aspects are discussed.—*S. R. Stein.*

#### Hospital Programs & Hospitalization & Institutionalization

10338. ———. [22nd symposium of the Kyushu Neuropsychiatric Association: Topics on geriatric wards.] (Japn) *Kyushu Neuro-psychiatry*, 1973(Dec), Vol 19(3-4), 189-212.—Reports 4 symposium papers. (a) Results of clinical examinations of 1,104 geriatric patients are presented and appropriate geriatric ward setups are suggested. (b) A paper based on 20 mo of experiences in a geriatric ward discusses problems

peculiar to such a ward, the design of new wards, and problems in geriatric nursing, clinical examinations, and safety. (c) A paper on communicable diseases among mentally ill senile patients reports various causes of death, bacterial counts in hospital rooms, culture counts of mouth and throat viruses, and major communicable diseases among these patients. (d) A paper on the use of the creative arts, especially painting and ceramics, in a geriatric ward reports schedules, methods, and case studies of a successful program of art therapy.—S. Ashida.

10339. Baker, Joseph J. (VA Central Office, Mental Health & Behavioral Sciences Service, Washington, DC) **New perspectives in psychiatry in the Veterans Administration.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 70-73.—Discusses the mental health services in the Veterans Administration (VA) which, in 1972, were reorganized in a manner designed to increase the probability of interdisciplinary collaboration. VA hospitals were urged to form multidisciplinary mental health committees to advise on local programs and practices. This "corporate" approach has led to significant changes in the use of staff and in the physical and psychological environment in some hospitals. While it is too early to evaluate the full impact of the changes on patient care, waiting lists have been reduced, and length of hospital stay has decreased.—*Journal abstract*.

10340. Boudewyns, Patrick A. (VA Hosp, Iowa City, IA) Is "milieu therapy" in a short-term inpatient psychiatric setting worth the money? *International Mental Health Research Newsletter*, 1974(Sum), Vol 16(2), 7-8.—Evaluated lasting behavioral benefits of short-term milieu therapy (MT). Ss were 36 volunteer male inpatients less than 50 yrs old having MMPI peaks on D or Pt; each was randomly assigned to 1 of 3 short-term therapy groups—implosive therapy (IT) plus MT, desensitization therapy (DT) plus MT, and MT only—and completed the MMPI and Mooney Problem Checklist pre- and posttherapy and 6 mo later. Ss and significant others also rated therapeutic achievement toward individual goals. Results of *t*-tests showed that Ss receiving only MT displayed no significant pre-post or pre-follow-up changes on any measures. Of 8 MT Ss surveyed 1 yr after discharge, 4 had re-entered the hospital at least once. Findings for IT and DT Ss were significantly better. Despite absence of an untreated control group, the findings indicate that short-term MT alone was ineffective and suggest that in view of its cost, controlled studies of its effects should be carried out before its use in short-term programs is continued.—C. A. Heikkinen.

10341. Bourestom, Norman & Tars, Sandra. (VA Hosp, St Cloud, MN) **Alterations in life patterns following nursing home relocation.** *Gerontologist*, 1974(Dec), Vol 14(6), 506-510.—Compared the effects of a radical involuntary relocation of elderly patients with the effects of a moderate involuntary relocation. A total of 98 Ss in the 2 groups were matched with a like number of nonrelocated controls. The radical relocation required S adjustment to new staff, a new program, a new physical environment, and a new patient population; the moderate relocation involved only a move to a new building several hundred yards away. Findings indicate a

strikingly higher mortality rate for the relocated groups than for their nonrelocated counterparts. This rate was notably greater for the radical-change group, which showed a 43% mortality rate in the 6 mo preceding the year following relocation compared with 21% of controls. The moderate-change group experienced a 37% death rate compared with 26% among their controls. On all measures the radical-change group fared more poorly than did the moderate-change group, confirming that a weighty source of the variance in relocation effects is the degree of environmental change involved. (20 ref) —*Journal abstract*.

10342. Chapman, Marvin. (Central State Hosp, Wau-pun, WI) **The right to treatment and the institution.** In L. M. Irvine, T. B. Brelje (Eds), *Law, psychiatry and the mentally disordered offender: I*. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.—Discusses the historical, philosophical, and legal antecedents of the right to treatment, to determine whether individuals confined to a mental hospital have an enforceable right to treatment. Relevant court decisions are summarized, and it is concluded that the major implication of the right of treatment issue is that institutional interference in any area of personal liberty requires legal justification.

10343. Cleland, Charles C. & Sluyter, Gary V. (U Texas, Austin) **The Alabama decision: Unequivocal blessing?** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 409-413.—Explores implications of the Alabama *Wyatt vs Stickney* case in terms of budget conflicts, economics, effects of growth, and rate of growth. It is concluded that administrators will need to exercise great skill in implementation of an overly simplified legal decision.

10344. Ferrel, L. & Guyer, E. (VA Hosp, North Little Rock, AK) **Evaluation of a milieu therapy program for chronic hospitalized patients.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 18-19.—Compared pre- and posttest scores on the Anxiety Scale of the Institute for Personality and Ability Testing and on the Nurses' Observation Scale for Inpatient Evaluation (NOSIE), using 33 patients in a 6-mo treatment test of milieu therapy. Ss showed a significant increase in social interest and a decrease in manifest psychosis and depression as assessed by the NOSIE, but little or no change in the anxiety scores.

10345. Fields, Francis R. & Tumilty, Thomas N. (VA Hosp, Lebanon, PA) **A patient-centered approach to a beginning program for improvement of veteran-employee relations.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 5-9.—Implemented 2 separate programs in an attempt to improve employee-veteran relations. One was primarily didactic and included only employees. The other included both patient participation and more active staff involvement. Surveys indicated that, in general, employees' and patients' views regarding patient treatment were congruent, although consistent discrepancies between staff and patient responses were noted. These discrepancies tended to diminish after the program.

10346. Fleming, Juanita W. (U Kentucky, Coll of Nursing) **Hospitalized physically disabled children focus on things not people.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 1002.—Assessed the reactions of

136 5-12 yr old hospitalized children and children who had never been hospitalized using 6 projective pictures depicting events and people related to the hospital environment. Ss who were physically disabled focused on objects in the pictures rather than on people, while Ss who were either chronically or acutely ill focused on both objects and people, and controls focused on people.

10347. Foster, Leslie L. (VA Hosp, American Lake, Tacoma, WA) **A comparison of staff ratings related to posthospital adjustment.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(Aug), Vol 16(3), 11-14.—Explored the relationship between staff ratings of clients and their later adjustment. Factor analysis of a staff questionnaire gave 2 factor scores which were correlated to 9 scores from the Personal Adjustment and Role Skills Scale. Results show that the nonprofessional male rater was just as accurate as other staff in predicting a client's posthospital adjustment.

10348. Frank, John L. & Herndon, James H. (Hahnemann Medical Coll & Hosp, Philadelphia, PA) **Psychiatric-orthopedic liaison in the hospital management of the amputee war casualty.** *International Journal of Psychiatry in Medicine*, 1974(Spr), Vol 5(2), 105-114.—Describes methods of effecting a psychiatric liaison with an orthopedic service for amputee war casualties. Case examples are presented.

10349. Frankel, Alan & Murphy, John. (VA Hosp, Research Service & Rehabilitation Medicine Service, Salem, VA) **Physical fitness and personality in alcoholism: Canonical analysis of measures before and after treatment.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1272-1278.—Evaluated physical fitness and MMPI scores of 214 28-56 yr old male alcoholics before and after an 84-day treatment program that included a daily 1-hr physical fitness session. Ss were all of low socioeconomic status and generally in poor health. At the end of the program, Ss had significantly lower mean resting pulse rates and diastolic blood pressure, had gained weight, and had improved scores on a physical fitness test. Significant changes on the MMPI indicated that Ss had become less antisocial and less blame-projecting and that there had been decreases in neurotically anxious-depressive affect. When scores were weighted to control for scores at admission, major changes were on the physical fitness test and systolic blood pressure and on the D and Pa scales of the MMPI. (15 ref)—*Journal abstract*.

10350. Gottesman, Leonard E. & Bourestom, Norman C. (Philadelphia Geriatric Ctr, PA) **Why nursing homes do what they do.** *Gerontologist*, 1974(Dec), Vol 14(6), 501-506.—Describes an observation-based study of actual nursing home behavior which shows that, among 1,144 residents, half needed little assistance with activities of daily living and half were mentally alert. Little of nursing care was provided, suggesting a refocusing of care.

10351. Greve, W. (Schlosspark Clinic, Berlin, W Germany) **[Psychiatry in general hospitals: Possibilities and limits.]** (Germ) *Praxis der Psychotherapie*, 1973(Jun), Vol 18(3), 118-123.—Describes the program and progress of the Schlosspark-Klinik of West Berlin.

10352. Groisman, Moyses. **[Therapeutic community and teaching groups.]** (Port) *Jornal Brasileiro de Psiqui-*

*atria*, 1972(Jan), Vol 21(1), 81-91.—Describes an inpatient therapeutic community in which a team of experienced patients are made responsible for guiding newer patients through successive typical group crises. The "teaching group" itself receives guidance from a supervising psychoanalyst. (English summary)

10353. Harris, Joan M.; Velt, Steven W.; Allen, George J. & Chinsky, Jack M. (U Connecticut) **Aide-resident ratio and ward population density as mediators of social interaction.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 320-326.—Observed various types of interpersonal interaction between 37 institutionalized retarded children (mean age = 9 yrs) and 18 attendants under different ward populations and resident-aide ratios. High population density alone was not associated with decreases in the general quality of aide-initiated interactions with residents when resident-aide ratio was held constant. Lowering the resident-aide ratio by adding a 2nd attendant to a moderately populated ward did not change the behavior of either aide. Decreasing the resident-aide ratio when 1 aide was present, by decreasing the resident population, was associated with significant increases in the frequency of desirable types of aide behavior. These findings suggest that attendants might be most effective when working alone with a small group of residents.—*Journal abstract*.

10354. Heskin, K. J.; Bolton, N.; Smith, F. V. & Banister, P. A. **Psychological correlates of long-term imprisonment: III. Attitudinal variables.** *British Journal of Criminology*, 1974(Apr), Vol 14(2), 150-157.—Administered a semantic differential test to 175 men serving indeterminate sentences or determinate sentences of at least 10 yrs in English prisons in order to assess attitudes to concepts selected either because of their relevance to the experience of imprisonment or because of their general importance. Ss were divided into 4 groups, matched for age but differing in mean total time imprisoned. Self-evaluation was found to decrease significantly with imprisonment. Evidence presented supports the contention that imprisonment itself, rather than release-selection procedures, was responsible for this trend. There was some evidence that increasing imprisonment was associated with more unfavorable attitudes to the concepts of "work" and "father." These changes might be a consequence of the breakdown of relationships between prisoners and their families. (19 ref)—*Journal summary*.

10355. Howard, Ephraim M. & Howard, Joyce L. (Inst of Human Ecology & Living Processes, Bucks County, PA) **Women in institutions: Treatment in prisons and mental hospitals.** In V. Franks & V. Burtie (Eds). *Women in therapy: New psychotherapies for a changing society*. New York, NY: Brunner/Mazel, 1974. xiii, 441 p. \$15.

10356. James, Edassery V.; Armatas, James P. & Gump, Paul V. (Greenville Coll) **Ward behavior of patients.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 21-23.—Observed patient behavior on 4 hospital wards to determine influences of different treatment objectives, effects of the behavior of other individuals, and effects of the physical milieu. Assuming activity and sociality to be important in total treatment, results reveal insensitivities in hospi-

tals to the needs of older, chronic, or less competent patients.

10357. Kaltreider, Nancy B.; Martens, Wilma; Monterrosa, Susan & Sachs, Lewis. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **The integration of psychosocial care in a general hospital: Development of an interdisciplinary consultation program.** *International Journal of Psychiatry in Medicine*, 1974(Spring), Vol 5(2), 125-134.—Describes the process of changing from a traditional psychiatric consultation to one in which representatives from psychiatry, psychology, social work, and nursing worked to carry out a coordinated plan to provide psychosocial consultation to a general hospital. A case example is provided.—*Journal abstract*.

10358. Kiger, Roger S. (Utah State Hosp, Provo) **The therapeutic community in a maximum security hospital: Treatment implications.** In L. M. Irvine, T. B. Brelje (Eds), *Law, psychiatry and the mentally disordered offender*. I. Springfield, IL: Charles C Thomas, 1972. xv, 147 p. \$9.75.

10359. Lieberman, Morton A. (U Chicago) **Relocation research and social policy.** *Gerontologist*, 1974(Dec), Vol 14(6), 494-501.—4 studies examining factors predicting the effects of relocation on the elderly are discussed. 3 major strategies used to alleviate the stress of elderly persons entering institutions or transferring from one institution to another are examined—selection, preparation, and environmental manipulation.

10360. Markson, Elizabeth W. (Massachusetts Dept of Mental Health (Research), Boston) **The emperor's new clothes: A case study of instability on a geriatric service.** *Gerontologist*, 1974(Dec), Vol 14(6), 472-475.—Results of a case study on the geriatric service of a mental hospital suggest that staff disagreement on ward norms and daily activities provides a useful indicator of instability within the social system of a hospital.

10361. McCollough, Thomas E. (Duke U) **Mental illness and public policy.** *Journal of Religion & Health*, 1974(Oct), Vol 13(4), 251-258.—Summarizes recent federal and state legislation that requires more humane treatment for mentally ill patients. Voluntary hospital commitments and the right to treatment are particularly emphasized. Religious groups are admonished to oppose subcultural group treatment of mentally ill patients and to work toward developing more positive community attitudes toward emotionally deviant individuals.—*F. A. Hardt*.

10362. Mendel, Julius G. (Long Island Jewish—Hillside Medical Ctr, Queens Hosp Ctr, NY) **Utilization of outpatient psychiatric consultation services.** *New York State Journal of Medicine*, 1974(Jul), Vol 74(8), 1413-1414.—Reports that availability of a psychiatrist in a hospital outpatient medical clinic increases requests for psychiatric consultation, but that rate of follow-through with psychiatric treatment is low. It is suggested that patients who seek medical help for essentially emotional problems do not respond to conventional psychiatric intervention.

10363. Miketić, Božidar. (Medical Ctr, Dubrovnik, Yugoslavia) **[Prevention of psychic disturbances in old people in a home for the aged.]** (Srce) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(3), 61-65.

10364. Morrice, J. K. (Ross Clinic, Aberdeen, Scotland) **Life crisis, social diagnosis, and social therapy.** *British Journal of Psychiatry*, 1974(Oct), Vol 125, 411-413.—Examined data from 266 consecutive admissions to a day hospital run as a therapeutic community, which was previously described by the author (see PA, Vol 50:7447). 490 crises for these patients were identified, with the majority falling into 1 of 2 categories: interpersonal difficulties in the family and work problems. Problems in identifying the appropriate "social prescription" for the patients are noted, and the types of treatment offered (including group psychotherapy, family therapy, and encounter groups) are briefly outlined. Findings support the idea of social crisis as a precipitant of mental illness and the value of intervention which takes full account of social relationships.—*L. Gorsey*.

10365. Orvin, George H. (Medical U South Carolina) **Intensive treatment of the adolescent and his family.** *Archives of General Psychiatry*, 1974(Dec), Vol 31(6), 801-806.—Describes a specialized inpatient program developed for the study, teaching, and treatment of psychiatric disorders in the adolescent. It presents a conceptual framework of function and impairment by which the adolescent is evaluated and from which his treatment goals are evolved. The philosophy of admission stresses early and clearly defined requirements for patient, family, and staff. Parents and family participate in the treatment program at several different levels, including individual psychotherapy, couples therapy, family therapy, and family group therapy. A self-discharge plan emphasizes the adolescent's participation in the decision. (20 ref)—*Journal abstract*.

10366. Patil, C. B. **Correctional strategy of social defence.** *Social Defence*, 1972(Oct), Vol 8(30), 5-13.—Suggests the remodeling of the staffing of correctional institutions in India. Tasks performed should be re-examined, qualifications should be assessed, and the integration of services should be carried out.

10367. Perrucci, Robert. (Purdue U) **Circle of madness: On being insane and institutionalized in America.** Englewood Cliffs, NJ: Prentice-Hall, 1974. xiv, 176 p. \$7.95(cloth), \$2.95(paper).—Based on the author's fieldwork in a mental hospital for 1 yr, the processes of becoming mentally ill, being mentally ill, and becoming normal again and their relation to communal definitions and relationships are discussed. The idea of the mental hospital as a closed, caste-like society is examined, and it is argued that mental patients are victims rather than disease carriers who are bound to their caretakers by a shared stigma.

10368. Plutchik, Robert et al. (Albert Einstein Coll of Medicine, Program Development & Clinical Research, Yeshiva U) **Effects of transfer of chronic patients to a short-stay hospital.** *Psychiatric Quarterly*, 1974, Vol 48(2), 256-265.—Compared 143 chronic patients transferred from a suburban state hospital to an urban short-term state hospital with (a) patients similar in age, diagnosis, and sex who were admitted directly to the urban hospital; and (b) patients similar in age, diagnosis, and sex who were not transferred from the suburban hospital. Results show that the transferred patients were rated as more severely ill than patients in the other 2 groups and a greater percent exhibited symptoms such as

social withdrawal and isolation. 14 mo after the transfer, 72% of the directly-admitted patients had been discharged, 35% of the transferrees had been discharged, 5% of the nontransferred patients had been discharged, and 23% of the directly-admitted discharges had been readmitted.—*Journal abstract.*

10369. **Ralph, Donald E.; Hirschowitz, Ralph G. & Schrader, Jerry.** (Kentucky Bureau for Health Services, Northeastern Region, Lexington) **Breaking the logjam: A program of issue-focused intervention in a state hospital system.** *Psychiatric Quarterly*, 1974, Vol 48(2), 169-183.—Describes an intervention program which was designed for staff in hospital care services who saw a need for improved services for patients. The program improved communication throughout the system and helped increase awareness of possible community liaisons, but did not substantially change the administrative apparatus.

10370. **Reich, Louis H. & Weiss, Brian L.** (US Air Force Medical Ctr, Keesler Air Force Base, Biloxi, MS) **The clinical research ward as a therapeutic community: Incompatibilities.** *American Journal of Psychiatry*, 1975(Jan), Vol 132(1), 48-51.—Using information gathered in a 26-bed clinical psychiatric ward, the numerous incompatibilities between the ward, with its emphasis on the collection of baseline and treatment data, and the therapeutic milieu environment, with its emphasis on an open door, team orientation, and nonauthoritarianism are discussed. It is posited that the 2 orientations may be mutually destructive and that the therapeutic milieu may not be the best treatment setting for patients with schizophrenic or certain affective disorders. 2 case histories illustrating these ideas are included. (26 ref) —*Journal abstract.*

10371. **Scheerenberger, R. C.** (Central Wisconsin Colony & Training School, Madison) **A model for deinstitutionalization.** *Mental Retardation*, 1974(Dec), Vol 12(6), 3-7.—Discusses 5 aspects of a viable deinstitutionalization program for the retarded—local boards, a standard-setting and monitoring agent, back-up services and support, adequate financial resources, and a legal advocacy system.

10372. **Sturm, Richard J.** (VA Hosp, Roseburg, OR) **Patient attitudes toward admission.** *Newsletter for Research in Mental Health & Behavioral Sciences*, 1974(May), Vol 16(2), 3-5.—Received from 27 patients a completed questionnaire indicating what attitudes and behavior by the hospital staff were most important to patients during admission procedures. Friendly and courteous treatment headed the 15-item list. Patients also want someone to take charge and get things done, and they want simple, direct answers to questions.

10373. **Szasz, Thomas S.** (State U New York Hosp, Upstate Medical Ctr, Syracuse) **Psychiatry: A clear and present danger.** *MH*, 1974(Spring), Vol 58(2), 17-20.—Proposes that involuntary psychiatric hospitalization and treatment in the name of mental illness is an affront to the concept of civil liberty and due process. It is suggested that the public's awareness of the results of various questionnaires completed by a sampling of psychiatrists about their views in selected areas will be a factor in weakening support for an untenable position.

10374. **Talbot, John A.** (Dunlap-Manhattan Psychiatric Ctr, NY) **A study of readmissions to a state hospital.** *Psychiatric Quarterly*, 1974, Vol 48(2), 159-168.—Studied 100 consecutive readmissions to a state psychiatric hospital. It was judged that 84 might have been prevented, and that almost half of these might have been prevented with minor improvements of existing services necessitating no additional expenditure of money. 5 brief case studies are included to illustrate the various types of preventable and nonpreventable readmissions.—*Journal abstract.*

10375. **Upadhyay, R. K.** (Hosp for Mental Diseases, Post-Graduate Training Ctr, Ranchi, India) **A study of the attitude of newly hospitalised mental patients towards their hospitalisation and homes.** *Indian Journal of Psychiatric Social Work*, 1972(Jul), Vol 1(1), 21-28.—Studied the attitudes of 100 male patients recently admitted to a mental hospital. Findings indicate that social stigma was the major reason for resistance to hospitalization and that those who were voluntarily admitted responded better to treatment than those who came unwillingly.

10376. **White, W. C.; McAdoo, Wm. George & Phillips, Leslie.** (Cornell U) **Social competence and outcome of hospitalization: A preliminary report.** *Journal of Health & Social Behavior*, 1974(Sep), Vol 15(3), 261-266.—To evaluate the impact of hospitalization on the posthospital social adjustment of state hospital patients, the Worcester Scale of Social Competence was administered to 159 psychiatric patients subsequent to hospitalization and 1 yr following discharge. Analysis of pre- to posthospitalization change scores revealed significant sex differences, particularly with regard to role orientation and adequacy with which leisure time was utilized. (22 ref)

## EDUCATIONAL PSYCHOLOGY

10377. **Bernauer, Margaret & Jackson, John H.** (Milwaukee Public Schools, WI) **Review of school psychology for 1973.** *Professional Psychology*, 1974(May), Vol 5(2), 155-165.—Evaluates the profession of school psychology in terms of its actual and potential contributions to ongoing educational innovation. Some of the more important trends in the development of education which relate to school psychology, such as the individualization of instruction and the incorporation of affective goals and techniques into curricula, are specified. The major areas of diagnosis, intervention, and consultation in the clinical practice of school psychology are considered with regard to their current status and to the problems and issues that must be resolved in order for school psychology to make the contribution to education of which it is capable. Other aspects of school psychology practice given similar consideration include the administration and supervision of psychological services and professional training and staffing. (18 ref) —*B. Lindsey.*

10378. **Furneaux, Desmond; Bynner, John & Murphy, John.** **Data analysis: Methods of educational enquiry.** Block 4. Bletchley, England: Open University Press, 1973. 159 p.—Examines methods for describing, tabulat-

ing, summarizing, and transforming a sample of data collected for a single variable; methods for interpreting the relationship between variables, and the process of generalizing sample findings to the population from which the sample comes. A detailed analysis of published research is also included.

10379. Olson, David R. (Ed.). **Media and symbols: The forms of expression, communication, and education: The seventy-third yearbook of the National Society for the Study of Education: I.** Chicago, IL: National Society for the Study of Education, 1974. xvii, 508 p. \$10.—Presents a collection of 18 discussion and review papers on the nature and educational consequences of communication and its various technologies. Papers are divided into 4 sections to analyze symbol systems as forms of expression and communication and their educational implications; the educational potential of various media (e.g., print, films, and computers) and the interaction between the medium, message, task, and learner; and the major problems facing educational institutions in teaching a society greatly affected by communication technology.

10380. Smith, M. Daniel. (U New Hampshire) **A mathematical model of instructional processes.** *Instructional Science*, 1975(Jan), Vol 3(4), 375-382.—Presents some basic postulates and theorems of a theory of instruction as a mathematical model. The postulates are interpretations of principles of learning, and thus descriptive, while the theorems present processes for bringing about changes in learners, and are prescriptive. Instructional operators are derived from the theorems and used along with additional postulates to build further theorems. Assumptions implicit in early postulates are formalized in later developments in order to begin to deal with the cognitive domain.—*Journal abstract.*

#### School Administration & Educational Processes

10381. American Academy of Arts & Sciences. (Boston, MA) **American higher education: Toward an uncertain future.** *Daedalus*, 1974(Fal), Vol 103(4), 345 p.—Presents an issue describing American higher education, its current tensions and its possible future. The special problems of blacks and of women are discussed, and the belief systems associated with different types of higher education are explored in depth.

10382. Bailey, Gerald D. (Kansas State U) **Verbal behavior models: Identifying change and direction of teacher interaction pattern styles.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 18-24.—Investigated whether or not the verbal interaction patterns between the teacher and pupils were modified after 2 yrs of independent teaching. 2 hypotheses were tested: (a) Teachers who exhibited high correspondence with the Inquiry Verbal Behavior Model (IVBM) during their student teaching would not alter their interaction styles significantly when they taught independently. (b) Teachers exhibiting low correspondence with the IVBM as students would not alter their interaction styles when they taught independently. The classroom verbal behavior patterns of the teachers were recorded by means of the Interaction Analysis System devised by N. A. Flanders (1960). Of the 5 teachers operating under the

1st hypothesis, only one shifted to low correspondence with the model. Of the 4 teachers operating under the 2nd hypothesis, 3 shifted to high correspondence with the model and one remained at low correspondence. The 1st hypothesis was thus confirmed and the 2nd was rejected.—A. J. Ter Keurst.

10383. Ballesteros, David. (California State U, Sacramento) **Community-based education: A program to improve home school communication.** *California Journal of Educational Research*, 1974(Nov), Vol 25(5), 281-288.—Discusses goals, management, training, and programs necessary to effectively develop a community-based education system. The importance of school personnel participation in home-school communication is emphasized, and examples of ways to increase community-school-home awareness and interaction are presented.

10384. Bloom, Benjamin S. (U Chicago) **Implications of the IEA studies for curriculum and instruction.** *School Review*, 1974(May), Vol 82(3), 413-435.—Describes the International Association for the Evaluation of Education Achievement (IEA), an organization of 22 national research centers engaged in the study of education. They have published studies dealing with mathematics achievement, science, reading comprehension, and literature. Future studies will deal with achievement in French as a foreign language, English as a foreign language, and civic education. Implications for curriculum and instruction from the major results of the IEA surveys are discussed in overall terms and in terms of the special needs and problems of individual countries. (16 ref)—C. K. Miller.

10385. Blumberg, Allen. (West Virginia Coll of Graduate Studies, Institute) **Training special education teachers to use new methods.** *Education & Training of the Mentally Retarded*, 1974(Apr), Vol 9(2), 78-82.—Trained special education teachers to use new methods and pass on their knowledge to other teachers working with the mentally retarded. 15 special education master teachers were trained in 3 new methods: operant conditioning, psycholinguistics, and programmed learning material. They, in turn, trained 47 special education teachers the theoretical understanding and the functional use of these methods. Results show that teachers in special education were (a) interested in learning new methods as long as these techniques were relevant to the classroom, (b) capable of assuming leadership roles for training other special education teachers, and (c) creative in developing innovative ideas for implementing new methods. It is concluded that, although new methods have been presented in conventional reading research studies and demonstrations, it cannot be assumed that special education teachers are adequately trained to use the methods. A higher priority is recommended for the reorganization of methods courses in teacher education programs.—P. O'Brien.

10386. Boydell, Deanne. (U Leicester, School of Education, England) **Teacher-pupil contact in junior classrooms.** *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 313-318.—Examined the nature of teacher contact with children in 6 informal junior school classrooms, using a specially designed observation instrument which focused on 3 methods of addressing children (as a class, in a small group, and privately) and

on 19 types of teacher conversation. Private, work-oriented contact predominated, but this was mainly task supervision with relatively little on the substantive content of children's activities. Most substantive contact was low-level and factual.—*Journal abstract.*

10387. Brown, David J.; Reschly, Daniel & Wasserman, Howard. (U Arizona) **Effects of surreptitious modeling upon teacher classroom behaviors.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 366-369.—Describes how 2 children were taught to change the classroom behavior of their teacher. Support for the new behavior was obtained from an "observer" whose purported role was to assess the degree of disruptive behavior in the classroom.

10388. Bullock, Lyndal M.; Dykes, M. Kay & Kelly, Thomas J. (U Florida, Program in Emotionally Disturbed & Socially Maladjusted) **Competency based teacher preparation in behavioral disorders.** *Exceptional Children*, 1974(Nov), Vol 41(3), 192-194.—Describes a conceptual model that includes various aspects of a training program for teachers of behaviorally disordered children. The model reflects levels of training that would be provided in the program, types of facilities available for field experiences, consumer needs, and a philosophical base.

10389. Cooper, E. S. & Ingleby, J. D. (MRC Unit on Environmental Factors in Mental & Physical Illness, London, England) **Direct observation in the infant-school classroom.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Oct), Vol 15(4), 263-274.—Describes a method for measuring certain aspects of classroom behavior using video recording equipment. The measure was designed to investigate the behavioral correlates of teachers' overall ratings on 1st-yr school-children, and differences between types of school. The methodological problems of filming and coding are discussed in detail, and results from a small sample ( $N = 14$ ) are presented which show that the measures developed are reliable and sufficiently sensitive to reveal significant correlates of teachers' ratings and school types.—*Journal summary.*

10390. Drabman, Ronald S. & Lahey, Benjamin B. (Florida Technological U) **Feedback in classroom behavior modification: Effects on the target and her classmates.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 591-598.—A behavior modification program that employed feedback with no additional contingencies was initiated and withdrawn in an ABAB design on a 10-yr-old target child within a classroom. The disruptive behavior of the target child as well as that of her peers was monitored. Additionally, the sociometric status of the target child was recorded. Finally, the positive and negative comments made to the target by her teacher and her peers were related to initiation and withdrawal of the feedback contingency. Results indicate that (a) feedback alone may be an effective behavior modification procedure; (b) the disruptive behavior of the target's classmates changed, even though they were not directly treated; (c) sociometric status of the target was altered by behavioral contingencies; (d) positive comments by classmates to the target increased; and (e) negative comments from the teacher to the target child decreased.—*Journal abstract.*

10391. Fairchild, Thomas N. (Cedar Rapids Community Schools, IA) **An analysis of the services performed by a school psychologist in an urban area: Implications for training programs.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 275-281.—Describes how a school psychologist in a large urban area spends his working day. A log of daily services performed indicates that approximately 40% of his time is spent on assessment, 25% on intervention, 12% on evaluation, and 24% on administrative matters. It is suggested that the training program for school psychologists should reflect these percentages.—*H. Kaczowski.*

10392. Frew, David R. (Gannon Coll) **The effectiveness of the academic president as a leader.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 3-6.—Surveyed 20 Ohio colleges by questionnaires sent to randomly-selected Ss from the categories of faculty, trustees, academic administrators directly related to the teaching-research function, and general administrators. 460 usable responses were received. The questionnaire requested rating of the college president on a Likert scale ranging from 1 for "very ineffective" to 5 for "highly effective." The average of the reported ratings was 3.79. The highest ratings received by the presidents came from general administrators, the next highest from the trustees, followed by those from the faculty and the academic administrators. The faculty rating of 3.74 differed significantly ( $p < .05$ ) from the ratings of 3.99 by the general administrators. The problem of a college president is to balance the time and effort spent in seeking support for the college against that spent in administering its academic affairs.—*A. J. Ter Keurst.*

10393. Giffard, Jacques. **[Practical classes or how to solve a key problem.]** (Fren) *Orientation Scolaire et Professionnelle*, 1974(Apr-Jun), Vol 3(2), 135-154.—Presents a critical review of the reform measures adopted in the French public school system, specifically the reorganization of the "practical classes" that emphasize training of applied skills. The poor results of this major effort to solve the problem of a general education for the moderately gifted are analyzed.—*M. G. Strobel.*

10394. Hall, Keith A. (Pennsylvania State U) **Inservice mathematics education for elementary school teachers via computer assisted instruction.** *Educational Technology*, 1974(Apr), Vol 14(4), 59-61.—Describes a project to test a teacher training program using computer assisted instruction. The program uses a mobile laboratory to provide inservice education to teachers in Appalachia. Of 444 students who started the course, 387 completed it, and their mean performance on an achievement test increased from 53% pretest to 73% posttest.—*C. B. Kreitzberg.*

10395. Herbert, G. W. (U Newcastle-upon-Tyne, England) **Teachers' ratings of classroom behaviour: Factorial structure.** *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 233-240.—Proposes that a 5-factor structure in ratings by teachers is useful and theoretically justifiable, comprising stable and unstable aspects of extraversion-introversion, and a dimension of Competence or the Good Pupil. The construction of a scale to test this structure is described. The scale was administered to 141 10-11 yr old males. The resultant factor analysis supports the 5-factor structure at the 1st-

order level; at the 2nd-order level there is a parallel with broad dimensions identified by other workers. (25 ref)  
—*Journal abstract.*

10396. Jackson, Gregg & Cosca, Cecilia. (US Commission on Civil Rights, Washington, DC) **The inequality of educational opportunity in the Southwest: An observational study of ethnically mixed classrooms.** *American Educational Research Journal*, 1974(Sum), Vol 11(3), 219-229.—Assessed teacher behavior as a factor in the quality of educational opportunity afforded students of different ethnic groups. Os visited 494 classrooms, using a modified Flanders interaction coding system to code teacher verbal behaviors with reference to the ethnicity of the student to whom each behavior was directed. Results indicate a number of statistically significant, substantial, and pedagogically important disparities in teacher behavior toward Mexican-American and Anglo-American students. 22 teacher, student, classroom, and school characteristics were also investigated for their possible association with these disparities; a few significant relationships were found.—*Journal abstract.*

10397. Kessler, Christine; Korn, Hildegard; Precht, Ursula & Vogel, Angelika. (U Munich, Inst of Psychology, W Germany) [Teachers' attitudes toward school psychologists.] (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(2), 103-112.—Obtained the opinions of a representative sample of 100 teachers in Munich schools of 4 different levels regarding 40 statements about school psychologists. Factor analysis identified 7 factors which accounted for 51.3% of the variance. 91% of the respondents stated that they would actively promote the creation of positions for school psychologists, 69% without any reservations. 81% wanted such a psychologist to have teacher training also, and 79% thought that he should teach besides having other duties. Extensive psychological knowledge was valued by practically all the teachers questioned. (English summary)—*W. O. Horn.*

10398. Legrand, Louis. [School attendance of the 11-16 age group: Essay concerning general problems.] (Fren) *Orientation Scolaire et Professionnelle*, 1974(Apr-Jun), Vol 3(2), 87-104.—Evaluates the organization and rationale of the French secondary school system in the light of the aspirations and goals of present French society. The discussion endeavors to define basic problems of any educational system and stresses psychological factors to be taken into consideration when implementing structural changes.

10399. Leviton, Harvey. (Edina Public Schools, MN) **Promoting professional growth for the school psychologist.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 260-262.—Lists 33 behavioral objectives that could be used to guide the professional development of school psychologists. They are related to the areas of instruction, assessment, community relations, and professional growth.

10400. Lewis, Carol R. (Rahway Junior High School, NJ) **School psychologist as program consultant.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 294-295.—Describes the role of psychological services in a junior high school, the type of help they provided, and specific outcomes obtained through these services.

10401. Lintner, Alfred C. & DuCette, Joseph. (Stratford Public Schools, NJ) **The effects of locus of control, academic failure and task dimensions on a student's responsiveness to praise.** *American Educational Research Journal*, 1974(Sum), Vol 11(3), 231-239.—Investigated the responsiveness to praise of 285 elementary school pupils as a function of task variables and S characteristics. The individual difference variables of locus of control and previous school-related failure were utilized. Analyses of the effects of praise differed considerably between an ambiguous coding and an academic reading task. Male Ss with an external locus of control orientation were responsive to praise on the coding task. Female Ss were generally not responsive, regardless of individual characteristics. Reading test residual gains, however, were affected by prior experiences of failure and praise. Results are interpreted as demonstrating the importance of integrating task variables into aptitude-treatment interaction research.—*Journal abstract.*

10402. Masendorf, Friedrich; Tücke, Manfred & Bartram, Mathias. [Accuracy of teachers' estimates of their teaching as judged by their students.] (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(2), 89-93.—25 statements indicating strictness and authoritarianism and 23 items measuring a democratic, helping attitude on the part of their teachers were answered anonymously by 15 elementary school classes, 15 classes for special students, and 10 junior high school classes in Grades 7-9. The 40 teachers of these classes had to estimate their students' answers on each item. Teacher and student scores on strictness correlated .63, on helping only .41. The need to increase feedback and to evaluate the effectiveness of a democratic teaching style is discussed. (English summary)—*W. O. Horn.*

10403. McNamara, J. Regis & Diehl, Luther A. (Ohio U) **Behavioral consultation with a Head Start program.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 352-357.—The effects of a behaviorally oriented psychological consultation program for teachers were evaluated by 3 methods in a system of 10 Head Start centers. Each center had 20 children; teachers were 10 white females with an average age of 40.5 and an average IQ of 108. The centers were divided into 3 groupings, each having the same program but different conditions for goal setting, type of feedback received, and degree of structure for carrying out program assignments. Program effectiveness was analyzed on the basis of recording performance, final workshop examination scores, and teacher ratings of the program. Results show that the type of feedback received and the way program assignments were structured differentially affected program performance. (19 ref)—*Journal summary.*

10404. Merwin, William C. (U North Florida) **A systems approach for teacher training.** *Educational Technology*, 1974(Apr), Vol 14(4), 57-59.—Describes the philosophy underlying the development of a series of self-instructional modules for the competency-based education of social studies teachers.

10405. Miller, P. McC. & Dale, R. R. (MRC Epidemiology Unit, Royal Edinburgh Hosp, Scotland) **A comparison of the degree results of university students from co-educational and single-sex schools.** *British*

*Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 307-308.—Compared the university degree results from 221 matched pairs of students from co-educational and single-sex schools. Results were similar except that more 1st-yr dropouts occurred among the single-sex educated students.

10406. Ozer, Mark N. & Dworkin, Nancy E. (George Washington U, Medical School, Program for Learning Studies) **The assessment of children with learning problems: An in-service teacher training program.** *Journal of Learning Disabilities*, 1974(Nov), Vol 7(9), 539-544.—Describes a model clinical program designed to help children with learning problems remain in the regular classroom and to enhance the competence of the teacher to deal with the variety of needs within the classroom. In a demonstration, the teacher observes those children whom she has first identified as having difficulties and then described on a teacher report form (TRF). The examiner utilizes specific strategies in interaction with the child to solve the child's problem in accomplishing a given task. The teacher sees how the child may be assisted in learning how to cope with difficulties. She may recognize the strategies demonstrated as being within her own repertoire and as those she was exposed to in the TRF. The consultant aids the teacher in applying the strategies in the context of what she would like to see the child accomplish, thereby making the teacher more aware of her own competence in helping the child. The consultant also helps the teacher to generalize the strategies she uses with a specific child to her interactions with other children within the classroom. The clinical program thus works as an in-service teacher training program, with communication of a limited but expanding number of problem-solving strategies that may be applied to a multitude of educational tasks.—*Journal abstract.*

10407. Pascarella, Ernest T. (Syracuse U) **Student-institutional congruence: A student perspective.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 78-87.—Compared the views of A. W. Astin and G. G. Stern regarding institutional pressures vs student characteristics. Astin held that student characteristics create the climate of a college, while Stern said that students account for about 35% of the college environment. 145 freshman and 121 senior students responded to 26 bipolar adjective pairs. Varimax rotation identified 4 factors: Intellectual-Creative Dynamism, Impulsive Idealism, Competition, and Openness. Significant concept effects were found in the freshmen analyses on dynamism and idealism, and in the seniors on all factors. The students perceived substantial dissonance between the characteristics of their peers and of institutional environment. On dynamism for the seniors and freshmen and on competition for the seniors, student perceptions of the college environment were more closely related to faculty attitudes toward them than to peer attitudes. Findings largely support Stern's viewpoint. (23 ref)—A. J. Ter Keurst.

10408. Rosenfeld, Joseph G. & Blanco, Ralph F. (Temple U) **Incompetence in school psychology: The case of "Dr. Gestalt."** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 263-269.—Presents the case study of an incompetent school psychologist, and demonstrates

how the areas of incompetency can be identified and what can be done to have the psychologist dismissed.

10409. Shane, Don G. & Van Osdel, William R. (Central State U, Edmond, OK) **Practicum: As a part of special education training programs.** *Education & Training of the Mentally Retarded*, 1974(Apr), Vol 9(2), 74-77.—Discusses the purposes and implications of college student practicum experiences. The inclusion of practicum experience as an integral part of special education training programs is seen as essential, the most effective means available to provide a practical orientation in teacher training. A major advantage of practicum is seen in the flexibility it offers by assigning students to different types of exceptional children. Students, in this way, can have meaningful experiences in gaining firsthand knowledge of the wide variances in personality and learning characteristics of exceptional children. The program requirements and services provided by a state university training program in special education are outlined. It is concluded that, as knowledge of practicum increases, and as more community services are initiated, training programs will continue to improve.—P. O'Brien.

10410. Swassing, R. H. (Ohio State U, Faculty for Exceptional Children) **Parameters of classroom environment for beginning teachers.** *Education & Training of the Mentally Retarded*, 1974 (Apr), Vol 9(2), 89-93. Alerts the beginning teacher to the various parameters that can be controlled to establish the best environment for both children and teacher. 6 parameters are explored: physical properties, student placement, task presentation, time, performance rates, and motivational system. It is suggested that the environment must be a dynamic, changing setting, and that in a classroom where the teacher can quickly ascertain the impact of an environmental change upon performance, success rates of the children will reach criterion.—P. O'Brien.

10411. Thomson, Carolyn; Holmberg, Margaret & Baer, Donald M. (U Kansas) **A brief report on a comparison of time-sampling procedures.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 623-626.—Used the teacher training model to quantitatively compare the accuracy of continuous and intermittent time-sampling procedures. Contiguous, alternating, and sequential methods for assigning a limited number of Os to a larger number of teachers and/or children were tested. Repeated daily observations were made of 2 different behaviors (rate of reinforcing S's social interactions with peers and rate of priming social interaction with peers—prompting the child to play with other children) of 3 different teachers. Each teacher was observed for at least 64 min, using the standard 10-sec ongoing time-sampling technique. The sequential method (i.e., that which assumes that the most widely dispersed pattern of sampling would be most representative and would systematically use each time segment to sample whichever S had been sampled longest ago) was associated with the smallest percentage of error, apparently because it was the most widely dispersed sample of the entire observation period. The contiguous (i.e., sampling during the longest possible unbroken time period) and the alternating (i.e., sampling intermittently for half the time available) showed similar amounts of error.—L. Gorsey.

10412. Tomlinson, Jerry R. (Minneapolis Board of Education, Psychological Services, MN) **Functional analysis and accountability of psychological services.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 291-294. —Describes how functional analysis was used to evaluate the psychological services program of a large metropolitan school system. 44% of the services were performed in the kindergarten through the 3rd grade, and individual evaluation was the most frequently performed service. The psychologist met with teachers in 75% of the cases. One-third of the referrals were of children previously seen for psychological services.—H. Kaczowski.

10413. Twardosz, Sandra; Cataldo, Michael F. & Risley, Todd R. (U Kansas) **Open environment design for infant and toddler day care.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 529-546.—In a series of 6 studies in an infant and a toddler day-care center, an open environment was examined as a means to increase the visibility of children to staff and of staff-child interactions to the supervisor, and to investigate potential adverse effects of the open environment on infants' and toddlers' activities. Results show that (a) an open environment markedly decreased the amount of time a child could not be seen by any adult and the amount of time staff members' activities were not visible to the supervisor, and markedly reduced the effort required to supervise those who were not immediately visible; (b) an open environment did not adversely affect the sleep of either infants or toddlers; and (c) an open environment was as conducive to small group preacademic activities with toddlers as was a separate room. It is concluded that infant and toddler day care can and should be accomplished in an open environment. (16 ref) —*Journal abstract.*

10414. von Engelhardt, Georg & Lück, Helmut E. (Rhineland Coll of Education, Div of Special Education, Cologne, W Germany) **[Teacher's job satisfaction in schools of different levels.]** (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(2), 113-117.—A 36-item job satisfaction scale and 20 items to measure the perceived leadership style of their principals were answered by 155 teachers in 21 Cologne schools. 79% thought their work interesting and satisfying, but 56% thought their classes were too large, 35% were dissatisfied with discipline, and 34% complained about too many administrative tasks. The 88 females did not differ in overall job satisfaction from their male colleagues. Those descended from or married to teachers were more often satisfied. High school teachers (Gymnasium) were significantly less satisfied than those from elementary schools. Satisfaction decreased as the size of school and size of class increased, and as principals were less considerate of teaching staff. (English summary) (15 ref) —W. O. Horn.

10415. Wetterström, Magnhild. **[Student influence in some organizationally different environments in grades 7-8 in the comprehensive school.]** (Swed) *Pedagogisk-Psychologiska Problem*, 1974(Oct), No 250, 55 p.—Examined the influence exerted by 7th and 8th graders in 3 different environments (from traditionally built schools to open-plan schools, with increasing degrees of flexibility in organization). Questionnaires were administered to

students and their teachers over a 2-yr period. Results show no systematic differences between the schools, despite different means of organization and working methods used by the teachers. (18 ref)—*English abstract.*

### Curriculum Development & Teaching Methods

10416. Arnaud, Elie E. (Character Education Project, San Antonio, TX) **Can the schools affect character education?** *Texas Personnel & Guidance Association Journal*, 1973(Mar), Vol 2(1), 39-42.—Summarizes the Character Education Project (CEP) of San Antonio, Texas. The full-year programs for kindergarten through 6th grade have been tested in Indiana, Minnesota, California, Texas, and Colombia, South America. They are intended for counselors, teachers, and parents. Children are taught a technique of thinking which leads to behavior consonant with American values and the pursuit of the good life. All preliminary evidence as to the effectiveness of CEP is favorable.—H. Crouch.

10417. Betson, C. Daniel. (Kansas U) **Creative religious growth and pre-formal religious education.** *Religious Education*, 1974(May), Vol 69(3), 302-315.—Discusses theories of religious development and their application to early religious education. 4 aspects seem important: (a) that the child learn, through participation in activities of the community of faith, that he is a loved and accepted member; (b) that he be encouraged to interpret significant experiences in his life through symbolic thought and expression; (c) that he be helped to deal with conflicts arising from his interactions with others; and (d) that this education take place in a responsive environment. The religious educator's task in working with children before preadolescence is to foster their growth in these ways, rather than to pass on a particular religious tradition.—E. A. Gavin.

10418. Brown, David; Reschly, Daniel & Sabers, Darrell. (U Arizona) **Using group contingencies with punishment and positive reinforcement to modify aggressive behaviors in a Head Start classroom.** *Psychological Record*, 1974(Fal), Vol 24(4), 491-496.—Attempted to modify and decrease aggressive behaviors exhibited in a Head Start classroom. Ss were 20 4-yr-old children. Treatment procedures designed to reduce classroom acts of aggression permitted analysis of whether group contingencies enhanced the effects of extrinsic reinforcement and punishment. Findings show that (a) the modification procedures used led to a significant decline in the incidence of aggressive behaviors, and (b) grouping children who are striving for rewards contingent upon prosocial behavior was a useful addition to other behavior modification techniques. (15 ref)—*Journal abstract.*

10419. Carlson, John G. & Minke, Karl A. (U Hawaii) **The effects of student tutors on learning by unit mastery instructional methods.** *Psychological Record*, 1974(Fal), Vol 24(4), 533-543.—In a section of an introductory psychology course employing unit-mastery learning procedures, small groups of students were assigned to individual tutors for testing and tutoring. In 2 other sections unassigned groups of tutors were made available to students. A total of 143 undergraduates served as Ss. Relative to the latter sections, the individually tutored students performed at a higher level

on the unit quizzes, earned higher course grades, and expressed more favorable attitudes toward their tutors. Results are interpreted in terms of interactions between the reinforcing value of the tutors and the types of student-tutor relationships which evolved in the testing situation.—*Journal abstract.*

10420. Cheong, George S. (Mt Saint Vincent U, Halifax, Nova Scotia, Canada) **Changes in student teachers' beliefs and classroom behavior.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 30-35.—Measured changes in the beliefs of student teachers about experimentalism and in the patterns of their teaching behavior, using the Experimentalism Scale (ES) and the Teacher Practices Observation Record (TPOR), both developed by B. B. Brown (1968). The 1st hypothesis was that students are more experimental in their attitudes, beliefs, and values at the end of 1 yr of teacher education than at the beginning. The 2nd hypothesis predicted the same change in classroom teaching practices during the year's program. Most of the 23 undergraduate Ss were majors in the liberal arts. Changes in pre- and posttest performance were significantly in favor of experimentalism both on the ES, representing attitudes ( $p < .01$ ) and on the TPOR, representing teaching practices ( $p < .05$ ). (18 ref)—A. J. Ter Keurst.

10421. Connes, Bernard. (U Sherbrooke, Quebec, Canada) **Course-component evaluation: II. A dynamic computer system for item banking.** *Journal of Structural Learning*, 1973, Vol 4(1), 33-40.—Describes a system of computerized data storage of information gathered during evaluation of components of educational courses. Identified items are filed, and results of testing are coded using a mathematical model. The system of programs includes provisions for updating and use of a flexible language that facilitates keypunching.

10422. Dearth, Paul B. (U New Mexico) **Viable sex education in the schools: Expectations of students, parents, and experts.** *Journal of School Health*, 1974(Apr), Vol 44(4), 190-193.—153 college students, 77 of their parents, and 68 experts responded to a mailed questionnaire concerning their expectations of a sex education program in the schools. Results indicate strong agreement on the issue of providing sex education in the schools: students and experts were unanimously in favor, while only 5% of the parents were opposed. Students favored the separate course approach (63%) with parents concurring (55%) and experts not far behind (40%). There was mixed support among the groups concerning the marital status of the sex education teacher and of the professional affiliation of this teacher: doctor or nurse. In general, where disagreement occurred among the 3 groups, the parent group was usually in opposition to the other 2. It is suggested that these results can be helpful in implementing quality sex education courses.—R. S. Albin.

10423. Deltz, Samuel M. & Repp, Alan C. (Georgia State U) **Differentially reinforcing low rates of misbehavior with normal elementary school children.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 622.—Used a modified differential reinforcement of low rates (DRL) procedure with 3 students in normal classrooms to eliminate talking out and out-of-seat behaviors. Data add single-S replication with normal

children to the literature on the effectiveness of modified DRL techniques.

10424. Egeland, Byron & Winer, Ken. (U Minnesota, School Psychology Training Program) **Teaching children to discriminate letters of the alphabet through errorless discrimination training.** *Journal of Reading Behavior*, 1974(Jul), Vol 6(2), 143-150.—64 inner-city preschool children were taught to discriminate letters of the alphabet using either an errorless discrimination training (EDT) approach or the traditional reinforcement-extinction approach. For the EDT group the distinctive feature of the letter to be discriminated was highlighted in red and as the training proceeded the red was gradually faded. Each group received 10 training trials for each of 2 letter combinations presented in a match-to-sample format. Results show that the EDT group made significantly fewer errors during training and on the posttest than the reinforcement-extinction group.—*Journal abstract.*

10425. Faraponova, E. A. & Kotovskii, A. I. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[The possibility of introducing elements of problem-solving in elementary school model-construction classes.]** (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 105-116.—Reports classroom teaching of general principles of technical problem-solving using the method of model building. Tests of transfer from models of machinery to related problems (spacecraft design) showed more adequate solutions in experimental than in control students. (English summary)

10426. Flammer, August. (U Wisconsin, Madison) **[Individualized instruction in project PLAN.]** (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(2), 136-141.—Explains project PLAN (Program for Learning in Accordance with Needs) which utilizes computer terminals in different schools to individualize sequences of learning according to abilities and different needs. In 1971 the project involved 15,000 students in California, Pennsylvania, and New York. (English summary)

10427. Gardner, David C. (Boston U) **Halo effects in employer ratings of career education students and coordinators.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 363-366.—Discusses problems in evaluating the effectiveness of work and work-related programs used in career education, showing how the "halo effect" determines if a program is termed successful or unsuccessful.

10428. Gordon, Sol. (Syracuse U) **What place does sex education have in the schools?** *Journal of School Health*, 1974(Apr), Vol 44(4), 186-189.—Discusses the alternatives schools have in helping children to become more knowledgeable about their own sexuality. It is asserted that psychological counseling is not the domain of the educational system and that this must be provided by parents. Another limitation of the schools' role in this learning is the student's general mistrust and suspicion of the system. Individual differences in the need for sex education exist among schools and should be assessed within each system. It is suggested that the greatest potential for sex education lies in psychology and in human relations courses. In this sense, a consideration of the issue of what is normal would teach students about the great range of human behavior that is healthy. Topics

considered to be important in any sex education course include information about masturbation, penis size, perversions, homosexual thoughts and experiences, and emotional commitment and sex. Parenting is a topic rarely discussed but of great importance to a healthy conception of sex. Suggestions are made for implementing such a program. (35 ref)—*R. S. Albin.*

10429. **Graubard, Paul & Rosenberg, Harry.** (Yeshiva U) **Classrooms that work: Prescriptions for change.** New York, NY: E. P. Dutton, 1974. x, 214 p. \$7.95.

—Argues for the use of behavior modification techniques as teaching tools to be used by and for entire student populations, both "deviant" and normal. Various successful programs based on these principles, including student team teaching, peer tutoring, cross-age tutoring, individualized learning, contracts, and token economy systems, are surveyed, and specific case illustrations are presented. (4 p ref)

10430. **Hahn, Joyce & Dunston, Virginia.** (La Escuela Cuauhtemoc, Redwood City, CA) **Bilingualism and individualized parent education: An organic approach to early childhood education.** *California Journal of Educational Research*, 1974(Nov), Vol 25(5), 253-260.—Describes an education program designed to use as many aspects of the child's world as possible and which includes both bilingualism and individualized parent education in its preschool program. Results show significant gains from pre- to posttest administrations of the Caldwell Preschool Inventory. The children of parents who participated most achieved higher scores at the end of the year.

10431. **Harris, Mary B. & Liguori, Ralph A.** (U New Mexico) **Some effects of a personalized system of instruction in teaching college mathematics.** *Journal of Educational Research*, 1974(Oct), Vol 68(2), 62-66.—Investigated the effect of using a Personalized System of Instruction (PSI) approach to teach college mathematics; the role of a final examination, and the use of students as tutors in such procedures. 80 undergraduates were assigned to a mastery approach which used students as proctors, to a mastery approach without students as proctors, or to a lecture control group. Within each group Ss were randomly assigned to have their final examination score count or not count towards their grade in the course. Scores on the final were not significantly different for those in the 3 treatment groups. Ss for whom the final counted had significantly higher scores on that test and reported studying more than did their controls. No advantages to serving as a proctor were found in those who dropped out, but those in the PSI groups who completed the course had lower pretest scores than those in the control group who finished the course. (17 ref)—*Journal abstract.*

10432. **Harris, V. William & Sherman, James A.** (Southwest Indian Youth Ctr, Tucson, AZ) **Homework assignments, consequences, and classroom performance in social studies and mathematics.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 505-519.—In 2 experiments with a total of 77 6th graders, Ss who frequently answered questions incorrectly in class were given daily homework assignments in social studies and mathematics, but they rarely completed the assignments

accurately, and their classroom performance in social studies and math was only slightly better than when they did not have homework assignments. However, consequences provided for accurate completion of homework assignments increased the number of students completing homework and the accuracy with which homework assignments were completed. Further, assignments of homework with consequences for accuracy were associated with more accurate classroom performance. (26 ref)—*Journal abstract.*

10433. **Hartnett, Rodney T.** (Educational Testing Service, Princeton, NJ) **Adult learners and new faculty roles.** *Findings*, 1974, Vol 1(3), 1-4.—Evaluated innovative teaching programs at three American universities which utilized the teaching methods and materials of the British Open University System. The system had no formal classes, an emphasis on self-motivation and study at home, a rigid schedule of assignments, plus heavy use of textbooks, television, and correspondence materials including study guides and quizzes. Study centers were provided where students could go, on a voluntary basis, for tutoring, counseling, review of television programs, etc. Questionnaires were administered to 247 students who completed a humanities course in this way. Results show that contact with other students and with tutors was very relevant to their satisfaction with the course. 38 faculty members involved with the program were also queried. Since their participation 71% reported an increase in interest in working with students, 79% reported an increase in desire to develop new course materials, and 76% said they had become more interested in developing nontraditional teaching modes. Recommendations are made for development of new open university programs.—*R. S. Albin.*

10434. **Hosie, Thomas W.; Gentile, J. Ronald & Carroll, Jill D.** (Northeast Louisiana U, Monroe) **Pupil preferences and the Premack principle.** *American Educational Research Journal*, 1974(Sum), Vol 11(3), 241-247.—Studied the application of the Premack Principle using human Ss. In Exp 1, 14 Ss were randomly selected from a class of 28 6th graders in Buffalo, New York, who were classified by an O as preferring painting or modeling clay. The amount of time Ss spent on a reading task was also recorded and they were then randomly assigned to receive painting or modeling based upon successful completion of a report-writing task. Exp II was similar but utilized 40 Ss from 4 classes (2 5th- and 2 6th-grade) and preferences were determined using 2 Os instead of one. The dependent variable was the amount of time taken to complete the assignment. According to the Premack Principle, the time taken to complete the task would be less for those who were promised that they would be able to engage in the activity they preferred when they had completed the task. Both experiments supported this hypothesis. It is concluded that where a clear preference existed, the Premack Principle might be usefully applied in class.—*E. J. Mason.*

10435. **Jacquemin, J.-M.** (U Louvain, Belgium) **[Genetic psychology and modern mathematics in the primary school.]** (Fren) *Revue de Psychologie et des Sciences de l'Education*, 1973, Vol 8(4), 503-509.—Argues that, from the point of view of the psychogenesis of cognitive structures in 5-8 yr old children, attempts to

teach modern mathematics from the beginning of the elementary school cycle have created important problems. A few of these problems are discussed, with the emphasis on the need for a strict and continuous adaptation of the sequences of mathematical apprenticeship to the recognized objective characteristics of cognitive development. (French, Flemish, & English summaries)—*Journal summary*.

10436. Joiner, Elizabeth G. (U South Carolina) **Evaluating the cultural content of foreign-language texts.** *Modern Language Journal*, 1974(Sep-Oct), Vol 58(5-6), 242-244.—Presents a questionnaire to help assess stereotyping and negative attitudes toward a foreign culture incorporated in a foreign-language textbook.

10437. Kharlov, G. A. (Dnepropetrovsk U, USSR) [The possibility of memorizing increased lexical dosages in learning a foreign language.] (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 85-93.—Tested the ability of foreign language students to learn more words during a class session than has been accepted as the norm. 48 students in 2 colleges served as Ss. A letter cancellation task was given at the beginning and end of each training session as a measure of fatigue. Ss learned the meaning of 10, 20, 30, 48, or 60 words using the paired associates method, contextual recognition, translation, and other exercises. Humanities majors and others with some language background could learn 48 and 60 words in a session without significant fatigue. Students in an agriculture college course with no foreign language prerequisite could learn as many as 30 or 35 words. Higher dosages, however, led to a statistically significant decrement in work capacity. (English summary)—*L. Zusne*.

10438. Klasson, Alger. [Principals in the compulsory school: Description of tasks by means of data from interviews.] (Swed) *Pedagogisk-Psykologiska Problem*, 1974(Jul), No 245, 169 p.—Presents an analysis of the tasks of principals in the compulsory school, based on interviews with 62 principals and 8 teachers. To get a picture of future principal tasks and the changing tendencies in the job, 26 interviews were carried out with high officials and central organizations. By means of content analysis the interviews were classified into the categories of Content, Contact, and Ability.—*English summary*.

10439. Knight, John J. (Indiana U) **Instructional dysfunction and the temporary contract.** *Educational Technology*, 1974(Apr), Vol 14(4), 43-44.—Proposes temporary instructional "contracts" between teacher and student as a means of improving the quality of communication in the classroom.

10440. Knowles, Lyle. (Pepperdine U) **Helping students learn basic inferential statistics.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 7-11.—Presents several techniques by which undergraduate and graduate college students can improve their learning of statistical concepts and operations. 2 unusual devices are described: providing the students with the instructor's teaching notes and returning students' examination papers to them for correction. The latter device increases academic achievement because student anxiety is reduced and

because they do not compete with other students but with their own previous performance.—*A. J. Ter Keurst*.

10441. Koffman, Elliot B. (U Connecticut) **CAI systems that process natural language.** *Educational Technology*, 1974(Apr), Vol 14(4), 37-42.—Surveys a number of generative systems of computer assisted instruction which have the ability to construct tutorial sequences and respond to student queries by manipulating a data base of relevant information. The systems are oriented toward the humanities and textual manipulation. The use of artificial intelligence research as a theoretical foundation for the natural language processing aspects of these systems is discussed.—*C. B. Kreitzberg*.

10442. Kroll, Herman M. (U Wisconsin Ctr System, Madison) **The relative effectiveness of written and individualized audio instruction in the intermediate grades.** *AV Communication Review*, 1974(Fal), Vol 22(3), 247-268.—Using cassette tapes or printed booklets, 120 children, mostly 5th-graders, studied the scientific method. Children read or listened individually and could reread or replay the material as they wished. Posttests showed that high-ability students did equally well by listening or reading, and low-ability students did not do as well, regardless of mode.—*Journal summary*.

10443. Lesiak, Walter J. & Walt, Judith A. (Central Michigan U) **The diagnostic kindergarten: Initial step in the identification and programming of children with learning problems.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 282-290.—Describes how a traditional kindergarten can be transformed into a diagnostically and developmentally oriented program. Topics discussed include assessment strategies, inservice training goals, classroom interventions, implications for the primary grades, and the function of the school psychologist. Field test results of the model are reviewed.—*H. Kaczowski*.

10444. Long, Barbara E. (Dept of Health & Welfare, San Mateo, CA) **Educational change with elementary school psychology curriculum.** *Professional Psychology*, 1974(May), Vol 5(2), 166-174.—Discusses implications of making psychology an essential part of precollege education. It is contended that the assimilation by children of psychology presented in a way fitted to their interests and their developmental level contributes to their mental health, increasing their self-understanding, coping strength, and empathy with others. Research possibilities deriving from evaluation studies of psychology curricula are suggested, and changes in teacher role and philosophy entailed by the incorporation of psychology experiments into the classroom procedure are considered. (33 ref)—*B. Lindsey*.

10445. Lovinger, Sophie L. (Central Michigan U) **Socio-dramatic play and language development in preschool disadvantaged children.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 313-320.—Studied the relationship between language development and creative play in 18 disadvantaged children enrolled in a preschool nursery program. It is concluded that play helps children organize information into meaningful concepts.

10446. Matlick, Richard. (Howard Community Coll, Columbia, MD) **A learning laboratory for the small community college.** *Audiovisual Instruction*, 1974(Sep), Vol 19(7), 30-32.—Describes the development of a

laboratory for mediating independent learning at a community college. Ways in which the usually prohibitive cost of the laboratory was controlled are discussed.

10447. McCoy, David. (Eastfield Coll) **Continuous evaluation of instructional media services at Eastfield College.** *Audiovisual Instruction*, 1974(Sep), Vol 19(7), 10-13.—Describes how the staff of a college "learning resource center," in order to maintain a high standard of service, developed and implemented a simple yet effective system for ongoing evaluation of instructional media services.

10448. McFadden, John. (California State U, Sacramento) **A bi-cultural approach to ESL for adults: A Paulo Freire model of the basic learning group.** *California Journal of Educational Research*, 1974(Nov), Vol 25(5), 289-293.—Presents a theoretical study of experiences and needs in bicultural adult education in English as a second language (ESL) using P. Freire's (1970) 5-point model of learning groups. Suggestions for ESL teachers and for empirical research on curriculum content, democratic class organizations, codification of home-school experiences, and problem-solving activities are presented.

10449. McNinch, George. (U Southern Mississippi, Reading Ctr) **Reading sight words in different letter styles.** *Southern Journal of Educational Research*, 1974(Sum), Vol 8(3), 332-341.—Studied whether graphic constraints (i.e., the style in which the letters were constructed) would be a factor in sight word reading success. 4 9-item word lists—upper case, primary type, manuscript, and mixed allographs—were constructed and presented tachistoscopically to 40 randomly selected 4th graders. Comparisons were made across all Ss and between good and poor reading groups. No differences were found in any of the 3 comparisons. It is concluded that distorting the featural field of words by presenting them in mixed allographs did not increase the difficulty of their pronounceability.—*Journal abstract.*

10450. Merritt, Ray. (Delta State Coll) **Conventional methods and independent study in teaching educational psychology.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 826.—42 undergraduates learned 2 units of work either by independent study or by the conventional methods of teaching (e.g., lecture and films). Analysis of variance of scores earned on teacher-made tests indicated no significant differences in the groups' performances.

10451. Morin, Stephen F. (California State Coll, San Bernardino) **Educational programs as a means of changing attitudes toward gay people.** *Homosexual Counseling Journal*, 1974(Oct), Vol 1(4), 160-165.—Assessed ways in which a specifically designed course on homosexuality including 7 groups of gay speakers affected attitudes of 18 advanced college students. Semantic differential ratings of 16 concepts were analyzed by means of a *D* statistic in a pre- and posttest design. Ratings of the term "homosexual" were significantly more positive on the posttest as were the ratings of "gay person," "dyke," and "woman." A self-concept measure indicated a significant change in a positive direction as predicted.—*Journal abstract.*

10452. Mullins, Terence Y. **Social desirability as a factor in Christian education.** *Religious Education*, 1974(May), Vol 69(3), 292-301.—Proposes that what a

person sees as socially desirable partially depends upon the kind of education he receives. In Christian education persons may be alerted to see things in life that they would be unable or unlikely to see in the absence of the expectations such education affords. Social desirability can subtly influence action by affecting a person's attitudes and by presenting a different range of options for his responses. Emphasis of Christian education upon individual attitudes is likely to increase their social desirability within the group.—*E. A. Gavin.*

10453. Newton, James E. (U Delaware) **College student knowledge of Afro-American history and culture in relation to black studies.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 42-49.—Measured differences between 50 students in the Black Studies Curriculum Group (BSCG) and 42 students in the Traditional Curriculum Group (TCG). Both groups included white and black students. All Ss were administered the 2-part Afro-American Knowledge Inventory (AAKI); Part 1 measures knowledge of Negro culture by a multiple-choice test, Part 2 measures knowledge of Negro personalities by visual presentations. Ss were also tested by 2 attitude scales: a semantic differential test and a general attitude test. The differences between the 2 curriculum groups both on the AAKI ( $p > .01$ ) and on the 2 attitude scales ( $p > .05$ ) were significant. Scores of the white Ss in the 2 curriculum groups differed significantly ( $p < .01$ ). Differences between the ethnic groups in the BSCG were significant for Part 2 of the AAKI but not for Part 1.—*A. J. Ter Keurst.*

10454. Parkay, Forrest. (U Chicago) **The inner-city high school.** *School Review*, 1974(May), Vol 82(3), 468-485.—Discusses the unique demands of inner-city teaching, based on 4 yrs of experience in teaching English at an all-black high school in Chicago. 4 interacting variables which teachers can control in their classrooms are described: the content and relevance of curriculum, the emotional climate of the group, methodological choices, and awareness of class dynamics. Inner-city students can be classified into 1 of 6 types: conforming, nonconforming, variable, disruptive, withdrawn, and marginal. The teacher's role is to maximize success by adapting approach and content to the particular students involved.—*C. K. Miller.*

10455. Paulson, F. Leon. (Child Development Associate Consortium, Washington, DC) **Teaching cooperation on television: An evaluation of Sesame Street social goals programs.** *AV Communication Review*, 1974(Fal), Vol 22(3), 229-246.—During its 3rd season, the "Sesame Street" program included segments specifically designed to teach children cooperation. The effectiveness of the instruction was examined by testing 36 inner-city preschool children who viewed an entire season of "Sesame Street" at their day care centers, and 42 who did not. Children were observed in situations like those shown on TV and during free play, and were asked to identify pictured examples of cooperation. Viewers scored significantly higher than nonviewers, but there was no evidence of transfer of learning to new situations.—*Journal abstract.*

10456. Peelle, Howard A. (U Massachusetts, Amherst) **Computer glass boxes: Teaching children concepts with "A Programming Language (APL)." Educational Tech-**

nology, 1974(Apr), Vol 14(4), 9-16.—Describes a new computer-based approach to teaching children concepts which differs from traditional systems of computer assisted instruction in that the new approach allows children to exert some control over their own learning processes.

10457. Ponomareva, R. A. (Inst of Psychology, Kiev, Ukrainian SSR) [Methods of constructing an image of a technical object in adolescents.] (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 117-126.—Studied the development in 7th- and 8th-graders of a visualized image of a verbally presented description of a piece of electronic apparatus. 3 methods for developing such an image were identified, corresponding to 3 levels of generalization of the essential characteristics of the object to be represented: Ss drew the diagram element by element, as an integral system, or in a way that reflected a method intermediate between these two. (English summary) (15 ref)—L. Zusne.

10458. Postovsky, Valerian A. (Defense Language Inst, West Coast Branch, U California, Berkeley) Effects of delay in oral practice at the beginning of second language learning. *Modern Language Journal*, 1974(Sep-Oct), Vol 58(5-6), 229-239.—Studied the effects of graphic instead of oral response on performance in beginners' Russian. In Exp I, 62 young military language-training volunteers were matched in pairs and divided into an experimental (E) and a control (C) group. Exp II was an exact replication of Exp I, using 30 matched pairs. For the 1st 4 wks of instruction, Group E responded to Russian utterances in Russian script, while Group C responded orally. Thereafter both groups received equal treatment. After 6 wks, Group E's general performance was superior ( $p < .01$ ), particularly in speaking ( $p > .0001$ ). After 12 wks, confidence interval analysis indicated superior listening comprehension in Group E ( $p < .008$ ). Results are attributed to (a) increased storage time of Russian utterances required when responses are written, (b) E group's nonexposure to imperfect Russian, and (c) visual reinforcement.—C. A. Sherrard.

10459. Powell, J. P. (U Papua & New Guinea, Port Moresby) Small group teaching methods in higher education. *Educational Research*, 1974(Jun), Vol 16(3), 163-171.—Coded tape recordings of 13 undergraduate tutorial meetings to determine amount of speech contributed by each member and the cognitive content of the verbal interaction. Participation rate of tutors was 27.8-74% with a mean participation score of 58%. Student participation scores increased significantly when tutor was absent. Content of discussions in tutor-led groups emphasized information while leaderless groups stressed argument. Both tutors and students reacted favorably to the leaderless groups, with 84% of the students feeling that they learned more when the tutor was absent. Results suggest that both teacher-led and leaderless tutorial groups can provide significant educational benefits for students.—J. B. Francis.

10460. Rieth, Herbert et al. (U Kansas) Influences of distributed practice and daily testing on weekly spelling tests. *Journal of Educational Research*, 1974(Oct), Vol 68(2), 73-77.—Compared different means of presenting spelling words to students. A total of 8 4th graders, 58

5th graders, and 1 7th grader took part in 4 experiments. The dependent variable for all studies was the Ss' scores on weekly review tests. Exps I, II, and III demonstrated that Ss did better on the weekly review tests when they received a portion of the words each day and were tested daily than when they received all words at the beginning of the week and did not have daily tests. Exp IV indicated that receiving a portion of the words each day without daily testing was inferior to receiving a portion of the words each day with daily testing, but better than receiving all words at the beginning of the week without daily testing.—Journal abstract.

10461. Rushman, John R. Educational consciousness. *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 76-77.—Argues that a liberal education, if it is to meet the needs of a modern free society, should re-emphasize growth in personal creativity and a sense of individuality on the part of the student. The emphasis of current liberal education on the priority of group practices stifles individuality.

10462. Schoen, Harold L. (Virginia Polytechnic Inst & State U) CAI development and good educational practice. *Educational Technology*, 1974(Apr), Vol 14(4), 54-56.—Learning theories and theories of instruction have established that certain practices are essential to efficient education. A number of examples of "good educational practice" derived from various theories are cited. It is argued that to be effective computer assisted instruction must incorporate good educational practice.—C. B. Kreitzberg.

10463. Stanton, H. E. (Flinders U South Australia, Bedford Park) The relationship between teachers' anxiety level and the test anxiety level of their students. *Psychology in the Schools*, 1974(Jul), Vol 11(3), 360-363.—Studied the effect that the type of classroom (open vs closed) and the level of teacher anxiety has on the level of student anxiety. Ss were 1,047 Australian children and 32 6th- and 7th-grade teachers. The Trait Anxiety Scale of the State Trait Anxiety Inventory and the Test Anxiety Scale for Children were used to assess levels of anxiety. Results indicate that anxious teachers did not necessarily produce anxious students.

10464. Strain, Phillip S. & Timm, Matthew A. (American U) An experimental analysis of social interaction between a behaviorally disordered preschool child and her classroom peers. *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 583-590.—Measured the social interaction between a behaviorally disordered preschool child and her classroom peers under 2 conditions of contingent adult attention: verbal praise and physical contact directed to the target S's peers for appropriate interaction with the target S, and verbal praise and physical contact directed specifically to the target S for engaging in appropriate interaction with peers. Continuous measures of interactive behavior were made during baseline, intervention, and return to baseline conditions. Results indicate that application of experimental contingencies to peers (Condition 1) rapidly increased appropriate social behaviors by the peers and also by the target S. When experimental contingencies were applied to the target S (Condition 2), a similar increase in appropriate social behaviors was noted for both the target S and the peers. Additionally,

during Conditions 1 and 2 the recipient(s) of contingent adult attention initiated more appropriate social contacts than did the interacting partner(s).—*Journal abstract.*

10465. **Sturgis, Daniel K.; Iacono, C. U. & Kuncze, Joseph T.** (U Missouri) **Parental advantagement, IQ, and differential responsiveness to an education enrichment program.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 329-333.—Reports on the effectiveness of a large experimental program to provide assistance to students according to their diagnosed needs. Ss were 878 1st-grade students. It is concluded that the program helped to reduce the gap in achievement between the less capable students and their peers.

10466. **Thiagarajan, Sivasailam.** (Indiana U, Ctr for Innovation in Teaching the Handicapped) **Indicator hunt: A goal analysis game.** *Educational Technology*, 1974(Apr), Vol 14(4), 17-20.—Describes an instructional game concerning the analysis of attitudinal goals into observable indicators. Completion of the game yields a set of objectives as well as a rank ordering of relevant behaviors which are goal-related.

10467. **Topper, Louis.** (Canada Public Libraries, Learning Resources Ctr, Toronto, Ontario) **A communications model to help understand the main problems of AV materials design and use.** *Educational Technology*, 1974(Apr), Vol 14(4), 30-33.—Proposes the use of an "interpersonal communications model" to discover obstacles in the design of audiovisual materials. The model is also appropriate for evaluating the effects of presentation.

10468. **Valley, John R.** **The external degree: Recent developments.** *Findings*, 1974, Vol 1(3), 5-8.—Describes innovations in external degree programs in the US. Education in this context is viewed as a lifelong process that is an integral and continuous part of living. Topics include the use of community resources for education, an increase in the range of support services, the extension of authority to grant degrees, operational across traditional boundaries, granting of credit through course evaluation, and assessing what is learned off-campus. Implications of such programs for the maintenance of academic standards are cited. In addition, the problem of quack programs which do not provide reputable degrees is discussed. Specific programs are described that illustrate these issues.—*R. S. Albin.*

10469. **Van Houten, Ronald; Morrison, Elizabeth; Jarvis, Rowena & McDonald, Margo.** (Mount St Vincent U, Halifax, Nova Scotia, Canada) **The effects of explicit timing and feedback on compositional response rate in elementary school children.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 547-555.—Studied the effects of several variables on compositional response rate in 3 2nd- and 5th-grade classrooms. After establishing baseline composition rates in each classroom, an experimental phase was introduced that consisted of explicit timing of the children's composition period with a stopwatch, immediate feedback on the number of words each child produced, public posting of the greatest number of words written by each child to date, and instructions to try to exceed their highest score. In the 2nd-grade classroom, these conditions were introduced, removed, and reintroduced. In 2 5th-grade classrooms, these conditions were introduced according to a multiple

baseline, across classes. In all cases, introduction of the experimental conditions led to a doubling of rate of words written by students and an increase in subjective quality ratings of compositions made by independent judges.—*Journal abstract.*

10470. **Wexley, Kenneth; Guidubaldi, John & Kehle, Thomas.** (U Akron) **An evaluation of Montessori and day care programs for disadvantaged children.** *Journal of Educational Research*, 1974(Nov), Vol 68(3), 95-99.—Compared 25 children from the Montessori program and 25 from a day-care compensatory program with a disadvantaged control group and an advantaged children group ( $n = 19$  Ss in each). Ss were matched on age (3-5 yrs), race, sex, socioeconomic status, number of parents at home, and years of program participation. 8 tests of cognitive skill were administered. Ss were compared on a composite factor score derived from the 8 tests as a single summary index. Analysis indicated that treatment differences existed on 6 of the 9 analyses. Both preschool programs were effective in raising levels of performance beyond those of other disadvantaged Ss, and both approached middle-class levels of performance, yet the treatment groups did not differ from each other.—*Journal abstract.*

10471. **Williams, John D. & Fogelman, Kenneth R.** (U Sherbrooke, Quebec, Canada) **Sets, logic and intelligence tests.** *Journal of Structural Learning*, 1972, Vol 3(3), 25-36.—Studied the effects of mathematics learning on intelligence test scores of 185 primary school children. Ss were administered the Picture and Primary Verbal I tests of the National Foundation for Educational Research before and after a period of learning mathematics. Control Ss were taught a traditional arithmetic while experimentals were taught modern mathematics. No significant differences were found between groups. It is suggested that while the skills derived from a course in sets and logic are related to performance on intelligence tests, they do not affect the test used here.—*R. S. Albin.*

10472. **Williams, John D.** **Course-component evaluation: I. Rationale and outline.** *Journal of Structural Learning*, 1973, Vol 4(1), 25-31.—Suggests that course evaluation be restricted to comparison of carefully selected component parts rather than entire courses. A sample evaluation of a mathematics course is presented, and it is proposed that this technique could be used for any course.

10473. **Winett, Richard A. & Edwards, Sharon M.** (U Kentucky) **An evaluation plan for educational innovations.** *Journal of Community Psychology*, 1974(Oct), Vol 2(4), 345-351.—Tested a comprehensive evaluation plan that included a number of behavioral, social, ecological, and achievement measures in a small-scale study comparing an open and traditional classroom. Ss were 25 3rd graders of varied socioeconomic backgrounds and heterogeneous abilities. Results, generally supportive of open education, are discussed in terms of the kinds of students profiting from each classroom environment, and applications to other kinds of educational evaluation projects. Points noted are inclusion of other teacher and student variables, possible methodological improvement, and the integration of comparative and experimental studies as a basis for administrative decisions. (24 ref)

—*Journal summary.*

10474. Yawkey, Thomas D. & Jones, Dawn M. (U Wisconsin, Madison) **Application of behavior modification to learning center choices in a kindergarten open education classroom.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 321-328.—Studied the effect of teacher attention on the number of academic activities chosen and completed by 26 kindergarten children. The RIP technique (i.e., rules, ignore, praise) was used to enlarge the academic behavioral repertoires of these children. The data indicate that the RIP technique is useful in manipulating the behavior of children.—H. Kaczkowski.

10475. Young, Carl E.; True, John E. & Packard, Mary E. (Ctr for Human Services Research, Baltimore, MD) **A national survey of associate degree mental health programs.** *Community Mental Health Journal*, 1974(Win), Vol 10(4), 466-474.—Reports on the 1st national survey of associate degree mental health programs and illustrates their development by states. Included are data on current enrollments, percentage of graduates employed, and other related variables.

10476. Ysseldyke, James E. & Salvia, John. (Pennsylvania State U, Ctr for Educational Diagnosis & Remediation) **Diagnostic-prescriptive teaching: Two models.** *Exceptional Children*, 1974(Nov), Vol 41(3), 181-185.—Examined the extent to which 4 assumptions underlying diagnostic-prescriptive teaching are met within 2 models—the ability training model and the task analysis model. Diagnostic-prescriptive teaching assumes that (a) children enter a teaching situation with strengths and weaknesses, (b) these strengths and weaknesses are causally related to the acquisition of academic skills, (c) these strengths and weaknesses can be reliably and validly assessed, and (d) there are well identified links between children's strengths and weaknesses and the relative effectiveness of instruction. It is concluded that the task analysis model meets the assumptions and the ability training model does not. (25 ref)—M. E. Pounsel.

10477. Zankov, L. V. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General Pedagogy, Moscow) **[The problem of education and development.]** (Russ) *Voprosy Psikhologii*, 1974(May-Jun), No 3, 21-30.—Presents an overview of an educational research project begun in 1957 and carried out in 1,200 classrooms in different republics of the USSR. The performance of experimental classes using a new teaching system is compared with that of control groups in 3 lines of activity: observation, intellectual performance, and practical tasks. All comparisons were in favor of the experimental groups, showing quantitative changes in the structure of the students' mental activity. It is argued that the piecemeal approach to educational reform yields insignificant results and that total reorganization of the educational process is necessary to achieve optimum development in children. (English summary)—L. Zusne.

#### Academic Learning & Adjustment & Achievement

10478. Alexander, Karl & Eckland, Bruce K. (Johns Hopkins U) **Contextual effects in the high school educational attainment process.** *Center for Social Organization of Schools Report, Johns Hopkins U*, 1974(Jul), No 178, 29 p.—Presents a multidimensional

mediation model of composition influences. Ability and social status of student body composition are distinguished, and the interpersonal and social comparison processes by which their effects tend to offset each other are specified. The model was examined using data for a national sample first surveyed in 1955 as high school sophomores and followed up in 1970. Results suggest that for both men and women, ability composition mainly affected subsequent outcomes only insofar as it lowered relative performance scores. Status composition affected the likelihood of enrollment in a college preparatory program and for males, the likelihood of associating with college-oriented peers. The absence of a substantial linkage between status context and peer plans for women was found, and several interpretations of this are suggested. (72 ref)—*Journal abstract*.

10479. Alexander, Karl & McDill, Edward L. (Johns Hopkins U, Ctr for Social Organization of Schools) **Social background and schooling influences on the subjective orientations of high school seniors.** *Center for Social Organization of Schools Report, Johns Hopkins University*, 1974(Nov), No 185, 48 p.—Describes a multivariate "school process" model of the ways in which social background and schooling influences combine to affect subjective school outcomes. 4 areas of subjective orientation are considered: educational plans, self-conceptions of competence, intellectualism, and satisfaction with school. The analysis, based on questionnaire and testing data from 20,345 high school seniors, identifies "social background" characteristics (sex, measured ability, and status origins) as important determinants of such outcomes, while school process mechanisms, including curriculum enrollment, characteristics of peer associates, and academic performance, both contribute uniquely to the explanation of subjective orientations and serve as important mediators of background influence. Quite diverse specific patterns of dependency were obtained across outcomes. Finally, 2 underlying dimensions of subjective orientation practically exhausted the explanatory power of predictor variables in relation to the 4 outcomes.—*Journal abstract*.

10480. Bender, Paula S. & Ruiz, Rene A. (U Arizona) **Race and class as differential determinants of underachievement and underaspiration among Mexican-Americans and Anglos.** *Journal of Educational Research*, 1974(Oct), Vol 68(2), 51-55.—Compared a total of 176 Mexican- and Anglo-American 11th graders from the lower and middle socioeconomic classes to determine the nature of interrelations between scholastic performance and race and class. Ss were given a battery of tests (e.g., the Personal Opinion Survey) measuring locus of control, achievement reality orientation, and temporal orientation. These factors were seen as potential correlates of current scholastic performance and future educational and vocational goals. Results indicate that membership in social class rather than racial group was the critical factor in determining current academic achievement, educational aspirations, and belief in one's ability to control his environment. Inferences emerge that generalizations from one ethnic minority group and/or socioeconomic class to another group or class may not be valid. In addition, programs designed to involve low-achieving

and low-aspiring students should take relevant variables such as social class into account in their development. —*Journal abstract.*

10481. Eaves, L. C.; Kendall, D. C. & Crichton, J. U. (U British Columbia, Vancouver, Canada) **The early identification of learning disabilities: A follow-up study.** *Journal of Learning Disabilities*, 1974(Dec), Vol 7(10), 632-638.—Presents follow-up findings of the authors' 1969 study (see PA, Vol 49:7436) which attempted to measure, predict, and define readiness for school and potential problems in learning. Of 228 children who were given a screening test in kindergarten, 163 were followed to the end of Grade 2. At that time they were given an achievement test, and school progress was reported by their teachers. Over 70% of the Ss had been classified correctly as to their achievement on the basis of the kindergarten screening test. The individual test items or subsets of them predicted better than the composite score. Of the 196 psychological, neurological, and academic measures taken on a sample of 50 Ss, a small number were highly predictive of Grade 2 achievement. When achievement by diagnosis was considered, only 11% of the Ss diagnosed in kindergarten as having minimal brain dysfunction were ready for Grade 3, as contrasted to 86% of the normals.—*Journal abstract.*

10482. Feldman, David M. (California State U, Fullerton) **Measuring auditory discrimination of suprasegmental features in Spanish.** *IRAL: International Review of Applied Linguistics in Language Teaching*, 1973(Aug), Vol 11(3), 195-209.—Describes the construction and use of a test of contrastive auditory discrimination of the suprasegmental features of Spanish: intensity, duration, pitch, and terminal contour. Comparison of discrimination of the features when synthesized and isolated vs when spoken indicates that performance was better with synthesized features. Students who had undergone testing ultimately attained better grades in listening to Spanish and in comprehension.—C. A. Sherrard.

10483. Gezi, Kal. (California State U, Sacramento) **Bilingual-bicultural education: A review of relevant research.** *California Journal of Educational Research*, 1974(Nov), Vol 25(5), 223-239.—A review of the literature indicates that when nonverbal ability tests are used and when socioeconomic variables are controlled, bilingual children have as high IQs as monolingual children, if not higher ones in some respects. Reasons for the below-average school achievement of many culturally different students in regular school programs are discussed. (5 p ref)

10484. Gottlieb, David. (U Houston) **Work and families: Great expectations for college seniors.** *Journal of Higher Education*, 1974(Oct), Vol 45(7), 535-544.—Describes an emerging ethic among seniors which places a much greater demand upon work. These students see work as an integral part of one's total life.

10485. Hardy, Clifford A. (North Texas State U) **Student attitudes toward controversial issues: A study of social class.** *Southern Journal of Educational Research*, 1974(Sum), Vol 8(3), 316-325.—Administered the Purdue Master Attitude Scale entitled "A Scale to Measure Attitudes Toward Any Proposed Social Action" to 312 undergraduates. W. L. Warner's Index of Status Charac-

teristics was used to measure social class. Results indicate that (a) while the total group expressed an unfavorable attitude toward busing, they expressed stronger favorable attitudes toward the legalizing of abortion and marihuana; (b) women in general appeared to hold somewhat stronger attitudes along all 3 attitude dimensions, especially in the area of busing, than men; and (c) there appeared to be a negative relationship between attitudes toward busing and social class, while there appeared to be no relationship between social class and the other attitude variables.—*Journal abstract.*

10486. Howe, Michael J. (U Exeter, England) **The utility of taking notes as an aid to learning.** *Educational Research*, 1974(Jun), Vol 16(3), 222-227.—Discusses the effect of note-taking by students on the acquisition of knowledge. Analysis of current research shows that besides recording information, note-taking influences learning by (a) ensuring that learners attend to information; (b) providing a version that is particularly valuable to the individual learner; and (c) directly increasing the scope and accuracy of learned content. It is suggested that further research into the relative effectiveness of different note-taking strategies and training of students in their use can facilitate learning. (25 ref)—J. B. Francis.

10487. Jacobs, Keith W. & Galvin, Kathryn S. (U Southern Mississippi) **Variables which differentiate members and non-members of social fraternities and sororities.** *Southern Journal of Educational Research*, 1974(Sum), Vol 8(3), 342-352.—Administered the Eysenck Personality Inventory, Rotter's Internal-External Control Scale, the Sensation Seeking Scale, and a biographical questionnaire to 86 undergraduates, 22 of whom belonged to social fraternities or sororities. Differences were found between the member and nonmember groups on all 3 personality measures, student voting practices, and attitudes toward several social groups. Several sex differences were also observed, and the only significant interactions were on 2 factors of the Sensation Seeking Scale. It is concluded that students who join social fraternities and sororities can be differentiated from nonmembers, generally without regard for sex differences.—*Journal abstract.*

10488. McConkie, G. W. & Meyer, Bonnie J. (Cornell U) **Investigation of reading strategies: II. A replication of payoff condition effects.** *Journal of Reading Behavior*, 1974(Jul), Vol 6(2), 151-158.—Replicated a study of reading strategies of college students through the use of payoff conditions. Ss were 70 undergraduates. The influence of 4 variables on reading speed and test performance was studied: existence of a payoff structure, the form of the payoff structure, type of payoff, and presence or absence of feedback. The existence of a payoff structure had little effect by itself, but the form of the structure produced significant changes in reading rate. Feedback on performance appears critical in producing substantial reading strategy changes.—*Journal abstract.*

10489. Nowicki, Stephen & Walker, Charlotte. (Emory U) **The role of generalized and specific expectancies in determining academic achievement.** *Journal of Social Psychology*, 1974(Dec), Vol 94(2), 275-280.—Examined the relation of generalized and specific expectancies to actual academic performance. 63 5th and 6th graders

completed the Nowicki-Strickland Personal Reaction Survey for children and Rotter Level of Aspiration Board procedures. Results indicate that those who perceived themselves to be internally controlled or those who used immediate experience on the Rotter board to form accurate expectancies of future performance on this board achieved more than their counterparts. It is suggested that results support the conceptualization of achievement in expectancy terms. (20 ref)—*Journal abstract*.

10490. Politzer, Robert L. (Stanford U) **Developmental sentence scoring as a method of measuring second language acquisition.** *Modern Language Journal*, 1974(Sep-Oct), Vol 58(5-6), 245-250.—Describes how a developmental test of native-language acquisition can be applied to foreign-language acquisition. The application is partially successful (validated) but it is concluded that tests of both kinds are biased by the assumption that both processes are similar.

10491. Scott, Owen; Halpin, Gerald & Schnittjer, Carl. (U Georgia) **Relationships between students' perceptions of college instruction and selected students' characteristics.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 855-860.—Studied the relationships between sex, creativity, life history, and academic achievement and student perceptions of 6 aspects of college instruction—instructional objectives, human relations, use of instructional resources, motivation, content meaningfulness, and measurement and evaluation. Ss were 51 male and 133 female undergraduates who completed a battery of tests including the Inventory of Student Perceptions of Instruction, Torrance Tests of Creative Thinking, and the What Kind of Person Are You? Sex and academic achievement were significantly related to one or more of the aspects of students' perception of instruction. Females perceived their motivation more favorably and meaningfulness of content less favorably than did males. For males, academic achievement was significantly related to perception of instruction, with grade point average and human relations making the largest relative contribution to the relationship.—*Journal abstract*.

10492. Simons, Herbert D. (U California, Berkeley) **Black dialect phonology and word recognition.** *Journal of Educational Research*, 1974(Oct), Vol 68(2), 67-70.—Examined the hypothesis that black children can read words that are closer to their black dialect (BD) pronunciation better than words that are further away. This hypothesis was tested by administering to a total of 76 2nd-, 3rd-, and 4th-grade blacks 2 lists of BD real word homophones, e.g., "cold"—"coal," and 2 lists of nonsense homophones, e.g., "dold"—"doal." It was predicted that the 2nd member in each pair would be easier to read than the 1st because it is closer to BD phonology. A multivariate and univariate analysis of variance of the differences between the closer and further homophones failed to support the prediction.—*Journal abstract*.

10493. Smithers, A. G. & Dann, Sheila. (U Bradford, School of Research in Education, England) **Success and failure among engineers, physical scientists and linguists at a technological university.** *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 241-247.—Analyzed the academic performance of a total of 447

undergraduates in 3 fields of study—engineering, physical sciences, and languages—by comparing the characteristics of successful students with those of the less successful and those who failed to graduate. Results show that Ss who obtained the better degrees generally had the better entry qualifications, and in engineering and the sciences, had reacted less against the industrial training element of sandwich courses. No strong relationship between social class and academic performance was found in engineering and the sciences, but, in languages, the successful students tended to come from nonmanual backgrounds. It is suggested that their acknowledged greater flexibility in their native language may have generalized to foreign languages. In a study of student worries, it was found that those who did less well or did not graduate were aware of their difficulties at an early stage, and were able to articulate them. (16 ref)—*Journal abstract*.

10494. Smithers, Alan; Avis, George & Loble, David. (U Bradford, School of Research in Education, England) **Conceptions of school among pupils affected by the raising of the school leaving age.** *Educational Research*, 1974(Jun), Vol 16(3), 210-217.—Divided 781 3rd-yr students in 4 comprehensive schools into "leavers," defined as those who wished to leave school at age 15; "stayers," those who wished to remain in school until age 18; and a middle group who expected to leave at age 16. Leavers were compared with stayers in terms of sex, social class, and ability. Highly significant relationships were found between desire to stay in school and social class and ability. Students of lower social class and students with lower presumed ability were more likely to be leavers than stayers. Leavers attached more importance to the expressive role of the school, cultural development, and education for leisure. Findings raise questions about the validity of raising the school-leaving age to enable more students to take public examinations. (16 ref)—*J. B. Francis*.

10495. Start, K. B. (U Melbourne, Faculty of Education, Vic, Australia) **Establishing children's learning as the criterion for teacher effectiveness.** *Educational Research*, 1974(Jun), Vol 16(3), 206-209.—Critiques current methods of assessing teacher effectiveness as ambiguous and not expressed in terms of pupil learning. Specifying what dimensions of learning the school is responsible for can lead to the development of criteria for successful learning. Progress on these criteria could be taken as measures of teaching effectiveness. It is concluded that the task is difficult but necessary.—*J. B. Francis*.

10496. Swap, Susan M. (Tufts U) **Disturbing classroom behaviors: A developmental and ecological view.** *Exceptional Children*, 1974(Nov), Vol 41(3), 163-172.—Presents a framework for understanding the behaviors of children which may lead to disturbing encounters within the classroom environment. The ecological perspective on emotional disturbance in children stresses that disturbance does not reside in the child but in the interaction between the child and his environment. Triggering behaviors which are the product of temperamental and developmental differences in children are discussed, and adaptive environmental responses to those behaviors are suggested. (20 ref)—*Journal abstract*.

10497. **Telegdy, Gabriel A.** (Windsor Separate School Board, Ontario, Canada) **The relationship between socioeconomic status and school readiness.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 351-356.—Examined the relationship between socioeconomic status and results of 4 reading readiness tests: the Screening Test of Academic Readiness, the First Grade Screening Test, the Bender-Gestalt Test for Young Children, and the Metropolitan Readiness Test. Ss were 68 kindergarten children. 4 times as many lower-class children as middle-class children were not ready for 1st grade. Human figure drawing, copying, picture completion, and picture completion subtests proved to be useful in selecting students for 1st grade.—*H. Kaczowski.*

10498. **Tomassetti, A. & Bozzano, A.** (Genoa Province Mental Health Service, Italy) **[Psychosocial and personality factors in vocational or academic choice.]** (Ital) *Neuropsychiatria*, 1972(Jan), Vol 28(1-2), 149-168.—A group of 16 boys with school problems and their families were studied in the 6th grade and 5 yrs later to determine the personality and environmental factors leading to their vocational choices. Ss were 11-13 yrs old, with IQs on the WISC of 74-120, and were from culturally deprived families. Their emotional troubles, their families' psychodynamic interferences, the educational systems that influenced their school problems, and their later job choices were examined. Despite school problems, the Ss reached a satisfactory social adjustment through spontaneous selection of jobs which brought them affective rewards, though their jobs were at a level lower than expected from their intellectual ability. Their entrance into the working world was limited by their basic personality patterns and by family difficulties in supporting their higher aspirations. The educational efforts of the school were not successful in reducing their maladjustment or in improving their relational problems or their life difficulties, which were aggravated in the adolescent period. (English, French, & German summaries) (2 p ref)—*A. Felice.*

10499. **Werner, C. Sue & Simpson, Richard L.** (U Kansas) **Attention to task and completion of work as a function of level of adjustment and educational environment.** *Journal of Educational Research*, 1974(Oct), Vol 68(2), 56-58.—Compared the academic performance and attention-to-task behaviors of a total of 36 well-adjusted, moderately-adjusted, and poorly-adjusted 1st graders in an open-space and a traditional, self-contained classroom. Each classroom environment was observed for 50-min periods, with each S being successively observed for 5 sec and marked for attention to task. Results indicate that both academic productivity and attention to task were significantly different as a function of the level of adjustment variable. No significant differences were found for either of the 2 dependent variables as a function of the classroom environment variable, nor were either of the interactions significant.—*Journal abstract.*

10500. **Wetterström, Magnhild.** **[School democracy in grades 1-6: Student opinions.]** (Swed) *Pedagogisk-Psychologiska Problem*, 1974(Jun), No 241, 99 p.—Conducted a series of investigations to determine the attitudes of 1st-6th graders towards participation in decision-making in the school. Results include (a) suggestions made by

the students for improving the school, (b) assessment by different student groups of their present and desired degree of influence, (c) comparisons between the opinions of students and teachers on these questions, and (d) development within this area over a 2-yr period. (37 ref)—*English abstract.*

10501. **Wood, Kenneth; Linsky, Arnold S. & Straus, Murray A.** (Stanford U) **Class size and student evaluations of faculty.** *Journal of Higher Education*, 1974(Oct), Vol 45(7), 524-534.—Found that as class size increased from under 10 to 250 students, ratings of the faculty by students became lower, but that ratings rose again in classes over 250.

### Special Education

10502. ———. **[Greater attention to vocational training and employment of the mentally retarded pupils of special education schools.]** (Russ) *Defektologiya*, 1972, No 4, 3-9.—Offers suggestions, arising from a 1970 government study, to help special education schools prepare mentally retarded pupils for socially useful work. Among the suggestions are the following: (a) The type of vocational training offered by a school should be closely related to the industry near the school; e.g., schools in rural communities should teach different subjects than city schools. (b) In addition to being trained in school workshops, students should be given the opportunity to work in actual jobs. (c) Schools should be required to help their graduates find jobs.—*E. C. Koffman.*

10503. **Bannatyne, Alexander.** (Bannatyne Children's Learning Ctr, Miami, FL) **Reading: An auditory-vocal process.** *Bulletin of the Orton Society*, 1974, Vol 24, 87-102.—Discusses English as a phonetic language, and presents a remedial methodology which involves linguistic code breaking with which the reading skills of the learning-disabled child can be enhanced.

10504. **Berdine, William H.** (U Kentucky, Certification Programs in Mental Retardation) **A comparison of retrieval systems to prescriptively select materials.** *Exceptional Children*, 1974(Nov), Vol 41(3), 195-197.—Compared responses to information requests on instructional materials generated by the Select-Ed Prescriptive Materials Retrieval (PMR) System and the University of Texas Information Retrieval Program. Results show that while the PMR system tended to be rated higher for the descriptive clarity of its abstracts, the differences were not significant.

10505. **Cormany, Robert B.** (West Shore School District, Lemoyne, PA) **Outdoor education for the retarded child.** *Education & Training of the Mentally Retarded*, 1974(Apr), Vol 9(2), 66-69.—Discusses an outdoor education program for the mentally retarded child which involved 50 10-13 yr old children and 10 adults and was continued at the behest of parents, educators, and children. The objective of the program was to provide a central theme for the intermediate special curriculum. From the children's point of view the program was an unqualified success; they appreciated it not only because it was fun but because they found the work interesting. Administrators found it a success because none of the anticipated problems arose; children did not become sick and need to be taken home, and no one became lost or was seriously injured. Most impor-

tant, it was a success because the children learned and retained what they learned.—P. O'Brien.

10506. Cundick, Bert P.; Crandell, John M. & Hendrix, Lee. (Brigham Young U) **A new method for the group testing of blind persons.** *New Outlook for the Blind*, 1974(Nov), Vol 68(9), 398-403.—Because most testing of blind persons is now done on a one-to-one basis, the problems involved in the more efficient group testing of the blind were investigated. 2 main problems were isolated—presentation of the test items and recording of the answers by the Ss. A solution, involving verbal presentation via prerecorded cassette tapes and a specially designed tactual answer board, was devised and tested experimentally with 36 sighted university students. Ss were tested while blindfolded and again while sighted. It was found that testing under blindfolded conditions yielded results that were not significantly different from those obtained via visual test-taking ( $p < .03$ ). Experimentation with these materials using blind Ss is suggested.—*Journal abstract*.

10507. D'Annunzio, Anthony & Steg, Doreen R. (Drexel U) **Effects of individualised learning procedures on children with specific learning disabilities.** *Developmental Medicine & Child Neurology*, 1974(Aug), Vol 16(4), 507-512.—Attempted to individualize remedial approaches to specific learning disabilities (auditory or visual). After careful diagnosis of 12 children 4-6 yrs old, a personal program was developed for each one, consisting of 30 treatment hrs. A control group received a standard, nonspecific program. Results suggest the superiority of an individualized approach. (French, German & Spanish summaries)—P. W. Pruyser.

10508. Daly, David A. & Johnson, Hettie P. (U Michigan) **Instrumental modification of hypernasal voice quality in retarded children: Case reports.** *Journal of Speech & Hearing Disorders*, 1974(Nov), Vol 39(4), 500-507.—Used the Oral Nasal Acoustic Ratio (TONAR) to reduce the hypernasality of 3 mental retardates during a 3-wk treatment period; concomitant improvements in speech intelligibility occurred in 2 Ss.

10509. Das, J. P. (U Alberta, Interdisciplinary Research Ctr, Edmonton, Canada) **How to teach retardates to control their behaviour.** *Indian Journal of Mental Retardation*, 1973(Jan), Vol 6(1), 5-20.—Summarizes a symposium on the development of control in mentally retarded children, held at the 20th International Congress of Psychology at Tokyo, August 1972. S. W. Bijou discussed the application of operant conditioning principles to teaching retardates, and K. Yamaguchi described 3 teaching areas in which he had used behavior modification. V. I. Lubovsky explained his "motor conditioning" method for developing verbal control in retardates. K. Amano reported that rhythm training has been found to contribute to the acquisition of reading skills, and P. E. Bryant discussed differences in the perceptual strategies used by normals and retardates.—J. H. Pflaum.

10510. Edmonson, Barbara. (Ohio State U) **Arguing for a concept of competence.** *Mental Retardation*, 1974(Dec), Vol 12(6), 14-15.—Presents a behavioral description of competence with the argument that failure to adopt such objectives leads to easy satisfaction with the results of training of the retarded and to quick

termination of training. It is argued that the adoption of competence objectives would not only generate more continuous effort at training, but might encourage more innovative methods of training.—*Journal abstract*.

10511. Frame, Phyllis. (George Washington U) **The use of art in remedial tutoring with an 8-year-old boy.** *American Journal of Art Therapy*, 1974(Apr), Vol 13(3), 205-216.—Describes the case of a boy referred to a reading clinic. His intelligence was above average but he had a severe learning disability in the area of visual discrimination. Expressive art therapy enabled him to express fears and anxieties which interfered with his school work and thus to progress in reading and other academic areas.

10512. Frisch, Sue A. & Schumaker, Jean B. (Woolley Wood School, Sheffield, England) **Training generalized receptive prepositions in retarded children.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 611-621.—Used prompting and reinforcement in 2 experiments to teach 3 retarded children (3, 4, and 11 yrs old) to respond correctly to 3 categories of prepositional requests. Training sessions were alternated with probe sessions. During training, a child was trained to respond to 1 request (e.g., "put the doll next to the cup"); during probing, the child was tested for generalization of this training to untrained requests. Responses to untrained requests were never prompted nor reinforced. Results show that, as requests from 1 category were trained, the children's responses to the untrained requests of that category became increasingly correct. As discriminations among 2 or more categories were trained, the children's responses to the untrained requests of those categories also became increasingly correct.—*Journal abstract*.

10513. Gillespie, Patricia H. & Fink, Albert H. (Indiana U, School of Education, Ctr for Innovation in Teaching the Handicapped) **The influence of sexism on the education of handicapped children.** *Exceptional Children*, 1974(Nov), Vol 41(3), 155-162.—Views the sex label as having a pervasive influence on the education of handicapped children. Specific attention is drawn to (a) biases contained within special class curricula which reinforce traditional roles, (b) vocational training practices which program children for economic discrimination by encouraging selection of traditional occupational roles, and (c) special class placement processes which result in the selection of a greater number of boys than girls in all significant areas of exceptionality. The implications for major activities within special education are discussed. (48 ref)—*Journal abstract*.

10514. Gow, David W. (Gow School, South Wales, NY) **Dyslexic adolescent boys: Classroom remediation is not enough.** *Bulletin of the Orton Society*, 1974, Vol 24, 154-163.—Presents a pragmatic discussion of the characteristics of the language-disabled adolescent. Techniques to be used to improve the adolescent's self-concept and social comprehension are suggested. Academic classroom activities are only a part of the remediation process.

10515. Greelis, Michael. (Mental Retardation Inst, Valhalla, NY) **Media stimulation and exceptional children.** *Mental Retardation*, 1974(Dec), Vol 12(6), 30-31.—Describes a media stimulation project which utilizes 2 categories of video equipment—live video

systems and prerecorded video tapes—as a therapeutic aid. The project is based on the assumption that a retarded child who is functioning at a medium to high level can recognize his self-image and will respond favorably. Pilot studies at a mental retardation institute indicate the validity of this presumption.—*M. E. Pounsel.*

10516. **Guerin, Gilbert R. & Szatlocky, Kathleen.** (U California, Ctr for Research in Special Education, Berkeley) **Integration programs for the mildly retarded.** *Exceptional Children*, 1974(Nov), Vol 41(3), 173-179.—Examined programs that integrated mentally retarded students in 8 California school districts. Interviews were conducted with 17 administrators and 31 teachers. Regular classroom observations were made of 27 retarded pupils and 54 randomly selected nonretarded pupils. 4 program models were identified and an index of integration was developed and applied to each program. The attitudes of administrators toward integrating programs, with only 1 exception, was positive, and the majority of teachers also held positive attitudes. The behavior of the retarded students was found to be similar to that of regular students.—*Journal abstract.*

10517. **Iwata, Brian A. & Bailey, Jon S.** (Florida State U) **Reward versus cost token systems: An analysis of the effects on students and teacher.** *Journal of Applied Behavior Analysis*, 1974(Win), Vol 7(4), 567-576.—Studied the effects of reward and cost token procedures on the social and academic behavior of 2 groups of elementary special-education students, using a reversal design. Behavioral observations of 3 target Ss in each group revealed that both procedures were about equally effective in reducing rule violations and off-task behavior. Records kept on the daily arithmetic performance of all Ss showed that output doubled in both groups during the token phases, although accuracy remained unchanged. When students were allowed to choose either contingency, no pattern of preference was established. Small differences were found in teacher behavior: the reward procedure led to an increase in approval comments, but cost procedures produced no changes in teacher behavior.—*Journal abstract.*

10518. **Jenkins, Joseph R.; Mayhall, William F.; Peschka, Corrinne & Townsend, Verlinda.** (U Illinois) **Using direct and daily measures to increase learning.** *Journal of Learning Disabilities*, 1974(Dec), Vol 7(10), 605-608.—Conducted a study of 6 6-9 yr old primary-level learning-disabled children to examine the effects of direct and daily measurement of Ss' performance on their learning. In one condition a resource teacher had access to these measures; in another condition these measures were not available. Results show that Ss increased their rate of word recognition significantly more when these measures were available.—*Journal abstract.*

10519. **Jones, Fredric H. & Miller, William H.** (U Rochester) **The effective use of negative attention for reducing group disruption in special elementary school classrooms.** *Psychological Record*, 1974(Fal), Vol 24(4), 435-448.—In a private school for 9-14 yr old behaviorally deviant children, 2 teachers who led orderly discussions were designated as "comparison teachers" and 2 whose discussions were characterized by excessive disruptiveness were designated "target teachers." Appro-

priate and disruptive student behaviors as well as positive, neutral, and negative teacher attention contingent upon each class of student behavior were recorded. In an ABA design with follow-up, the target teachers were trained to dispense negative attention contingent upon student disruptiveness in a manner similar to that of the most effective comparison teachers. Intervention reduced disruptiveness in the target classrooms, and follow-up indicated that skills learned by target teachers were being used effectively 3 mo later. Comparison teachers decreased use of negative attention throughout the year without loss of classroom control.—*Journal abstract.*

10520. **Karen, Robert L.; Elsner, Melvin & Endres, Robert W.** (California State U, San Diego) **Behavior modification in a sheltered workshop for severely retarded students.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 338-347.—Conducted a study of 10 severely retarded 16-19 yr olds to investigate the effects of a token system and a prosthetic modification (screening of a sheltered workshop area) on Ss' work behavior. Task-specific performance measures of average error and production in each of 5 nursery-can production tasks and the generalized work performance measure of average visual inattention-verbal prompt were observed during baseline, training, and follow-up. Grouped data reveal differences in task difficulty, a reduction in average error, and an increase in average production with the tokens. Average visual inattention-verbal prompt decreased irrespective of the tokens, and there were individual differences in average error, production, and visual inattention-verbal prompt.—*Journal abstract.*

10521. **Kazdin, Alan E. & Forsberg, Sara.** (Pennsylvania State U) **Effects of group reinforcement and punishment on classroom behavior.** *Education & Training of the Mentally Retarded*, 1974(Apr), Vol 9(2), 50-55.—Used group token reinforcement and punishment procedures to alter appropriate behaviors in a class of educably retarded students. Baseline observations were made to determine the rate with which 6 11-12 yr old students were performing appropriate behaviors. A group token program was implemented where students could earn points if the entire class was paying attention when a timer sounded at various time intervals. Points earned could be exchanged at the end of each day for a special event. This program was removed and points were given to the group independent of performance. In the final phase a punishment procedure was used in which points were given at the beginning of the class session and withdrawn from the group if anyone was not attending when the timer sounded. Results show that appropriate behaviors increased over baseline during the reinforcement and punishment phases. Performance tended to decline when the tokens were delivered without requiring appropriate behavior. Practical advantages of group procedures are discussed. (19 ref)

—*Journal abstract.*

10522. **Keogh, Barbara K. & Hall, Robert J.** (U California, Los Angeles) **WISC subtest patterns of educationally handicapped and educable mentally retarded pupils.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 296-300.—The scaled scores of the WISC for 157

Ss were grouped according to Witkin's 3 factors (e.g., verbal comprehension, attention-concentration, and analytical-field-approach). Significant differences in analytical, attention, and verbal-index scores were obtained. It is concluded that treatment programs should be individualized after diagnosis because standardized approaches designed to help these types of children tend not to be helpful.—H. Kaczkowski.

10523. Kiraly, John & Morishima, Akira. (U Iowa) **Developing mathematical skills by applying Piaget's theory.** *Education & Training of the Mentally Retarded*, 1974(Apr), Vol 9(2), 62-65.—Discusses considerations in developing mathematical skills for the trainable mentally retarded child, using Piaget's ideas of concreteness for developing instructional skills. A curriculum guide is presented for developing mathematic skills, and instructions are included for using the curriculum. It is stressed that abstract thinking is difficult for the trainable retarded; therefore, mathematics skills should be concrete and useful in the everyday life of the child.—P. O'Brien.

10524. Laus, Michael D. (Pittsburgh School System, PA) **Orientation and mobility instruction for the sighted trainable mentally retarded.** *Education & Training of the Mentally Retarded*, 1974(Apr), Vol 9(2), 70-73.—Reports on a program designed for the trainable mentally retarded (TMR) in public school curriculums. Ss were 35 pupils from an inner city TMR program with a mean age of 16 yrs and an IQ mean of 42.7. The group had normal corrected visual acuity. Orientation in the classroom and both classroom and outdoor mobility instruction were initiated. Results show that Ss were able to safely and independently travel within their community after receiving such instruction. After 1 school year of instruction 35 pupils were traveling independently to and from school by public transportation. Adolescents who previously were transported daily from their doorstep by leased vans were initiating their own travel to and from school. It is suggested that orientation and mobility instruction should now be considered an integral part of the total curriculum for TMR pupils in the public schools.—P. O'Brien.

10525. Lichtenberger, Waldemar. [Education and instruction of the handicapped inside and outside of the "Gesamtschule." (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(2), 130-135.—Questions the practice whereby children of marginal ability and those with deficient hearing, sight, speech, etc, because of deprived circumstances, or with general maladjustment attend special schools for the retarded with smaller classes and well-trained teachers. Although many leave these schools with normal achievements, they encounter extensive prejudice on jobs. An integration of these children into a "Gesamtschule" or complete school, where all levels are present under 1 roof, is proposed to reduce these difficulties. (English summary)—W. O. Horn.

10526. Long, Peggie A. & Anthony, John J. (School Board of Alachua Cty, Gainesville, FL) **The measurement of mental retardation by a culture-specific test.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 310-312.—Gives a number of correlations between the WISC and the Black Intelligence Test for Cultural Homogeneity. Ss

were 30 black students in classes for the educable mentally retarded (EMR). It is concluded that EMR students will score poorly on test instruments regardless of cultural specificity built into the instrument.—H. Kaczkowski.

10527. Malin, A. J. **Landmarks "down under" in mental retardation.** *Indian Journal of Mental Retardation*, 1973(Jan), Vol 6(1), 21-23.—Reports on the 12th International World Congress on Rehabilitation, held in Australia in August 1972 and attended by 2,000 delegates from 60 nations. One of the inaugural addresses described the Swedish model of "open education," which integrates the mentally retarded into normal classrooms. The Swedish situation is contrasted with that of India, where approximately half a million retardates are born annually. Since even normal classrooms are now overcrowded in India, the education of retardates is neglected and not much improvement can be foreseen.—J. H. Pflaum.

10528. McClelland, Jane. **Adolescents: It's never too late to learn.** *Bulletin of the Orton Society*, 1974, Vol 24, 141-153.—Considers diagnostic and remedial approaches to reading, spelling, writing, and speaking deficits of adolescents. Examples of these disabilities and their treatment are included.

10529. Morris, Richard J. & Dolker, Michael. (Syra-cuse U) **Developing cooperative play in socially withdrawn retarded children.** *Mental Retardation*, 1974(Dec), Vol 12(6), 24-27.—Compared 3 approaches (high-low dyad, low-low dyad, and experimenter-low shaping) to the development of cooperative play in 6 severely retarded 4-12 yr olds. Results show that pairing a high and low interacting child and the shaping procedure produced the greatest amount of cooperative play. No appreciable increase in cooperation was found by pairing 2 low interacting children or in the no-treatment condition. These results were maintained at the 3-wk follow-up evaluation.—Journal abstract.

10530. Morris, Robert H. (California State Dept of Transportation, Sacramento) **A play environment for blind children: Design and evaluation.** *New Outlook for the Blind*, 1974(Nov), Vol 68(9), 408-414.—Describes an environment comprised of 8 circular play courts arranged around a 9th court which was designed on the basis of the idea that play could be used to help blind children learn orientation skills essential for their development as individuals. Sensory stimulation, especially hearing and touch, and spatial perception are integral parts of the environment, as is the requirement that the child actively participate in order to enjoy the activities. Tactile maps and recorded instructions are also utilized. The design was presented for evaluation to a panel of experts, including orientation and mobility instructors, teachers, a psychologist, a recreation therapist, and a research designer. A majority judged the concept, the overall design, and the design of the individual elements to be "effective" or "very effective" in promoting the development of orientation skills in blind children.—Journal abstract.

10531. Mosher, Richard. (U Ottawa, School of Physical Education & Recreation, Ontario, Canada) **Effectiveness of perceptual-motor programs: An update.** *Journal of Leisureability*, 1974(Oct), Vol 1(4), 10-17.

—Reviews experimental evidence on the effectiveness of perceptual motor programs, particularly those for learning disabled children. The assumption on which most programs are based—that improvement in motor skills will generalize to cognitive tasks—is not supported by the majority of the studies in this area. Emphasis on the specificity of learning is increasing, and an alternative approach is teaching specific cognitive concepts using physical techniques. It is noted that most programs do not distinguish between different types of learning disabilities and that further research may identify variables that could facilitate development of more effective programs. (29 ref)—C. Wright.

10532. Reger, Roger. (Board of Cooperative Educational Services, Buffalo, NY) **A case study of the effects of labeling.** *Journal of Learning Disabilities*, 1974(Dec), Vol 7(10), 650-651.—Discusses the appropriateness and relevance of labeling children who need special education. It is suggested that this case study belies the assumption that labeling is necessarily tied to the funding and provision of services.

10533. Riding, R. J. & Shore, J. M. (U Birmingham, School of Education, England) **A comparison of two methods of improving prose comprehension in educationally subnormal children.** *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 300-303.—Conducted a study of 100 educationally subnormal 9-16 yr olds to compare 2 methods of facilitating Ss' aural reception. Under the 1st method, an attempt was made to improve Ss' listening comprehension by providing images of the concepts in prose detail to facilitate recoding; the 2nd method decreased the rate of presentation to allow more time for Ss to analyze and store the material. Both methods produced similar significant improvements in recall performance. Ways of studying the recoding performance of educationally subnormal children to provide information to enable further improvement in reception are examined. (15 ref)—*Journal abstract*.

10534. Stoppleworth, Leland J. (Central Connecticut State Coll) **Special education and reinforcement theory: Are we reinforcing deficient behavior?** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 357-359.—Discusses the consequences of the practices of giving extra help to children who are having difficulty with a subject. It is suggested that the handicapped child's environment be analyzed with the same intensity as deficits purportedly caused by internal factors.

10535. Turnbull, Ann P. (North Carolina Memorial Hosp, Div for Disorders of Development & Learning, Chapel Hill) **Teaching retarded persons to rehearse through cumulative overt labeling.** *American Journal of Mental Deficiency*, 1974(Nov), Vol 79(3), 331-337.—20 educable mentally retarded children (mean age = 11 yrs), divided into 2 treatment groups, were given a pretest, 14 training sessions, and a posttest on a 7-position serial memory task. Experimental Ss were given specific instructions in cumulative overt labeling and practiced this technique with prompting during the 14 training sessions. On the posttest with no accompanying instructions to rehearse, all experimental Ss continued to engage in cumulative overt labeling and performed significantly better than controls. Findings are discussed

in terms of a production deficiency model with comparisons made to other rehearsal and training investigations.—*Journal abstract*.

### Counseling & Measurement

10536. ———. **Evaluation and assessment of educational research: Methods of educational enquiry, Block 6.** Bletchley, England: Open University Press, 1973. 52 p.—Presents a student workbook on the skills needed to evaluate 3 examples of published research reports on educational achievement. Specific activities include how to develop criteria for evaluating research and apply them to the actual reports. Sample evaluations are included, along with guidelines for understanding the structure of a research paper and determining whether the methodology is adequate for the goals of the study.

10537. Alvord, David J. & Brittingham, Barbara E. **Evaluating performance on national assessment objectives: Norm-referenced and criterion-referenced interpretations.** *Journal of Educational Research*, 1974(Oct), Vol 68(2), 59-61.—Utilized National Assessment of Educational Progress exercises to assess performance on specific reading objectives. The method of data analysis encompassed both norm-referenced and criterion-referenced interpretations of pupil performance. Reading assessment results from 1,105 4th graders indicate, from both norm- and criterion-referenced aspects, that performance was sufficient to suggest attainment of the objectives. Problems associated with certain aspects of the criterion-referenced interpretations are discussed and recommendations for solutions explored.—*Journal abstract*.

10538. Aschersleben, Karl. (Niedersachsen Coll of Education, Hannover, W Germany) [Transformation and standardization in education and psychology.] (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(2), 118-129.—Defines and explains, using examples, linear, plane, rectangular transformations and normalizations of raw data. Grades, C and stanine norms, IQs, Z and T scores are compared and evaluated. (English summary) (35 ref)

10539. Bernal, Ernest M. (U Texas, San Antonio) **Gifted Mexican American children: An ethno-scientific perspective.** *California Journal of Educational Research*, 1974(Nov), Vol 25(5), 261-273.—Determined whether behavioral descriptors abstracted from interviews with Mexican-American barrio residents could be used to differentiate gifted Chicano children from their average peers. A purposive sample of 54 5-9 yr old gifted and average children from 2 Texas cities was tested with 3 different instruments—the WISC, the Torrance Tests of Creative Thinking, and E. A. De Avila's Cartoon Conservation Scales. Ratings on 43 behaviors were subjected to multiple discriminant analysis. Results indicate that 9 items had high discriminant power, including high grades in school, large vocabulary for S's age, and ability to learn quickly. Chicano views on giftedness are summarized, and implications for cross-cultural research and education are discussed. (27 ref)—*Journal abstract*.

10540. Borman, Christopher & Reilly, Robert R. (Texas A&M U) **Vocational guidance in the '70's.** *Texas Personnel & Guidance Association Journal*, 1972(Sep), Vol

1(1), 32-37.—Reports on 4 conferences held in each of 4 Texas cities, and the resulting strategy developed by the planners for counselors in vocational guidance. The conference speakers stated that high school curriculums are inappropriate for 60% of the students. Career development cannot be separated from personality development; vocational guidance must therefore be concerned with attitudes and attitude change. It might also involve the identification and possible alteration of a counselor's values and expectations.—*H. H. Crouch.*

10541. **Burke, William M.** (U Massachusetts Medical School, Worcester) **Attitudes and the utilization of health services.** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 320-324.—Administered a questionnaire to a probability sample of 718 college students to determine the relationship between attitudes and the decision to utilize professional medical services and the type of service utilized. 56.3% of the respondents, with a higher proportion of females, utilized some type of medical service. Females also reported more days of restricted activity (need). Variables measuring reported symptoms and days of restricted activity (morbidity) were the best predictors of utilization. Attitudes, while significant in the decision to utilize professional medical services, were more significant in the decision concerning type of service to utilize.—*F. Beyer.*

10542. **Capuzzi, Dave.** (Our Lady of the Lake Coll, Counselor Education Program) **Academic skills counseling: Guidelines for program implementation.** *Texas Personnel & Guidance Association Journal*, 1972(Sep), Vol 1(1), 25-31.—Provides suggestions for counselors interested in implementing future academic programs. The counselor can work individually or with small groups. He should ascertain which clients have attitude or personal concerns and which have weak study and reading skills. Self-reports, tests, and feedback from instructors can be utilized. It is suggested that clients commit themselves to 3 1-hr sessions/wk, the 1st for attitude and personal concerns, the others to develop study and reading skills. Objectives for the study and reading skills area are given, and questions for the counselor to ask before attempting academic skill counseling are suggested.—*H. H. Crouch.*

10543. **Cary, Gene & Papalia, Anthony S.** (Milton Hershey Medical School, Hershey, PA) **A college mental health program that works.** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 288-294.—Describes the addition of psychiatric services to a small state college and the resulting collaboration and integration of the psychiatric, counseling, and medical services. Several case histories are presented to illustrate the interaction between the 3 services in evaluating and treating various medical, psychiatric, and educational problems. Initially the counseling center acts as the main channel of communication by referring most psychiatric and medical cases. Further collaboration is exemplified by interdisciplinary staff conferences and consultations and supervision when needed. Results of the integrated program show an increase in use of services in addition to more effective functioning of the individual disciplines. (23 ref)—*F. Beyer.*

10544. **Crabbs, Michael A. & Kissler, John M.** (Westside High School, Omaha, NB) **Guidance innova-**

**tions: Videotaping for relevance.** *Audiovisual Instruction*, 1974(Sep), Vol 19(7), 20-23.—Based on the experiences of a secondary school guidance department, it is suggested that videotape equipment may be a valuable tool for the dissemination of career and educational material to students. The development and effects of videotapes on such topics as college entrance test interpretation and the college planning process are described. Questionnaire evaluation by high school juniors indicates that 262 (86%) felt the videotapes had been worthwhile and would be willing to watch over videotapes on college information. Implications for school counselors are discussed.—*A. Olson.*

10545. **Craig, Thomas J.** (Johns Hopkins U, Medical School) **Evaluating utilization and outcome in a small college mental health service: Implications for future planning.** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 295-301.—Examined the functioning of a system-wide approach to mental health care in a small 4-yr professional arts college. The mental health service consisted of a consulting psychiatrist, a referral clinic, and informal sessions—moderated by the Dean of Students—for students with less severe problems. Clinical and academic records of students utilizing psychiatric services during 1 academic year were reviewed. Data indicate that the majority of the 44 students seen were freshman and junior transfers experiencing situational disorders. The need was established for prevention measures for identifying 2 generally unrecognized groups, those with psychotic experiences and those dropping out of school. Significant increases in grade point averages were indicated following consultation, particularly for students who followed through on referrals. The importance of defusing responsibility for prevention, identification, treatment, and rehabilitation is discussed. (23 ref)—*F. Beyer.*

10546. **Dinkmeyer, Don.** (DePaul U) **Facilitating communications: A mutual concern of counselors and teachers.** *Texas Personnel & Guidance Association Journal*, 1973(Mar), Vol 2(1), 4-11.—Sees the counselor's role as affecting teacher-student relationships and class-run processes. The counselor should provide service beyond the one-to-one (and small group) counseling; he should also be a consultant to the staff and a coordinator of staff-student activity. 2 procedures are described which personalize and humanize relations between teachers and students: (a) the "C" group format with teacher groups, so called because the 10 factors that make the group effective begin with "C" (collaboration, consultation, clarification, etc); and (b) the program called Developing Understanding of Self and Others (DUSO), with 1 kit for kindergarten and the primary grades, and 1 for Grades 3 and 4. Students in the DUSO program become responsible for their own learning. The counselor demonstrates materials in classrooms and conducts practical in-service experiences which help teachers acquire competency in intellect-affect-behavior education.—*H. Crouch.*

10547. **Doyle, Kenneth O. & Whitely, Susan E.** (U Minnesota, Measurement Services Ctr) **Student ratings as criteria for effective teaching.** *American Educational Research Journal*, 1974(Sum), Vol 11(3), 259-274.—Discusses the concern felt in many quarters about the use of

student ratings as criteria for effective teaching. A rating instrument was administered to students in a multisection beginning-language course. Across- and between-sections data were studied for generalizability and validity. Results indicate that student ratings overlapped with one of the principal criteria of teaching effectiveness, i.e., classroom achievement, yet possessed a unique component. Ramifications of the "across" and "between" distinction are explored.—*Journal abstract.*

10548. Eisenberg, Sheldon. (Syracuse U) **Exploring the future: A counseling/curriculum project.** *Personnel & Guidance Journal*, 1974(Apr), Vol 52(8), 527-533.—Proposes the establishment of a curriculum that will engage students in a study of the future. The goals of this curriculum are to (a) help students develop a sense of personal agency toward their futures, and (b) help them acquire the skills involved in planning and decision making. To lead this process of exploring personal futures should be an inherent function of counselors.—*J. F. McIlvaine.*

10549. Feshbach, Seymour; Adelman, Howard & Fuller, Williamson W. (U California, Los Angeles) **Early identification of children with high risk of reading failure.** *Journal of Learning Disabilities*, 1974(Dec), Vol 7(10), 639-644.—Compared 2 alternative models for identifying kindergarten-age children with a high risk of becoming reading failures. One model places primary emphasis on psychometric test procedures assessing linguistic and perceptual-motor skills related to reading readiness. The alternative strategy is based upon the kindergarten teacher's evaluation of the child's skills and behavior, with particular emphasis on the discrepancy between a child's specific competencies and those required for success in a particular 1st-grade classroom. Data were obtained from use of both strategies with 1,732 kindergartners from 10 middle-class urban schools. Significant correlations resulted between the various measures taken in kindergarten and reading achievement test scores obtained at the end of 1st-grade.—*Journal abstract.*

10550. Friedman, William H. & Reifler, Clifford B. (U North Carolina, Chapel Hill) **How come you guys in mental health don't see more patients?** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 274-278.—Traditionally, campus medical and mental health services use the number of patients seen per unit of time as an indicator of activity. This practice results in the misleading conclusion that mental health workers see only a small number of patients. Differences between the medical and mental health practices are discussed in terms of "indirect services," and the alternative of accounting for number of staff hours paid for by the health service instead of reporting a patient count is suggested. A detailed system for reporting time is presented and its success in 4 clinics is discussed.—*F. Beyer.*

10551. Goetzl, Ugo. **The traditional role of a psychiatric consultant in a nontraditional college.** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 284-287.—Discusses the establishment and operation of a part-time consulting psychiatrist arrangement to fulfill the needs of a small nontraditional college. In contrast to most mental health literature, the

community psychiatry model was limited in its usefulness.

10552. Kennedy, Helena. (Seattle Area School System, WA) **Changes in task-specific self-concepts after vocational evaluation.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Jun), Vol 7(2), 27-33.—Studied 20 high school age reluctant learners (students with learning problems caused by anything other than mental deficiency) to determine whether task-specific self-concepts became more accurate after 2 wks of vocational evaluation and exploration. Students were assigned vocational evaluators and an abilities self-rating form (ASRF) was administered on the first and last days of the study. Evaluator ratings of student aptitudes were obtained using the Client Performance Rating Form, a parallel of the ASRF. Results support the hypothesis that, following the 2-wk program, student self-concepts relating to the ability to perform specific tasks would change in the direction of increased agreement with vocational evaluator observations of performance.—*A. de la Haba.*

10553. Kirshner, Lewis A. (Harvard U, Health Services) **A follow-up of a freshmen group counseling program.** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 279-280.—Examined the motivation, needs, and degree of emotional disturbance of 53 freshmen in a counseling program. Student volunteers participated in informal weekly discussions, led by psychiatrists and psychologists, which emphasized college adjustment. 83% ( $n = 44$ ) of the students who attended at least 1 meeting responded to questionnaires as part of a 1-yr follow-up. Motivation for attendance was indicated by a desire for therapy and interest in meeting others. Although a high degree of emotional disturbance was reported, in most cases the counseling experience eliminated the seeking of psychiatric help. The program is considered an effective preventive measure for dealing with "problem students."—*F. Beyer.*

10554. Laurer, Philip J. (U Arizona, Coll of Education) **Consulting with teachers: A systematic approach.** *Personnel & Guidance Journal*, 1974(Apr), Vol 52(8), 535-540.—Stresses that counselors need and wish to reach more students through effective consultation with teachers. While the desirability of consulting has been established in professional literature, the counselor may be uncertain about how to begin a consulting role and relationship with teachers. Systematic procedures to develop this consulting relationship are discussed.—*J. F. McIlvaine.*

10555. Lindell, Ebbe. **[What is good language? Some results from the project FRIS: Free writing in the intermediate stage of the comprehensive school.]** (Swed) *Pedagogisk-Psykologiska Problem*, 1974(Nov), No 251, 9 p.—Reports findings of studies which suggest that the quality of essays can be described by the aid of objective data from linguistic analyses. It is suggested that judges of essays take both creativity and correctness into consideration.

10556. Lucas, C. J. & Crown, Sidney. (University Coll London, Health Ctr, England) **Concepts and methods in student mental health.** *British Journal of Psychiatry*, 1974(Dec), Vol 125, 595-603.—Describes some changes which have occurred in the models on which psychiatric

practice in a university or college setting is based, emphasizing the practical consequences of different models for treatment, teaching, and training. The historical development of student health services in Great Britain is outlined, and the current relevance of the medical, psychological (e.g., psychodynamic, psychoanalytic, behavioral, cognitive, and psychometric), counseling, and social-interactional models of mental health to student problems is examined. It is concluded that future research should aim at both the theoretical classification of these models and at cost-benefit evaluations of them to determine their suitability for different disorders and patients.—*L. Gorsey.*

10557. Lujan, Sylvia S. & Aleman, Ramon. (Pan American U, Counseling Ctr) **El chavalo de los hijos de MACEP. (The grandchild of MACEP).** *Texas Personnel & Guidance Association Journal*, 1973(Mar), Vol 2(1), 23-30.—Evaluates a 1-semester guidance and counseling program, conducted after the authors had been trained at the Mexican-American Counselor Education Project (MACEP). Each author was assigned to 3 schools, involving a total of 87 teachers and 2,200 children, kindergarten through 8th grade. Each shared office space with nurses, which meant distractions during counseling sessions. They could appreciate the conflicts of biculturalism which they themselves had experienced as adolescents. These evaluations will help to plan future cooperative counseling.—*H. Crouch.*

10558. Maitland, Suzanne; Nadeau, J. B. & Nadeau, Gretchen. (Dartmouth Coll, Medical School) **Early school screening practices.** *Journal of Learning Disabilities*, 1974(Dec), Vol 7(10), 645-649.—Conducted a questionnaire survey of 980 US school districts to determine the prevalence of early school screening practices, the specific tests employed, and the use made of the test results. Data from 581 responding districts indicate that a majority did screen, and there was great variability in the measures they employed. Although there are many published measures for kindergarten and 1st-grade, only the Metropolitan Readiness Tests were used by a high percentage of school districts. Tests given at the end of the kindergarten year were most often used for determining 1st-grade placement; tests given at the beginning of the kindergarten or 1st-grade year were used equally often to individualize instruction.—*Journal abstract.*

10559. Marcotte, Donald G. (Niles Township Community High School, North Div, Skokie, IL) **An approach to the problem student problem.** *Personnel & Guidance Journal*, 1974(Apr), Vol 52(8), 548-551.—Discusses the strategic program implemented by a high school to coordinate the pupil personnel staff in reducing patterns of misbehavior, truancy, and academic failure for entering students. The program consisted of a series of counseling seminars in which the students were given information and training to (a) reduce anxiety-producing situations; (b) promote optimal educational, social, and emotional growth; (c) assist them and their parents in developing positive attitudes toward the school and to assist the school in maintaining positive attitudes toward the students; and (d) encourage students to take advantage of academic and extracurricular activities. A

detailed description of the program and its guidelines are presented.—*J. F. McIlvaine.*

10560. McNeil, Keith A. & Phillips, Beeman. (Educational Monitoring Systems, Ann Arbor, MI) **The factor structure of the School Anxiety Scale in a college population.** *College Student Journal*, 1974(Sep-Oct), Vol 8(3), 63-67.—Revised the Test Anxiety Scale for Children (TASC), which contained 198 items, to create a 24-item School Anxiety Scale (SAS) as a measure of test-anxiety among a college population. The SAS was administered to 788 male and female Ss at Southern Illinois University. 5 factors, accounting for 87.8% of the variance, were identified: (a) Fear of Rejection by Others, (b) Fear of Taking Tests, (c) Lack of Confidence in Meeting Expectations by Others, (d) Physiological Reactivity Associated with Low Tolerance of Stress, and (e) Peer Evaluation.—*A. J. Ter Keurst.*

10561. Neville, Mary H. & Pugh, A. K. (U Leeds, England) **Context in reading and listening: A comparison of children's errors in cloze tests.** *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 224-232.—Tested 66 9-10 yr olds in 2 groups with 2 parallel forms of a cloze test of silent reading comprehension—the GAP Reading Comprehension Test. The same tests were then given as cloze tests of listening comprehension. Each group received different parallel forms in each of the language modes. The scores for the listening tests for both groups were significantly lower than the reading scores. Significantly fewer responses were made in the listening mode. Analysis of errors made in both modes reveal that 44% of errors in the reading tests and 37% of errors in the listening tests were syntactically appropriate responses. (29 ref)—*Journal abstract.*

10562. Peterson, Carol J. (St Mary's Junior Coll, Nursing Project, Minneapolis, MN) **Development of oral quizzes in a multimedia approach.** *Educational Technology*, 1974(Apr), Vol 14(4), 47-51.—Argues that oral quizzes are preferable to written objective tests in certain instructional situations because they tend to require responses at higher cognitive levels. Oral quizzes also provide practice in social interaction as well as exercising the students' verbal skills. A scoring system is described. Students regard these oral quizzes with mixed feelings.—*C. B. Kreitzberg.*

10563. Prout, H. Thompson & Phillips, Preston D. (Indiana U) **A clinical note: The kinetic school drawing.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 303-306.—Describes how the Kinetic School Drawing can be used as a projective instrument in a clinical battery to assess the child's perception of himself, his teachers, and his peers. Several examples are given.

10564. Rosenstock, Harvey A. & Hansen, Douglas B. (Baylor Coll of Medicine, Houston, TX) **Toward better school adaptability: An early adolescent group therapy experiment.** *American Journal of Psychiatry*, 1974(Dec), Vol 131(12), 1397-1399.—Reports an experimental study in which 8 7th graders with behavior problems in school were given group therapy during school hours. Compared with a control group of 8 problem students who received no therapy, the students who participated in group therapy showed significantly improved behavior on 2 measurements. It is concluded that in-school group therapy is an effective means of increasing the adaptability

ity of young adolescents with behavior problems to the academic and interpersonal milieu of school.—*Journal abstract*.

10565. Rothman, Carole. (Herbert H. Lehman Coll, City U New York) **Differential vulnerability of WISC subtests to tester effects.** *Psychology in the Schools*, 1974(Jul), Vol 11(3), 300-302.—Reports on the vulnerability of WISC subtests to tester effects under ordinary testing conditions. Overall results are in agreement with other studies that investigated this problem.

10566. Röhm, Hartwig. [Problems of student evaluation.] (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(2), 94-102.—Stresses the influence of grading achievements as well as the personality on students' self-concepts, motivation, and future employment. Examples of the unreliability of grading essays and the influence of social background, sex, etc, are cited. 4 school episodes are described to illustrate stereotyping, prejudice, projection, and rigidity. The significance to these teacher attitudes in coping with student behavior and in the teacher's mental hygiene are discussed. (English summary) (22 ref)—*W. O. Horn*.

10567. Smits, B. W. (Katholieke U, Inst voor Onderwijskunde, Nijmegen, Netherlands) **[A random sample investigation by means of the similarity of norms.]** (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(May), Vol 29(3), 213-227.—Measured the reliability of the following standardized tests: the Mechanical Ability in Reading Test (MART) by S. Wieggersma; the Interest, School Progress and Intelligence Test (ISIT) by J. T. Snijders and V. J. Welton; the Achievement Motivation Test (AMT) by H. J. Hermans; the School Entrance Test (SET) by J. Luning Prak; and the Pintner-Durost Lower School Test (LST) revised by Luning Prak. Published norms of the tests are compared with those obtained by testing pupils in 25 schools. Results indicate that the norms of the MART were reliable. Those of the ISIT were acceptable, although some of the published norms were too low. Differences between published and test norms of the AMT were minor. For the SET and LST, the lack of information about the conditions of the original samplings raises questions about the reliability and validity of the results of the tests.—*A. J. Ter Keurst*.

10568. Stubbs, Joseph B. & Tucker, G. Richard. (American U Beirut, Lebanon) **The cloze test as a measure of English proficiency.** *Modern Language Journal*, 1974(Sep-Oct), Vol 58(5-6), 239-241.—Evaluated the use of the cloze test in assessing foreign students' proficiency in English. A high correlation was found between exactly correct responses and contextually acceptable responses ( $p < .01$ ), indicating that only the 1st type of response need be scored.

10569. Van der Ven, Ad H. (U Nijmegen, Psychological Lab, Netherlands) **The correlation between speed and precision in time-limit tests.** *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Sep), Vol 29(6), 447-455.—Presents 2 models of the relationship between speed and precision. Model 1 postulates that for a given S precision is a monotonically linear function of decreasing speed. Another assumption for Model 1 is that precision is a uniparametric function of speed. In a study of 8- and 9-yr-old children, the Ss were asked to

indicate a special grouping of dots among 25 designs, and were then motivated to increase their speed. The number of items selected increased enormously but the proportion of correct markings did not change. Model 2 is based on the concept that precision remains constant while speed varies. The covariance of precision and expected speed is zero. The factor of mental effort cannot be measured directly.—*A. J. Ter Keurst*.

10570. Vincent, Denis. (National Foundation for Educational Research, Guidance & Assessment Service, Windsor, England) **Reading ages and NFER reading tests.** *Educational Research*, 1974(Jun), Vol 16(3), 176-180.—Discusses practical and theoretical weaknesses of the concept of "reading age." Methods of computing average reading age are ambiguous, and there is a tendency for reading age to become a fixed property of a pupil rather than an estimate of his standing relative to time of testing or choice of test. Because too little is known of relationship between age and reader development, the assumption that there is a linear pattern of reading development over time is unwarranted. The "reading age" concept is easily misunderstood by parents and teachers. It is suggested that there is a strong case for abandoning it in favor of other kinds of scales employed in modern education.—*J. B. Francis*.

10571. Wathelet, André (Ctr psycho-medico-social, Ixelles, Belgium) **[A psychopedagogical explanation of the development of a 4th primary grade arithmetic test.]** (Fren) *Revue Belge de Psychologie et de Pédagogie*, 1973(Dec), Vol 35(144), 89-112.—Reports on the creation of a new test of arithmetic achievement for 4th graders in Belgium. Guidelines of the American Psychological Association were followed throughout. Detailed analysis indicates that discrimination, validity, reliability, and other factors of the completed test are acceptable.

10572. Weiner, Hubert. (Northern Illinois U) **A comparison of frequent and non-frequent health service users.** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 315-319.—Studied the relationship between 16 male and 17 female characteristics and student health service usage at Northern Illinois University. The 408 students randomly selected were predominantly from a moderately educated middle-class background. Student characteristics were divided into 4 groups: personal-social, high school activities, academic experience, and health experience. Results of chi-square tests indicate significant relationships for males between 1 or more health service visits per semester and 6 personal-social characteristics. For females, significant relationships were found between health service usage and 4 personal-social characteristics and 3 health experience characteristics. The high proportion of significant personal-social factors for both sexes suggests that health service usage is socially and culturally learned behavior. Recommendations are made for campus medical staffs.—*F. Beyer*.

10573. Winer, Jerome A.; Dinello, Frank A.; Pasca, Alyce & Weingarten, Samuel. (U Chicago, Student Mental Health Clinic) **Innovations at university mental health services.** *Journal of the American College Health Association*, 1974(Apr), Vol 22(4), 281-283.—Describes innovative techniques at 39 university-based mental health facilities in Illinois. The number and variety of

innovations were reported by clinic directors and subjected to a panel of 3 judges. Facilities were divided into 10 medical-psychiatric centers, 14 counseling centers, and 15 others. Data indicate that 79% of the counseling centers had innovations as compared to 44% of the medical-psychiatric and other facilities combined. Reported innovations were divided into 10 categories and comparisons were made between services currently offered, services desired but not offered, and services discontinued. The importance of adapting mental health services to student needs is emphasized.—F. Beyer.

10574. Wolff, Thomas. (U Massachusetts, Amherst) **Helping students change the campus.** *Personnel & Guidance Journal*, 1974(Apr), Vol 52(8), 552-556.—Focuses on issues and expectancies in programs designed to help college students change the academic and living environment on their campuses; specifically, programs and their resultant issues as they developed at the University of Massachusetts at Amherst in activities run by the university health service. The 4 programs involved (a) training health consumers, (b) training social change agents, (c) working with a group of discontented veterans, and (d) working with a group of discontented paraprofessionals. Each program is discussed in detail, and the influence of the programs on the entire university population is reported.—J. F. McIlvaine.

## APPLIED PSYCHOLOGY

10575. Belanger, P. et al. (McGill U, Montreal, Quebec, Canada) **System simulation: On the modeling of large-scale health care systems.** *Behavioral Science*, 1974(Nov), Vol 19(6), 407-414.—Suggests that mathematical modeling of the system elements' functional properties allows the generation of a macromodel involving the flows of demands and resources, which can be useful for planning purposes over a time span of 5-10 yrs. Computer simulation runs can quickly compare many different strategies for their effect on system performance provided that adequate data are available on the unit cost distributions and effectiveness. The choice of flow parameters is discussed in addition to the difficult problems of resource allocation and appropriate measures of system performance.—*Journal abstract*.

10576. Johnson, Edgar M. **The effect of data source reliability on intuitive inference.** *US Army Research Institute for the Behavioral & Social Sciences, Technical Paper*, 1974(Jul), No 251, 26 p.—Presented military intelligence reports from data sources of given reliability and diagnosticity to 22 US Army enlisted men in a series of 2 hypothesis-decision problems. Each problem required the S to indicate the most likely of 2 hypotheses and to state the subjective odds. Results indicate that the subjective odds varied as a function of data diagnosticity and source reliability. Subjective odds were generally conservative when compared with the Bayesian model, with the exception that as reliability decreased subjective odds increased. Ss tended to use nonoptimal inference strategies with reliabilities as multiplicative weighting factors. Findings suggest several techniques for improving inferences based upon unreliable data. (19 ref)—A. J. Drucker.

10577. Katz, Fred E. (Tel-Aviv U, Israel) **Indeterminacy in the structure of systems.** *Behavioral Science*, 1974(Nov), Vol 19(6), 394-403.—Discusses theory of systems by concentrating directly on indeterminacy. It is suggested that indeterminacy, when bounded by limits, can be regarded as a definite component part of the structure of systems.

10578. Lipscomb, David M. (U Tennessee) **Noise: The unwanted sounds.** Chicago, IL: Nelson-Hall, 1974. 331 p. \$15.—Presents a comprehensive discussion of the types, effects, and characteristics of noise. Topics include sound, sound measurement, human responses to sound, structure and function of the ear, noise-induced stress, recreational noise, and noise control.

10579. Morse, E. V. & Gordon, G. (Tulane U) **Cognitive skills: A determinant of scientists' local-cosmopolitan orientation.** *Academy of Management Journal*, 1974(Dec), Vol 17(4), 709-723.—Studied differences in work orientations of a group of chemical scientists, all of whom held similar positions in a single organization. Data were gathered in 1965 and 1968 using S. Mednick's Remote Associates Test, a social differentiation test, and D. C. Pelz and F. M. Andrews's "style of approach to work" questionnaire. A factor analysis of Remote Associates Test scores yielded 4 categories of researchers (integrator, problem solver, problem recognizer, and technician) which were used to classify data. Findings support the argument that the cognitive skills which enable a scientist to identify and solve problems interact with the social dimensions of his work setting so as to increase the probability of his becoming either cosmopolitan or local in his orientation, and emphasize the importance of considering individual differences in social behavior rather than solely emphasizing the importance of structural determinants in a situation. (19 ref)—L. Gorsey.

10580. Quinn, Robert P. & Shepard, Linda J. (U Michigan, Inst for Social Research, Survey Research Ctr) **The 1972-73 quality of employment survey: Descriptive statistics, with comparison data from the 1969-70 survey of working conditions.** Ann Arbor, MI: University of Michigan, Institute for Social Research, 1974. 328 p.—Presents detailed data from personal interviews conducted with 1,496 persons to investigate variables associated with the quality of employment in the US. Topics include overall physical health, job satisfaction and motivation, comparisons among labor standard problem areas, working hours, discrimination, and the meaning of work.

10581. Somers, Gerald G. (Ed.). **Industrial Relations Research Association series: Proceedings of the twenty-sixth annual winter meeting, December 28-29, 1973, New York.** Champaign, IL: R. F. Colwell, 1974. xii, 293 p. \$6.50.—Presents a collection of theoretical and discussion papers on various aspects of industrial relations, including industrial democracy and the role of management, employee attitudes, job enrichment, and the work ethic, human capital theory, and growth in labor organizations.

10582. Weick, Karl E. (Cornell U) **Middle range theories of social systems.** *Behavioral Science*, 1974(Nov), Vol 19(6), 357-367.—Argues that several analytical biases provide false positive evidence support-

ing systems theory. False positives are likely when nouns exceed verbs in theoretical language, the analogy of thermostats is used indiscriminately, phenomenology of causation is ignored, need-specific interdependencies are neglected, organizational routines are mistaken for feedback systems, and when a more coarse-grained analysis is done of effects than of origins. Awareness of biases favoring false positives should result in interdependence being treated as a variable rather than a constant and to specification of conditions under which systems theory does and does not apply. With these changes, social systems theory would become a discrete confirmed theory that applies to limited ranges of data, consolidates segregated hypotheses, and is itself available for consolidation with other apparently discrete theories. (21 ref)—*Journal abstract*.

10583. Youngling, Edward W.; Vecchiotti, Robert A.; Bedarf, Erwin W. & Root, Robert T. (McDonnell Douglas, St Louis, MO) **Job requirements of G2 air and image interpretation personnel.** *US Army Research Institute for the Behavioral & Social Sciences, Research Report*, 1974(May), No 1181, 81 p.—Reviewed the literature, conducted interviews, and analyzed questionnaires mailed to US Army aerial reconnaissance and surveillance system (AR&S) personnel to determine the tasks, duties, and procedures of G2 Air and image-interpretation personnel. Data were integrated within the framework of the Army Air intelligence system by using system flow diagrams and task analyses. The role of G2 Air officers was found to be primarily managerial, while the image interpreter's job tended to be more technically oriented. Suggestions for future training needs are provided.—*A. J. Drucker*.

#### Occupational Guidance & Personnel Selection & Training

10584. Akman, Allan & Nordhauser, Fred. (System Automation Corp, Silver Spring, MD) **A conceptual view of the Officer Procurement Model (TOPOPS).** *US AFHRL Technical Report*, 1974(Jul), No 73-73, 44 p.—Documents the conceptual design of a computer-based linear programming model of the Air Force officer procurement system called TOPOPS (Total Objective Plan for the Officer Procurement System). The principal features of the model are highlighted, a detailed description of the framework used in developing it is presented, and the mathematical model is described. An appendix presents sample input and output reports.—*Journal abstract*.

10585. Barad, Cary B.; Lawrence, Richard E. & Krieger, George W. (Social Security Administration, Baltimore, MD) **Role conflict and consensus in vocational evaluation.** *Vocational Evaluation & Work Adjustment Bulletin*, 1974(Jun), Vol 7(2), 20-26.—Gathered questionnaire data from 462 vocational evaluation and rehabilitation counseling professionals regarding potential sources of role conflict and consensus in vocational evaluation. For 5 of the 8 dimensions examined role consensus appeared to exist. Both vocational evaluators and other relevant professionals placed equal emphasis on the psychometrist, assessor, instructor, co-worker, and case coordinator aspects of the vocational evaluators' roles. The validity of the remaining 3 dimensions

(foreman, vocational counselor, and psychologist-case-worker) was agreed on by vocational evaluators and their impinging supervisors, but was a source of conflict for affiliated professionals outside the immediate field. (20 ref)—*A. de la Haba*.

10586. Fletcher, Frank M. et al. (Ohio State U) **The delivery of manpower and supportive services to rural areas.** *Journal of Employment Counseling*, 1974(Dec), Vol 11(4), 167-174.—Identifies problems encountered by state employment service agencies and other organizations in the delivery of manpower and supportive services to rural and migrant workers. A midwest field trip to agencies and organizations suggests that the delivery of services commensurate with those given in urban centers is feasible. Conditions and minimal services necessary for a rural employment office to operate effectively are outlined, and programs for extremely isolated areas are proposed. Ways are seen for assisting migrant Mexican-American workers to settle in rural communities. It is considered that the cost per placement of Mexican-Americans would be generally high and the cost per placement for the general rural population would be similar to that in urban offices, but the long-range benefits outstrip the costs. A formal comprehensive study by the Manpower Administration, covering 15-20 rural areas, is recommended.—*P. O'Brien*.

10587. Harwood, Richard K. (U Virginia) **Educating, rather than coaching, for the job interview.** *Journal of Employment Counseling*, 1974(Dec), Vol 11(4), 187-190.—Considers that, in order for students to successfully secure employment, placement counselors need to regard the total job campaign as an educational process. The process begins by accepting students as they are, helping them to identify and clarify their career strengths, weaknesses, and goals, and identifying and contacting prospective employers. It is, theoretically, a never-ending process in which the actual employment interview is a small, but important facet.—*Journal abstract*.

10588. Jukl, Eduard. (Vysoká škola strojí a elektrotechniká, Plzeň, Czechoslovakia) **[The problem of prognostication and planning the development of professional categories: Developmental tendencies of the engineering profession.]** (Czec) *Sociologický Časopis*, 1974, Vol 10(1), 68-78.—Theorizes about the potential contribution of sociology to the development and planning of trades and professions. Research findings in Czechoslovakia and elsewhere concerning the engineering profession are presented and analyzed. A discrepancy between the growing requirement of technical development and the unsatisfactory intellectual level of students at the Technical College in Plzeň is found. (Russian & English summaries) (30 ref)—*V. Fischmann*.

10589. Leung, Paul. (U Arizona, Coll of Education) **The use of behavior contracts in employability development planning.** *Journal of Employment Counseling*, 1974(Dec), Vol 11(4), 150-153.—Suggests the counseling procedure of the behavior contract for the enhancement of the employability development plan. Some of the difficulties associated with the use of employability development planning, such as lack of motivation for completion, can be dealt with successfully by incorporation of a behavioral contract. Specific behaviors and

responsibilities are defined and appropriate reinforcements are applied in a combined approach. Although this type of planning may require some examination of the 2 processes for full use within a manpower program, the end result appears to be a more effective use of manpower programs.—*Journal abstract.*

10590. Loomis, Rosemary & Starry, Richard. (Employment Security Div, Work Incentive Program, Green Bay, WI) **Rural WIN-ings.** *Journal of Employment Counseling*, 1974(Dec), Vol 11(4), 183-186.—Explores the experiences of 2 Work Incentive Program (WIN) staff members in delivering employment-related services in a rural WIN program. 3 prevalent rural obstacles to employment are dealt with: transportation, flexibility with individual cases, and sex barriers. The theory that rural areas offer few employment possibilities for WIN clients is disputed, and it is pointed out that, with flexibility and creativity, rural areas are productive in helping WIN clients become self-supporting.—*Journal abstract.*

10591. Nigro, Felix A. & Nigro, Lloyd G. (U Georgia) **The trainer as a strategist.** *Public Personnel Management*, 1974(May-Jun), Vol 3(3), 193-198.—Identifies 3 basic dimensions in the task of developing and instituting training programs: (a) identification and analysis of technical or social-psychological intervening variables; (b) strategy of decisions about training goals and means; and (c) program design, execution, and evaluation. Discussion is focused on the 2nd aspect. It is concluded that capable trainers are contextual strategists and that they strive to minimize uncertainty.—*S. E. Bowser.*

10592. Olmstead, Joseph A.; Cleary, Fred K.; Lackey, Larry L. & Salter, James A. (Human Resources Research Organization, Alexandria, VA) **Development of leadership assessment simulations.** *US Army Research Institute for the Behavioral & Social Sciences, Technical Paper*, 1974(Oct), No 257, 34 p.—Describes a project designed to develop leadership assessment simulations for use in US Army assessment centers. Simulations and associated procedures were developed to assess 3 levels of military personnel on 11 leadership dimensions as well as materials and procedures for training staff personnel to conduct the simulations and employ the assessment instruments. It is concluded that organizational simulations contribute to assessment programs in a manner that is not obtainable through other techniques.—*A. J. Drucker.*

10593. Orpen, Christopher. (U Cape Town, South Africa) **The "correct" use of personality tests: A view from industrial psychology.** *Public Personnel Management*, 1974(May-Jun), Vol 3(3), 228-229.—Notes several areas of agreement about personality tests among industrial psychologists: (a) A test whose validity is dubious cannot be accepted. (b) Assessments of clinical nature or application are unwarranted invasions of privacy. (c) A test must be demonstrated to be related to effectiveness at work. (d) Test norms must be relevant to person tested.—*S. E. Bowser.*

10594. Pate, Robert H. & Harwood, Richard K. (U Virginia) **Employment interviews: How critical.** *Journal of Employment Counseling*, 1974(Dec), Vol 11(4), 176-182.—Analyzed interview ratings of job applicants to determine the relationship between selected character-

istics and behaviors of applicants and the outcome of their interviews. Ss were 398 registrants of a university placement office who were evaluated in 1,894 interviews with 234 organizations. Findings indicate that, despite suggestions in placement literature which focus on specific aspects of the interview, applicants' actual interview behavior is evaluated on 1 dimension, and their paper credentials are evaluated on another. Results suggest that part of the cause of dispositions of employment interview results comes from candidates' interview behaviors and part comes from as yet unexplained sources. It is recommended that both job applicants and placement counselors question the validity of stereotypes of college interviews presented in the literature.—*Journal abstract.*

10595. Rivers, P. Clayton; Sarata, B. P. & Book, Thomas. (U Nebraska, Alcohol Training Program, Lincoln) **Effect of an alcoholism workshop on attitudes, job satisfaction and job performance of secretaries.** *Quarterly Journal of Studies on Alcohol*, 1974(Dec), Vol 35(4), 1382-1388.—Conducted a workshop to improve the handling of alcoholics and referrals by secretaries of agencies concerned with alcohol-related problems. 2 4-hr sessions, attended by 25 secretaries from 12 agencies, gave basic information about alcohol, the problems involved in handling alcoholics, and the functions of local agencies dealing with alcohol problems. After the workshop the employees expressed greater satisfaction about working in the field of alcoholism. Of the 18 secretaries for whom complete data were available, 12 had higher scores on a factual knowledge quiz after the workshop, 16 said the workshop helped them in dealing with other agencies and 13 in relating to alcoholics. It is concluded that the workshop increased satisfaction with employment in the field of alcoholism and increased the secretaries' ability to handle extra-agency contacts.—*Journal abstract.*

10596. Spangenberg, Ronald W. (US Air Force Human Resources Lab, Media Design & Evaluation Branch, Lowry Air Force Base, CO) **The motion variable in procedural learning.** *HumRRO Professional Paper*, 1974(Sep), No 14-74, 16 p.—Studied the effects of motion in instructional presentations. 40 Army enlisted men in their 6th wk of basic training were exposed to a motion film sequence and a still film sequence of 2 different operations involving the disassembly of an M85 machine gun, first when cued by a short demonstration, and second without cues. Ss were required to complete the disassembly task under both conditions. Findings indicate that the use of motion in display is indicated when the material to be learned consists of movement itself, or where the content is enhanced and differentiated by the cues provided. Motion did not appear to be a factor in learning procedural sequence of steps. The use of animation arrows to direct attention and to show the direction of motion did not help learning. (20 ref)—*A. de la Haba.*

10597. Ward, Joe H. & Haltman, Harry P. (US Air Force Human Resources Lab, Brooks Air Force Base, TX) **Computer-based enlistment quota reservation system using the general data management system 2000.** *US AFHRL Technical Report*, 1974(Aug), No 74-62, 25 p.—Describes the capabilities of a system

designed as a feasibility demonstration for US Air Force Recruiting Service staff. Operational commands are described which allow a user to search the data base to locate enlistment openings for which applicants might be eligible. A user can also reserve an enlistment opening when the applicant is ready to accept a position. Management can use commands that summarize openings and enlistments by Air Force Specialty Code, aptitude area, and other categories.—*Journal abstract.*

10598. Zacker, Joseph. (City Coll, City U New York) **Is opposition to social intervention resistance or coping?** *Professional Psychology*, 1974(May), Vol 5(2), 198-205.—Reports on an unexpectedly high level of initial resistance encountered in training sessions designed to reorient police officers from traditional operations to a community-oriented, neighborhood police (Team) strategy. One week training sessions were run during 4 consecutive weeks, and each session involved groups of about 32 police officers. Methods such as discussion groups, practice interventions, and simulated community meeting workshops were used to promote active decision making and interdependence among Team members. The function of the staff psychologists was to facilitate participatory learning about Team operations. A high level of initial resistance was manifest in an intense and openly expressed hostility. In all 4 groups there was a marked diminution in the opposition between the end of Day 2 and the start of Day 4, and the remainder of the training was marked by a high degree of cooperation and involvement. The psychoanalytic theory of resistance is rejected as an adequate explanation of what occurred during training. It is proposed, instead, that the opposition represented an effort to constructively increase integrity by resisting manipulation.—*B. Lindsey.*

### Job Performance & Satisfaction

10599. Feuille, Peter & Blandin, James. (State U New York, Buffalo) **Faculty job satisfaction and bargaining sentiments: A case study.** *Academy of Management Journal*, 1974(Dec), Vol 17(4), 678-692.—A survey of 454 faculty members shows that faculty demographic and job satisfaction measures were related to perceptions of and sentiments toward collective bargaining at 1 institution which is unorganized but which has experienced substantial resource scarcities. A heavy majority of the respondents favored collective bargaining. This support was strongly correlated with expressed dissatisfaction and several demographic variables. (16 ref)—*Journal abstract.*

10600. Kalleberg, Arne L. (U Wisconsin, Madison) **A causal approach to the measurement of job satisfaction.** *Social Science Research*, 1974(Dec), Vol 3(4), 299-322.—Compared 4 commonly used measures of job satisfaction (2 single-item indicators and 2 scales—"is now" and "should be-is now") with respect to their relationship to 3 independent variables (education, occupational status, and income) in the context of a causal model that incorporates considerations of measurement error in both independent and dependent variables. Data from a previous study of 656 male office and factory workers were used. It was found that, in some cases, different indicators imply different conclusions regarding the

influence of education and occupational status on job satisfaction. The utility of a causal modeling approach to these problems is discussed. Direct and other work indicators were found to be invalid in that they produced relatively large underestimations of the effects of occupational status when compared to the 2 scales, which produced essentially the same results. (43 ref)—*Journal abstract.*

10601. Leamon, T. B. (Inst of Technology, Industrial Ergonomics Section, Cranfield, England) **An investigation into the effects of knowledge of results on operator performance.** *Ergonomics*, 1974(Sep), Vol 17(5), 639-650.—The effect of knowledge of results (KR) on the performance of 7 female operators engaged on repetitive hand work in industry was investigated over a 40-day period. Significant increases in performance were observed in the Ss during the 20-day KR period compared to the 10-day baseline, as well as significant increases in post-KR compared to KR periods. The relationship of these findings to earlier conflicting studies is discussed in terms of 2 mechanisms, the 1st utilizing information to alter and maintain the work pace and the 2nd utilizing the feedback to motivate the Ss to alter their paces. (French & German summaries)—*Journal abstract.*

10602. Lyon, Herbert L. & Ivancevich, John M. (U Kentucky, Coll of Business & Economics) **An exploratory investigation of organizational climate and job satisfaction in a hospital.** *Academy of Management Journal*, 1974(Dec), Vol 17(4), 635-648.—Studied organizational climate and its impact on job satisfaction in a university teaching hospital. 35 nurses and 99 administrators completed a questionnaire derived from the Halpin and Crofts Organizational Climate Description Questionnaire, a 9-item measure of job satisfaction, and interviews which were held before and after the administration of the questionnaires. Results indicate that different climate dimensions influence individual job satisfaction facets and that the impact of organizational climate on satisfaction varies with the climate dimension and type of satisfaction. Some climate dimensions had no impact at all on the satisfaction facets. In general, organizational climate for both occupational groups had the most significant impact on self-actualization, a lesser impact on autonomy, and only a slight impact on esteem. (36 ref)—*L. Gorsey.*

10603. Sielaff, Theodore J. (San Jose State U) **Modification of work behavior.** *Personnel Journal*, 1974(Jul), Vol 53(7), 513-517.—Describes the results of various attempts to improve the work performance of 22-yr-old employees. After they chose a piece rate system with earnings based on units of work completed, production increased dramatically.

10604. Strauss, George. (U California, Berkeley) **Job satisfaction, motivation, and job redesign.** In G. Strauss, R. E. Miles, C. C. Snow & A. S. Tannenbaum (Eds), *Organizational behavior: Research and issues*. Madison, WI: Industrial Relations Research Assn, 1974. iv, 236 p. \$6.

10605. Strauss, George; Miles, Raymond E.; Snow, Charles C. & Tannenbaum, Arnold S. (Eds.). (U California, Berkeley) **Organizational behavior: Research and issues.** Madison, WI: Industrial Relations Research Assn, 1974. iv, 236 p. \$6.—Includes 8 chapters that focus

on various aspects of organizational behavior, including the problem of alienation among workers, methods of involving workers in management problems, conflict and conflict resolution, and organizational development.

10606. Szilagyi, Andrew D. & Sims, Henry P. (U Houston) **An exploration of the path-goal theory of leadership in a health care environment.** *Academy of Management Journal*, 1974(Dec), Vol 17(4), 622-634.—Studied relationships between leader behavior and subordinate satisfaction and performance, unmoderated and moderated by a subordinate's role ambiguity, at multiple occupational skill levels in a hospital. Data were obtained by questionnaire (e.g., Job Descriptive Index) from 53 administrative, 240 professional, 117 technical, and 231 service personnel. Results support path-goal theory's propositions concerning the relationship between leader initiating structure and subordinate satisfaction, but not leader initiating structure and subordinate performance. (37 ref)—*Journal summary*.

### Management & Leadership

10607. Alderfer, Clayton P.; Kaplan, Robert E. & Smith, Ken K. (Yale U, School of Organizations & Management) **The effect of variations in relatedness need satisfaction on relatedness desires.** *Administrative Science Quarterly*, 1974(Dec), Vol 19(4), 507-532.—Conducted a study of 21 male middle and upper-middle managers to test hypotheses on relatedness satisfactions and desires; these hypotheses were derived from existence, relatedness, and growth (ERG) theory. Ss participated in role-playing activities based on their descriptions of actual work experiences. 3 degrees of mutuality and relatedness satisfaction were created in the role-playing experiment. Ss' desires for relatedness varied as a function of the experimental conditions and support the hypothesized curvilinear relationship between relatedness satisfaction and desires. Results were consistent with previous results obtained by field correlational methods and thus provide a link between the 2 methodologies for the study of human needs in organizational settings. A new behavior coding system is presented for scoring mutuality in interpersonal behavior and suggests that high degrees of relatedness satisfaction can be produced in a laboratory setting. (20 ref)—*Journal abstract*.

10608. Dunahee, Michael H. & Wangler, Lawrence A. (Bank of A Levy, Oxnard, CA) **The psychological contract: A conceptual structure for management/employee relations.** *Personnel Journal*, 1974(Jul), Vol 53(7), 518-526, 548.—Describes various characteristics of the unwritten contract between an employer and his employees. The employment relationship is discussed in terms of the refinement of mutual expectations that evolve during the lifetime of the contract. Thus, management functions to maintain a workable contract with each employee by (a) clearly structuring job responsibilities, (b) maintaining continuous feedback between the 2 parties, (c) emphasizing the man and the job as a total system, and (d) correlating compensation with terms of the psychological contract.—*P. L. Crawford*.

10609. Helme, William H.; Willemin, Louis P. & Grafton, Frances C. **Prediction of officer behavior in a simulated combat situation.** *US Army Research Institute*

*for the Behavioral & Social Sciences, Research Report*, 1974(Mar), No 1182, 55 p.—Of 4,000 US Army officers who took the experimental Differential Officer Battery (DOB) at entry on active duty, 900 went through a 3-day Officer Evaluation Center (OEC) simulation exercise 1-2 yrs later, performing 5 technical, 5 administrative, and 5 combat-type tasks. Successive factor analyses of OEC data yielded 30 task-specific factors and 8 major behavioral dimensions, the 2 most important being Combat Leadership and Technical-Managerial Leadership. Parallel DOB factor analyses produced 92 psychological factor scale scores and 17 major factorial dimensions of officer characteristics for validation against OEC performance. In relating major dimensions (17 DOB to 8 OEC), OEC Combat Leadership was well predicted only by the DOB Combat Leadership factor. OEC Technical-Managerial Leadership was best predicted by the DOB Scientific Potential and General Knowledge factors, which also predicted OEC Technical Staff and Tactical Staff Skills, though Technical Skills were best predicted by DOB Mechanical Technology, which did not predict other OEC dimensions.—*A. J. Drucker*.

10610. Ivancevich, John M. (U Houston) **Changes in performance in a management by objectives program.** *Administrative Science Quarterly*, 1974(Dec), Vol 19(4), 563-574.—Conducted a longitudinal study of performance in a manufacturing company using management by objectives (MBO); a multiple-time-series quasi-experimental research design was utilized. The performance of the subordinates of 181 MBO-involved supervisors in production and marketing departments is analyzed, as well as time lag, reinforcement, and sustaining improvements in performance. (33 ref)—*Journal abstract*.

10611. Kearney, William J. & Martin, Desmond D. (U Cincinnati) **Sensitivity training: An established management development tool?** *Academy of Management Journal*, 1974(Dec), Vol 17(4), 755-760.—Surveyed 225 personnel and training directors in large manufacturing firms about the effectiveness of commonly used management development instruments (e.g., game theory, T groups, role-playing, and in-basket techniques). On-the-job experiences and job transfer were perceived as being clearly more effective than any other instrument. Sensitivity training ranked lowest among the named techniques. 109 respondents (48.4%) stated that they do not set aside any portion of their management development program for sensitivity training. 78 respondents (70%) did not think that the use of sensitivity training in management programs would increase over the next 5 yrs. It is concluded that sensitivity training does not fill an important role in management development since it may be viewed as inappropriate for existing organizational goals or less effective than other techniques.—*L. Gorsey*.

10612. Leidecker, Joel K. & Hall, James L. (U Santa Clara) **The impact of management development programs on attitude formation.** *Personnel Journal*, 1974(Jul), Vol 53(7), 507-512.—Describes the results and implications of a management development program at the University of Santa Clara. Research instruments were the Public Opinion Questionnaire and the Profile of Organizational Characteristics.

10613. Price, Barbara R. (Pennsylvania State U, Law Enforcement & Corrections Services) **A study of leadership strength of female police executives.** *Journal of Police Science & Administration*, 1974(Jun), Vol 2(2), 219-226.—Measured leadership traits of both sexes at all ranks in 3 municipal police departments. The Dynamic Personality Inventory was administered to 26 women and 227 men at the rank of sergeant or above. Of 11 subscales directly associated with leadership, maturity, and self confidence, 6 showed sex differences, all but one in favor of women. It is concluded that women police executives showed more leadership potential than their male counterparts. Interdepartmental and intercity analyses of the data were not conducted due to sample size restrictions.—R. J. Albers.

10614. Ritchie, J. B. (Brigham Young U) **Supervision.** In G. Strauss, R. E. Miles, C. C. Snow & A. S. Tannenbaum (Eds), *Organizational behavior: Research and issues*. Madison, WI: Industrial Relations Research Assn, 1974. iv, 236 p. \$6.—Examines some conceptual and methodological issues associated with the study of supervision. Supervisory style, attitudes, and policy questions are discussed.

10615. Robins, James E.; Buffardi, Louis & Ryan, Thomas G. (Bunker-Ramo Corp, Arlington, VA) **Research on tactical military decision making: Application of a decision prediction concept in a SIMTOS environment.** *US Army Research Institute for the Behavioral & Social Sciences, Technical Paper*, 1974(Mar), No 246, 53 p.—Experimentally investigated 9 potential predictors of decision quality in a test military scenario for division defensive planning. 20 US Army senior field grade officers, utilizing a fully computerized information retrieval facility (SIMTOS), participated in the experiment. Results indicate that 4 of the 9 predictors maintained substantial predictive stability in the present SIMTOS environment: (a) recency of attendance at the Command and General Staff College (CGSC), (b) CGSC class standing, (c) information request slope—the number of information requests made by the officer early in the decision-making process in relation to decision quality, and (d) terminal pause—the time between final information request and decision.—A. J. Drucker.

10616. Tannenbaum, Arnold S. (U Michigan) **Systems of formal participation.** In G. Strauss, R. E. Miles, C. C. Snow & A. S. Tannenbaum (Eds), *Organizational behavior: Research and issues*. Madison, WI: Industrial Relations Research Assn, 1974. iv, 236 p. \$6.—Explores the relationship between participation and control. 4 major groups of formal workers' participation are discussed: legal systems, collective bargaining, consultative schemes, and behavioral science approaches. Conditions under which participation is most likely to be effective are discussed.

10617. Vujtěch, Jan. [Problem of style of management of a work group.] (Czech) *Syntéza*, 1972, (Apr), Vol 5(2), 58-66.—To determine the relationship of leadership styles to workers' preferences and leaders' effectiveness, a questionnaire measuring authoritarian, democratic, liberal (laissez-faire), and motivational leadership styles was administered to 236 employees (91 returns) of a foreign-trade government office, who worked in groups of 3 to 12. Managers were also judged by 2 independent

superiors as successful or less successful. Successful managers were more authoritarian and less democratic than less successful managers; their styles were less congruent with the style desired by their subordinates; and motivational styles characterized good human relationships. Workers with elementary school education preferred democratic leadership while workers from high school and college levels preferred motivational leadership. Administrators expressed preference for democratic and authoritarian styles while leaders expressed preference for motivational style. Unsuccessfully led employees expressed more satisfaction with their leader's style than successfully led ones. No differences were found in preferences between men and women nor older and younger workers. The laissez-faire style was rejected by all respondents. A warning is expressed about generalizing from this study. (English, German, French, & Russian summaries)—P. Babarik.

### Organizational Structure & Climate

10618. Brown, L. Dave; Aram, John D. & Bachner, David J. (Case Western Reserve U) **Interorganizational information sharing: A successful intervention that failed.** *Journal of Applied Behavioral Science*, 1974(Oct-Dec), Vol 10(4), 533-554.—Examines an interorganizational intervention conducted in a consortium of 7 schools of theology for evidence of intervention effects and for clues to the complexities of the 3rd-party role. Although the data support the hypothesis that the intervention would increase the amount and accuracy of the information shared by participant organizations, the expected increases in organizational consensus and decreases in interorganizational problems of coordination failed to materialize. Some implications of these findings are discussed, and some hypotheses about the role of 3rd parties in interorganizational interventions are generated.—*Journal abstract*.

10619. Golembiewski, Robert T.; Hilles, Rick & Kagno, Munro S. (U Georgia) **A longitudinal study of Flexi-Time effects: Some consequences of an OD structural intervention.** *Journal of Applied Behavioral Science*, 1974(Oct-Dec), Vol 10(4), 503-532.—Describes the implementation of a flexible work-hours program and analyzes its major effects, using both attitudinal and hard data. Specific outcomes of this version of a model that is currently being widely applied are discussed, though typically on the basis of anecdotal evidence and without the support of organizational development (OD) values and methods. Both the hard and the soft data indicate that the structural intervention worked but do not indicate how much of its impact was the result of the intervention as a technique and how much was a function of the culture of the host organization. It is believed that much of that impact derived from client acceptance of OD values, which found expression not only in the work-hours design itself but also in the dynamics of the implementation of that design. It is concluded that Flexi-Time installations are intimately affected by the culture and values of organizations in which they are located.—*Journal abstract*.

10620. Hrebiniak, Lawrence G. (Pennsylvania State U) **Effects of job level and participation on employee attitudes and perceptions of influence.** *Academy of*

*Management Journal*, 1974(Dec), Vol 17(4), 649-662.

—Studied the relative impact of perceived deficiency in decision making and job level on 46 general hospital mental health workers' perceptions of desired influence and 3 work-related attitudes—interpersonal trust, role tension, and commitment to the organization. All Ss completed questionnaires assessing participation in decision-making interpersonal trust, role tension, and perceptions of desired influence. Results show that (a) technological level or level of task sophistication was not strongly related to perceived deprivation in decision making, (b) job level and decisional deprivation had independent and different effects on the attitudinal and influence variables, (c) perceived deficiencies in participation were more important than level when considering desired alterations in the influence or control structure of the task unit, and (d) perceived deficiency had little impact on work related attitudes (e.g., trust and commitment). (34 ref)—*L. Gorsey*.

10621. **Kahn, Robert L.** (U Michigan) **Organizational development: Some problems and proposals.** *Journal of Applied Behavioral Science*, 1974(Oct-Dec), Vol 10(4), 485-502.—Reviews the organizational development (OD) literature, revealing that (a) much of its research is redundant and without refinement or validation, (b) the term "organizational development" itself remains scientifically undefined and primarily a convenient label for a variety of activities, and (c) the OD literature as a whole is more autobiographical than organizational in focus and scope. It is suggested that work toward resolution of these 3 problems would help the practice of OD base itself on a more mature and usable set of principles and procedures for organizational change. The adequacy and utility of the traditional dichotomy between organizational process and structure evident in the literature are questioned, and a reconceptualization of organizational structure that permits clarification of key issues in the practice and theory of organizational change is discussed. (55 ref)—*Journal abstract*.

10622. **Kroes, William H.; Margolis, Bruce L. & Hurrell, Joseph J.** **Job stress in policemen.** *Journal of Police Science & Administration*, 1974(Jun), Vol 2(2), 145-155.—Studied the factors in occupational stress experienced by policemen. Interviews were conducted with 100 male members of the Cincinnati police department involved with car patrol. Data collected included background information, perceptions of job stress, and health status. Replies to interview questions show that the most important stressors were (a) problems with administration (e.g., work assignments); (b) problems with the courts (excessive leniency); (c) community relations (e.g., negative public reactions); and (d) inadequate or defective equipment. Direct life-threatening stressors were less frequently mentioned.—*R. J. Albers*.

10623. **Miles, Raymond E.** (U California, Berkeley) **Organization development.** In G. Strauss, R. E. Miles, C. Snow & A. S. Tannenbaum (Eds), *Organizational behavior: Research and issues*. Madison, WI: Industrial Relations Research Assn, 1974. iv, 236 p. \$6.

10624. **Nightingale, Donald.** (Queen's U, Kingston, Ontario, Canada) **Conflict and conflict resolution.** In G. Strauss, R. E. Miles, C. C. Snow & A. S. Tannenbaum

(Eds), *Organizational behavior: Research and issues*. Madison, WI: Industrial Relations Research Assn, 1974. iv, 236 p. \$6.

10625. **Nord, Walter R.** (Washington U, Graduate School of Business) **The failure of current applied behavioral science: A Marxian perspective.** *Journal of Applied Behavioral Science*, 1974(Oct-Dec), Vol 10(4), 557-578.—Argues that Marx's writings allow the objectives, approach, and practice of applied behavioral science to be analyzed in the context of the prevailing socioeconomic system. It is contended that this system reveals latent forces which may be responsible for the failure of applied behavioral science to humanize modern organizations. J. A. Lee's (1971) modern human resources management (MHRM) paradigm and the works of MHRM theorists are discussed, and the MHRM paradigm is compared with Marx's analyses of goals for mankind, human development, work, alienation, and the progress of social change. It is contended that the assumptions and limited scope of MHRM writers are partially responsible for the failure of organizational change agents to fully achieve their goals. The Marxian approach, it is held, points to the symbiotic relationship between the MHRM paradigm and capitalistic ideology and encourages exploration of alternative power bases for humanistically oriented change. (60 ref)—*B. McLean*.

10626. **Ouchi, William G. & Harris, Reuben T.** (Stanford U) **Structure, technology, and environment.** In G. Strauss, R. E. Miles, C. C. Snow & A. S. Tannenbaum (Eds), *Organizational behavior: Research and issues*. Madison, WI: Industrial Relations Research Assn, 1974. iv, 236 p. \$6.—Explores H. Leavitt's (1972) theory that organizations behave in ways above and beyond the individual action of its members. A review of the literature is presented on the ways in which organizations are subject to external forces in the environment and to the demands of technology.

10627. **Perlaki, Ivan.** (Československý výzkumný ústav práce, Bratislava, Czechoslovakia) **[Influence of the structure of organization units on their innovational capacity.]** (Czec) *Sociologický časopis*, 1974, Vol 10(1), 55-67.—Deals with theoretical and practical problems of institutional management under the growing pressure of innovational changes. Effective functioning of an institution will depend on the adaptability of the structure and inner processes of its subsystems—the individual organization units. The effects of specialization, standardization, formalization, centralization, and configuration of units are discussed in detail but the need to evaluate innovational capacity of units in reference to the effective functioning of the institution as a whole is stressed. (Russian & English summaries) (66 ref)—*V. Fischmann*.

10628. **Reiser, Martin.** (Los Angeles Police Dept, CA) **Some organizational stresses on policemen.** *Journal of Police Science & Administration*, 1974(Jun), Vol 2(2), 156-159.—Examines the stresses on policemen arising from personal problems, the police organization, and the work environment.

10629. **Schröder, Marjan.** (Van de Bunt & Co BV, Amsterdam, Netherlands) **The shadow consultant.** *Journal of Applied Behavioral Science*, 1974(Oct-Dec),

Vol 10(4), 579-594.—Discusses the reciprocal responsibilities of the consultant and of the shadow consultant—a consultant who, at the request of a colleague and through a socioscientific approach in mutual discussions, evaluates the diagnosis, tactics, or role adopted in a certain assignment—and the possible pitfalls encountered by each in relation to the client.

10630. Strauss, George; Miles, Raymond E. & Snow, Charles C. (U California, Berkeley) **Implications for industrial relations.** In G. Strauss, R. E. Miles, C. C. Snow & A. S. Tannenbaum (Eds), *Organizational behavior: Research and issues*. Madison, WI: Industrial Relations Research Assn, 1974. iv, 236 p. \$6.

### Human Factors Engineering & Safety

10631. Breinbauer, W. & Höfner, K. J. [Der jugendliche Kraftfahrer: Untersuchung im Auftrag des Bundesministeriums für Gesundheit und Umweltschutz. (Youthful motorists: Investigation of the commission of the state ministry for health and environmental protection.).] (Germ) Wien, Austria: Verkehrspsychologisches Inst, Kuratorium für Verkehrssicherheit, 1974. 62 p.—Compared the types of accidents of various groups of persons according to age, sex, degree of intoxication, and seriousness of resultant injury. Data from 52,763 personal injury traffic accidents show that the age variable was dominant over the sex variable, although differences in the types of accidents characteristic of drivers in certain age groups disappeared when intoxicated drivers were considered. (4 p ref)

10632. Browning, A. C. (Royal Aircraft Establishment, Farnborough, England) **City transport of the future—the high speed pedestrian conveyor: I. Ergonomic considerations of accelerators, decelerators and transfer sections.** *Applied Ergonomics*, 1974(Dec), Vol 5(4), 225-321.—Reports results of laboratory experiments investigating ergonomic factors involved in using moving pavements as a form of passenger transport. Implications for passenger safety and comfort are discussed.

10633. Phanér, Gunilla & Hane, Monica. (U Göteborg, Sweden) **Seat belts: Contextual factors and bias of reported use.** *Journal of Safety Research*, 1974(Dec), Vol 6(4), 166-170.—Studied the effects of respondent's perception of interviewer's knowledge of actual seat belt use, survey sponsorship (e.g., by the government or a university), and interviewer sex on self-reports of seat belt use. None of the 3 factors affected self-reported belt use or attitudes.

10634. Gallagher, C. C. (U Strathclyde, Glasgow, Scotland) **The human use of numbering systems.** *Applied Ergonomics*, 1974(Dec), Vol 5(4), 219-223.—Considers the role of short-term memory in the design of numbering systems for both public and industrial use, with particular reference to the manipulation of numbers and letters. (17 ref)

10635. Hultgren, Gosta V.; Knave, Bengt & Werner, Maud. **Eye discomfort when reading microfilm in different enlargers.** *Applied Ergonomics*, 1974(Dec), Vol 5(4), 194-200.—At a large banking firm, the lighting conditions were studied under which 9 50-60 yr old female employees read microfilms in different enlargers. Complaints from the staff were analyzed and compared

with the results obtained. Discomfort glare due to heavy contrasts between the dark documents on the screens and other light surfaces in the visual fields was the main cause of the complaints. It was recommended that individual near-work spectacles might decrease or eliminate some of the disturbing factors which had led to the subjective complaints. Suggestions are made for improving the enlargers.—*Journal abstract*.

10636. Kogi, Kazutaka & Saito, Yoshio. (Railway Labour Science Research Inst, Tokyo, Japan) **Rhythmic fluctuation of orientation to a continuous manual control task.** *Journal of Human Ergology*, 1973(Dec), Vol 2(2), 169-184.—Fluctuation of orientation to a tracking task was made observable by varying the controlled system characteristics according to the error level of the moment. 6 male adult Ss in each of 2 experiments performed either compensatory or pursuit tracking for 15 min, and large error increases were seen between intervals of half a minute to a few minutes. In compensatory tracking, the S was to find, as quickly as possible, randomly appearing, flickering illumination of the target spot. The critical flicker frequency thus measured was significantly lower during 15-sec periods preceding error increases than during steady control phases, low values from the former periods deviating from a normal distribution. In pursuit tracking, saccadic eye movements were found less frequently during 15-sec periods prior to large error increases, resulting in lowered instantaneous saccade rates computed from distribution of saccade intervals. Results suggest that a recurrent phase exists in which orienting to the tracking temporarily declines prior to an apparent performance decrement, presumably due to spontaneous lapse of attention. (34 ref)—*Journal abstract*.

10637. Leplat, Par J. (Ecole Pratique des Hautes Etudes, Lab de Psychologie du Travail, Paris, France) **[Criteria in ergonomic studies of road safety.]** (Fren) *Ergonomics*, 1974(Sep), Vol 17(5), 663-675.—Considers, in the light of recent work, methodological problems posed by the definition of safety criteria and their relevance to ergonomic studies. Methods of categorizing accidents are discussed, and, because of the inadequacy of the term "accident," other definitions of safety are suggested which describe the same dysfunctioning of the system. The nature and validity of several broad categories of criteria are discussed (e.g., incidents, near-accidents, infraction of rules, and characteristics of the system). Possible improvements in the study of the nature of accidents and in preventive measures arising from the use of less broad criteria are considered. (German summary) (37 ref)—*English summary*.

10638. McBay, Arthur J.; Hudson, R. Page; Hamrick, Nancy & Beaubier, Jeff. (North Carolina Dept of Human Resources, Office of the Chief Medical Examiner, Raleigh) **Alcohol impairment in highway fatalities in North Carolina, 1972.** *Journal of Safety Research*, 1974(Dec), Vol 6(4), 177-181.

10639. Prentice, John W. (Ford Motor Co, Advanced Vehicles Product Planning Office, Dearborn, MI) **The evasive action decision in an intersection accident: A game theory approach.** *Journal of Safety Research*, 1974(Dec), Vol 6(4), 146-149.—Describes a procedure which uses matrices, derived from game theory, to

determine strategies that will avoid an accident or minimize the severity of the resulting crash. An example of an accident situation is presented.

10640. Rogne, Karl. (Work Research Inst, Oslo, Norway) **Redesigning the design process: Superstructures of ships.** *Applied Ergonomics*, 1974(Dec), Vol 5(4), 213-218.—Uses open-system theory to propose an alternative process for solving social and technological problems in ship design. Cooperative residential workshops for both office and seagoing staff to increase their awareness of social trends in ship environments are described.

10641. Routledge, D. A.; Repetto-Wright, R. & Howarth, C. I. (U Nottingham, England) **A comparison of interviews and observation to obtain measures of children's exposure to risk as pedestrians.** *Ergonomics*, 1974(Sep), Vol 17(5), 623-638.—144 5-11 yr old children were discreetly followed home from school by female Os who recorded their behavior at each road crossing on concealed tape recorders. The day after being followed each S was interviewed about his or her activities the previous day. Comparison was made between the Ss' reported exposure to traffic and findings of previous studies and between the Ss' reports and observation of their journeys. The comparisons indicate that Ss slightly underreported their actual exposure but confirm earlier findings that there is a highly significant increase in exposure with age but no difference in exposure between males and females over the age range studied. (French & German summaries)—*Journal abstract*.

10642. Schuster, D. H. (Iowa State U) **The effectiveness of official action taken against problem drivers: A five-year follow-up.** *Journal of Safety Research*, 1974(Dec), Vol 6(4), 171-176.—Evaluated the effectiveness of official action such as suspension or probation taken against problem drivers. Official action was manipulated randomly up or down 1 level from the normal course of action selected at the end of a 1-hr driver improvement interview. Drivers given less-than-normal action at the interview, however, had significantly more driving accidents subsequently than did drivers with normal or more-than-normal action. A significant interaction with previous official action complicated this 2nd finding in that drivers with previous suspension, but less-than-normal action at the interview, had more accidents later than if given normal or more-than-normal interview action. It is concluded that official departmental action affects later driving accidents but has little effect on moving violations. Official action should be progressively more severe if a problem driver doesn't improve.—*Journal abstract*.

10643. Shanmugam, T. E. (U Madras, India) **Presidential address at the Conference on "Accident & Safety" conducted under the auspices of the Madras Psychology Society, on 9th October 1971.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 80-82.—Suggests that consideration be given to prevention of the injuries and deaths due to industrial and traffic accidents which can be expected to accompany technological modernization in India. Various psychological factors involved in proneness to accidents are discussed.

10644. Siegel, Arthur I. & Burkett, James R. (Applied Psychological Services, Wayne, PA) **Application of**

**structure-of-intellect and psycholinguistic concepts to reading comprehensibility measurement.** *US AFHRL Technical Report*, 1974(Sep), No 74-49, 153 p.—Attempted to clarify and define methods for increasing the capability of written training materials to transfer information to the reader. Approximately 130 recruit US Air Force men were tested, half of them on materials highly loaded with Structure-of-Intellect variables, and half on materials lightly weighted with the variables. Results support the potential of psycholinguistics and intellectual concepts for readability-comprehensibility measurement. Concepts are presented for automating the measurements described. (8 p ref)—*Journal abstract*.

10645. Smart, Reginald G. (Addiction Research Foundation, Toronto, Ontario, Canada) **Marihuana and driving risk among college students.** *Journal of Safety Research*, 1974(Dec), Vol 6(4), 155-158.—Surveyed 296 undergraduates about the frequency of driving, accident involvement, and driving charges after marihuana use. While 42% of the licensed drivers ( $n = 246$ ) had used marihuana, only 62% of those reported driving soon after that use. Few reported accidents or moving violations after marihuana use, especially in comparison to after alcohol use. The frequency of marihuana-driving occasions is only about 35% that of alcohol driving occasions, however. It is possible that if legalization resulted in increased exposure, marihuana would not be safer than alcohol for driving.—*Journal abstract*.

10646. Sternberg, Jack J.; Banks, James H.; Widener, Thomas A. & Jennings, John W. (US Army Research Inst for the Behavioral & Social Sciences, Arlington, VA) **Selected elements of a battalion integrated sensor system: Device and mix effectiveness.** *US Army Research Institute for the Behavioral & Social Sciences, Research Report*, 1974(Jan), No 1183, 81 p.—Describes the 1st phase of a research program designed to develop an effective integrated sensor system for ground surveillance utilizing several combinations of radars, night vision devices, and sensors. The results obtained in a realistic operational setting with 3 US Army officers and 75 enlisted men show that (a) all devices used were effective for surveillance and target acquisition; (b) device performance effectiveness was also related to target type, terrain, and ambient conditions; and (c) the optimal mix was judged to be a 2-device mix—a medium-range night observation device plus ground surveillance radar. At the battalion level this mix performed best when used at 3 sites simultaneously.—*Journal abstract*.

10647. Stewart, T. F. (U of Technology, Loughborough, England) **Ergonomic aspects of man-computer problem solving.** *Applied Ergonomics*, 1974(Dec), Vol 5(4), 209-212.—Interviewed industrial designers, engineers, and economists concerning hardware and software interface problems. Results show that interactive computer usage can be of considerable assistance to specialists, although there are difficulties in using the computer system to full advantage.

10648. Summala, Heikki & Näätänen, Risto. (U Helsinki, Inst of Psychology, Finland) **Perception of highway traffic signs and motivation.** *Journal of Safety Research*, 1974(Dec), Vol 6(4), 150-154.—9 20-33 yr old drivers were instructed to drive as safely as possible over

a highway route of 257 kilometers and to name all the traffic signs they saw along the route. Ss were able to report approximately 97% of the signs on the entire route and virtually all of the signs in the nonurban, nonintersection areas, while driving safely and committing no traffic violations. It is concluded that earlier experimental results pointing to the relative inefficiency of highway traffic signs are probably primarily due to the deficient motivation of drivers to use them.—*Journal abstract.*

10649. Thillainayagam, R. (Highway Research Station, Madras, India) **Roadway elements: Their relation to road safety.** *Journal of Psychological Researches*, 1972(May), Vol 16(2), 83-88.—Illustrates how factors affecting the perception, expectation, decision, and action of the driver may pertain to the occurrence of traffic accidents. A number of road characteristics, such as traffic volume, median width, horizontal alignment, and type of intersection, are described in relation to accident rate.

10650. Tonge, D. G. (Glamorgan Polytechnic, Treforest, Wales) **Logical properties of the perceived behavi-**

**our patterns of a dynamical system.** *International Journal of Man-Machine Studies*, 1974(Nov), Vol 6(6), 715-728.—In studies of machine perception and learning and in the simulation of the adaptive control aspects of human behavior, one of the basic problems is that of obtaining suitable representations of the environment. The signal sources in the external world are essentially continuous in time and space, while their internal representations are generally discontinuous, being both sampled and quantized. It is noted that the relationship between the continuous world of physics and the perceived world of discrete objects is not a simple one psychologically, and an investigation of this relationship is important both to human and artificial intelligence theory. In the present article, a mathematical framework is detailed in which basic invariance requirements on the trajectories of a dynamical system in a quantized state space are analyzed to obtain relationships between the dynamical and logical properties of the system. A method for generating internal representations is presented.—*Journal abstract.*

# BRIEF SUBJECT INDEX

Entries in the Brief Subject Index are derived from a 4,000-term *Thesaurus of Psychological Terms*. Only those terms representing subject matter content covered in this monthly issue are listed. A thesaurus term missing from the listing indicates that no material of major relevance to the concept is included in the issue. Records are indexed at the level of specificity contained in each document. Each index entry also refers the reader to broader generic concepts as well as to more specific concepts related to each term. Thus, a reader interested in articles concerning childhood psychosis may find additional relevant information under "psychosis" or "early infantile autism."

 Age Differences 8580, 8708, 8795, 8892, 8933, 9151, 9237, 9249, 9251, 9268, 9274, 9276, 9283, 9284, 9286, 9291, 9324, 9328, 9329, 9343, 9348, 9350, 9394, 9402, 9413, 9451, 9501, 9518, 9780, 9881, 10022, 10157, 10631  
 Aged 9297, 9316, 9317, 9318, 9321, 9323, 9326, 9329, 9330, 9965, 9987, 10022, 10166, 10306, 10359, 10363  
 Agencies (Group) [See Organizations]  
 Aggressive Behavior [See Also Animal Aggressive Behavior, Attack Behavior, Conflict, Riots, Violence, War] 8844, 9401, 9512, 9540, 9554, 9654, 9842, 9845, 9851, 9870, 10003, 10518  
 Aggressiveness 9578  
 Aging (Physiological) [See Physiological Aging]  
 Agitated Depression [See Depression (Emotion)]  
 Agnosia 9793, 9939  
 Agonistic Behavior [See Aggressive Behavior]  
 Agricultural Extension Workers 9416, 9449  
 Agricultural Workers [See Also Migrant Farm Workers] 9367  
 Air Encephalography [See Pneumoencephalography]  
 Air Force Personnel 9086, 10597  
 Akinesia [See Apraxia]  
 Alcohol Drinking Attitudes 9427, 10595  
 Alcohol Drinking Patterns 9380, 9383, 9390, 9393, 9403, 9408, 9427, 9450, 9451, 9511, 9834, 10206  
 Alcohol Intoxication 9096, 9118, 10131, 10638  
 Alcoholic Beverages 9069, 9593  
 Alcoholic Hallucinoses [See Delirium Tremens]  
 Alcoholic Psychosis [See Also Delirium Tremens] 9753  
 Alcoholism 9096, 9223, 9753, 9831, 9832, 9834, 9837, 9841, 9846, 9847, 9856, 9864, 9877, 9881, 10099, 10101, 10103, 10119, 10120, 10128, 10131, 10143, 10148, 10151, 10160, 10192, 10194, 10206, 10349, 10595

# BRIEF SUBJECT INDEX

- Alcohols** [See Also Ethanol, Isoproterenol, Propranolol, Tetrahydrocannabinol] 9054, 9069, 9070, 9077, 9078, 9860
- Alexia** [See Aphasia]
- Algebra** [See Mathematics Education]
- Algorithms** 8574, 8702
- Alienation** 9312, 9359, 9366, 10605
- Alkaloids** [See Apomorphine, Atropine, Cocaine, Codeine, Mescaline, Morphine, Nicotine, Physostigmine, Reserpine, Scopolamine, Strychnine]
- Alpha Rhythm** 8783, 8832, 8888
- Alphabets** [See Letters (Alphabet)]
- Alzheimer's Disease** 9948
- Ambiguity (Stimulus)** [See Stimulus Ambiguity]
- Ambiguity (Tolerance)** [See Tolerance For Ambiguity]
- Ambition** [See Aspirations]
- Ambivalence** 9388, 9601
- Amenorrhea** 9959
- Amentia** [See Mental Retardation]
- American Indians** 9338, 9343, 9345, 9631, 9977
- Amine Oxidase Inhibitors** [See Also Lysergic Acid Diethylamide] 9100
- Amine Oxidases** [See Monoamine Oxidases]
- Amines** [See Also Amphetamine, Atropine, Catecholamines, Chlordiazepoxide, Chlorpromazine, Cocaine, Dextroamphetamine, Dopamine, Epinephrine, Imipramine, Methamphetamine, Methylphenidate, Norepinephrine, Physostigmine, Scopolamine, Serotonin, Tryptamine] 9746
- Amino Acids** [See Glycine, Tryptophan]
- Amnesia** 8831, 8962, 8974, 9007, 9087, 9100, 9121, 9732, 9982, 9999, 10304
- Amphetamine** 8983, 9037, 9040, 9084, 9088, 9089, 9091, 9122, 9180, 9390
- Amphetamine (D-)** [See Dextroamphetamine]
- Amphetamine (DI-)** [See Amphetamine]
- Amphetamine Sulfate** [See Amphetamine]
- Amphibia** [See Frogs]
- Amputation** [See Also Mastectomy] 10188
- Amputees** 10348
- Amygdaloid Body** 8861, 8862, 8985, 9005, 9010, 9020, 9021, 9050
- Analeptic Drugs** [See Strychnine]
- Analgesic Drugs** [See Also Atropine, Codeine, Methadone, Morphine, Novocaine, Scopolamine] 9077, 9114, 10142
- Analysis of Covariance** 8625
- Analysis of Variance** 8570, 8603, 8614, 8615, 8616, 8620, 8625, 8626, 8632
- Analysts** [See Psychoanalysts]
- Analytical Psychotherapy** 10009, 10040, 10048
- Anatomy** [See Also Related Terms] 8860, 9933
- Ancestors** [See Parents]
- Androgens** [See Also Testosterone] 8961, 8964, 9120
- Anesthesia (Feeling)** 8909
- Anesthetic Drugs** [See Also Cocaine, Ether (Anesthetic), General Anesthetics, Hexobarbital, Lidocaine, Local Anesthetics, Novocaine, Pentobarbital] 9077
- Anger** [See Also Hostility] 8846, 9481, 9515
- Angst** [See Anxiety]
- Animal Aggressive Behavior** [See Also Attack Behavior] 8927, 8935, 8937, 8976, 8981, 8999, 9011, 9023, 9065, 9119, 9130, 9190, 9191, 9195, 9199, 9204, 9205, 9212, 9213
- Animal Behavior** [See Animal Ethology]
- Animal Biological Rhythms** [See Animal Circadian Rhythms]
- Animal Breeding** 8936, 8937, 8939, 8940, 8941, 9121, 9132, 9210, 9211
- Animal Circadian Rhythms** 8569, 8897, 9042, 9049, 9134, 9215, 9226, 9230
- Animal Communication** 8921, 8987, 9190, 9203, 9280
- Animal Courtship Behavior** [See Animal Courtship Displays]
- Animal Courtship Displays** 8966
- Animal Dominance** 9192, 9198, 9206, 9207, 9209
- Animal Drinking Behavior** 8897, 8948, 8971, 9134, 9138, 9168, 9223, 9226
- Animal Environments** 8856, 8902, 8950, 8974, 9046, 9065, 9115, 9132, 9135, 9178, 9194, 9204, 9208, 9230
- Animal Escape Behavior** 9157
- Animal Ethology** [See Also Animal Aggressive Behavior, Animal Circadian Rhythms, Animal Communication, Animal Courtship Displays, Animal Dominance, Animal Drinking Behavior, Animal Escape Behavior, Animal Exploratory Behavior, Animal Feeding Behavior, Animal Instinctive Behavior, Animal Maternal Behavior, Animal Mating Behavior, Animal Open Field Behavior, Animal Sex Differences, Animal Sexual Receptivity, Animal Social Behavior, Animal Vocalizations, Attack Behavior, Imprinting, Nest Building, Territoriality] 9031, 9127, 9129, 9134, 9137
- Animal Exploratory Behavior** 8856, 8908, 9084, 9115, 9165
- Animal Feeding Behavior** 8897, 8961, 9008, 9009, 9013, 9102, 9128, 9130, 9134, 9205, 9206, 9226
- Animal Instinctive Behavior** 9034, 9134
- Animal Maternal Behavior** 8938, 8949, 8981, 9015, 9193, 9196, 9200
- Animal Mating Behavior** [See Also Animal Sexual Receptivity] 8904, 8907, 8929, 8940, 8943, 8953, 8960, 8961, 9000, 9051, 9093, 9098, 9116, 9120, 9124, 9194, 9197, 9220, 9225
- Animal Motivation** 8957, 9020, 9046, 9140, 9144, 9145, 9154, 9180, 9184
- Animal Open Field Behavior** 8979, 8992, 9075, 9141, 9178
- Animal Sex Differences** 8964, 9065, 9115, 9120, 9141, 9189
- Animal Sexual Receptivity** 8921, 8929, 8943, 8947, 8953, 8968, 8975, 9022
- Animal Social Behavior** [See Also Animal Aggressive Behavior, Animal Communication, Animal Courtship Displays, Animal Dominance, Animal Maternal Behavior, Animal Mating Behavior, Animal Sexual Receptivity, Attack Behavior] 9045, 9115, 9119, 9134, 9191, 9195, 9199, 9203, 9206, 9207, 9208, 9209, 9210, 9211, 9213, 9215
- Animal Strain Differences** [See Animal Breeding, Genetics]
- Animal Vocalizations** 9219, 9280
- Animals** [See Also Related Terms] 8533, 9007, 9236
- Annual Report** 8578
- Anodynes** [See Analgesic Drugs]
- Anomie** [See Alienation]
- Anorexia Nervosa** 9759, 10159
- ANOVA (Statistics)** [See Analysis of Variance]
- Anoxia** 8942, 9921
- Antagonism** [See Hostility]
- Anthropology** 9592, 10054
- Antibiotics** [See Also Cycloheximide, Penicillins] 9053, 9112, 10111
- Anticholinergic Drugs** [See Cholinergic Blocking Drugs]
- Anticholinesterase Drugs** [See Cholinesterase Inhibitors]
- Anticoagulant Drugs** 10148
- Anticonvulsant Drugs** [See Also Diphenylhydantoin, Pentobarbital, Phenobarbital] 10106, 10125
- Antidepressant Drugs** [See Also Imipramine, Lithium Carbonate, Methylphenidate, Tranylcypromine] 9067, 9072, 9103, 9107, 10087, 10092, 10113, 10124, 10150
- Antiemetic Drugs** [See Chlorpromazine, Promethazine]
- Antiepileptic Drugs** [See Diphenylhydantoin]
- Antihistaminic Drugs** [See Also Promethazine] 9077
- Antihypertensive Drugs** [See Chlorpromazine, Methylidopa, Reserpine]
- Antiparkinsonian Drugs** [See Antitremor Drugs]
- Antipsychotic Drugs** [See Also Chlorpromazine, Reserpine, Tetrabenazine] 10086, 10106
- Antischizophrenic Drugs** [See Chlorpromazine]
- Antisemitism** 8546
- Antisocial Behavior** [See Also Battered Child Syndrome, Child Abuse, Crime, Homicide, Juvenile Delinquency, Recidivism, Shoplifting, Theft] 9433, 9481, 9556, 9874, 9879, 9881, 10262, 10559
- Antisocial Personality** 9838
- Antispasmodic Drugs** [See Atropine]
- Antitremor Drugs** 9048, 9075
- Ants** 9203
- Anxiety** [See Also Anxiety Neurosis] 8543, 8910, 9467, 9515, 9615, 9641, 9646, 9776, 9796, 9813, 9832, 9850, 9956, 9973, 9990, 10024, 10025, 10098, 10154, 10205, 10207, 10209, 10463
- Anxiety Neurosis** 9613, 9802
- Anxiety Reducing Drugs** [See Tranquilizing Drugs]
- Anxiousness** [See Anxiety]
- Apache Indians** [See American Indians]
- Apathy** 9481
- Apes** [See Primates (Nonhuman)]
- Aphasia** 9955, 9963, 9976
- Apomorphine** 9034, 9116, 9117
- Apomorphine Hydrochloride** [See Apomorphine]
- Apparatus** [See Also Cage Apparatus, Computers, Electrodes, Shuttle Boxes, Tape Recorders] 8526, 8534, 8549, 8550, 8552, 8563, 8567, 8569, 8571, 8573, 8574, 8867, 8875, 8889, 8930, 9148, 10457, 10646
- Apparent Movement** 8681, 8686, 8717, 8727, 8740
- Apparent Size** 8542, 8689, 8690, 8719
- Appetite** [See Hunger]
- Appetite Depressing Drugs** [See Amphetamine, Dextroamphetamine]

**Appetite Disorders** [See Anorexia Nervosa, Hyperphagia, Obesity]  
**Applied Psychology** [See Clinical Psychology, Community Psychology, Counseling Psychology, Educational Psychology, Industrial Psychology, Medical Psychology, School Psychology, Social Psychology]  
**Apprehension** [See Anxiety]  
**Approval (Social)** [See Social Approval]  
**Apraxia** 9926, 10335  
**Aptitude** [See Ability]  
**Aptitude (Academic)** [See Academic Aptitude]  
**Aptitude Measures** 8602, 9380, 10567  
**Arapaho Indians** [See American Indians]  
**Architecture** 10413  
**Arithmetic** [See Mathematics Education]  
**Arm (Anatomy)** 8653  
**Army Personnel** 10576, 10583, 10646  
**Arousal (Physiological)** [See Physiological Arousal]  
**Arousal (Sexual)** [See Psychosexual Behavior]  
**Art** [See Also Drawing] 9889  
**Art Education** 10058  
**Art Therapy** 10007, 10014, 10027, 10034, 10043, 10058, 10066, 10069, 10076, 10338, 10511  
**Arthritis** [See Rheumatoid Arthritis]  
**Arthropoda** [See Ants, Cockroaches, Crabs, Drosophila, Moths]  
**Articulation (Speech)** 8660, 8671, 8673  
**Articulation Disorders** [See Stuttering]  
**Arts** [See Architecture, Art, Dance, Drawing, Literature, Music, Poetry]  
**Artwork** [See Art]  
**Ashkenazim** [See Judaism]  
**Asia** 9338, 9366  
**Asphyxia** [See Anoxia]  
**Aspirations** [See Also Educational Aspirations] 9391, 9429, 10489  
**Assertiveness** 8775, 10167  
**Assessment** [See Measurement]  
**Assistance (Social Behavior)** 9472, 9527  
**Association Learning (Paired)** [See Paired Associate Learning]  
**Associations (Groups)** [See Organizations]  
**Associations (Word)** [See Word Associations]  
**Associative Processes** 8847, 8858, 9142, 9182, 10217, 10223  
**Asthma** 9979, 10133, 10208  
**Asylums** [See Psychiatric Hospitals]  
**Ataractic Drugs** [See Tranquilizing Drugs]  
**Ataraxic Drugs** [See Tranquilizing Drugs]  
**Athletes** 8760, 9513  
**Atmospheric Conditions** 9137  
**Atropine** 9122, 9125  
**Attack Behavior** 8533  
**Attainment (Achievement)** [See Achievement]  
**Attempted Suicide** 9735, 9835, 9836, 9876, 10035, 10214, 10252  
**Attendance (School)** [See School Attendance]  
**Attendants (Institutions)** 10353  
**Attention** [See Also Divided Attention, Monitoring, Selective Attention, Vigilance] 8685, 8800, 8809, 8816, 8827, 8829, 8896, 9083, 9113, 9256, 9786, 9910, 9949, 10164, 10189, 10499, 10636

**Attitude Change** 9428, 9473, 9487, 9517, 9535, 9549, 9553, 9555, 9705, 10020, 10245, 10451, 10540  
**Attitude Formation** 9510, 9547, 10612  
**Attitude Measurement** 8606, 9358, 9447, 9551  
**Attitude Measures** [See Wilson Patterson Conservatism Scale]  
**Attitude Similarity** 9461, 9478, 9497, 9521, 9525  
**Attitudes** [See Also Related Terms] 9356, 9373, 9387, 9429, 9501, 9534, 9549, 9551, 9701, 10038, 10278, 10372, 10375, 10436  
**Attraction (Interpersonal)** [See Interpersonal Attraction]  
**Attribution** 8799, 8842, 9500, 9505, 9507, 9509, 9533, 9626  
**Audiences** 9535  
**Audiology** 8670  
**Audiometry** 8573, 8659, 8672, 8675, 9918  
**Audiotapes** 10442  
**Audiovisual Aids (Educational)** [See Educational Audiovisual Aids]  
**Audiovisual Communications Media** [See Also Audiotapes, Closed Circuit Television, Educational Audiovisual Aids, Educational Television, Film Strips, Motion Pictures, Photographs, Television, Videotapes] 10467  
**Audiovisual Instruction** [See Videotape Instruction]  
**Audition** [See Auditory Perception]  
**Auditory Discrimination** [See Also Loudness Discrimination, Pitch Discrimination] 8665, 8680, 9227, 9261, 9887, 10482  
**Auditory Evoked Potentials** 8526, 8880, 8881, 8884, 8886, 8990, 9006, 9216  
**Auditory Localization** 8571, 8659, 8677, 8822  
**Auditory Masking** 8662, 8664, 8668  
**Auditory Measurement** [See Audiometry]  
**Auditory Perception** [See Also Auditory Discrimination, Auditory Localization, Loudness Discrimination, Loudness Perception, Pitch Discrimination, Pitch Perception, Speech Perception] 8568, 8637, 8663, 8666, 8667, 8669, 8910, 8987, 9235, 9261, 9918  
**Auditory Stimulation** [See Also Loudness, Pitch (Frequency), White Noise] 8573, 8637, 8664, 8666, 8669, 8670, 8677, 8693, 8777, 8782, 8793, 8809, 8823, 8879, 8881, 8887, 8901, 9085, 9142, 9148, 9155, 9221, 9227, 9283, 9470, 9634, 9974, 10530, 10578  
**Auditory Thresholds** 8664, 8665, 8672, 8675, 8679, 9219, 9231, 9742, 9951, 10300  
**Aurally Handicapped** [See Also Deaf, Partially Hearing Impaired] 8679, 9951, 10300  
**Australia** 9265, 9278, 9301, 9347, 9365, 10527  
**Austria** 9410  
**Authoritarianism** 8546, 9332, 9365, 9644, 9698  
**Authority** 9652  
**Autistic Children** 9746, 9763, 9788, 10184  
**Autoeroticism** [See Masturbation]  
**Automated Information Coding** 8867  
**Automated Information Processing** [See Also Automated Information Coding, Automated Information Retrieval, Automated Information Storage] 8875, 10597, 10615  
**Automated Information Retrieval** 8774, 10504

**Automated Information Storage** 10421  
**Automobile Accidents** [See Motor Traffic Accidents]  
**Automobile Safety** [See Highway Safety]  
**Autonomic Nervous System** 9025, 9031, 9032, 9352  
**Autonomic Disorders** [See Also Downs Syndrome] 9940  
**Aversion Therapy** 10173, 10181, 10202  
**Aversive Stimulation** 8672, 9006  
**Avoidance** 8936, 9127  
**Avoidance Conditioning** 8890, 8946, 8955, 8964, 8972, 8974, 8993, 9010, 9017, 9024, 9029, 9048, 9049, 9061, 9076, 9087, 9088, 9151, 9155, 9162, 9163, 9164, 9169, 9170, 9179  
**Awakeness** [See Also Attention, Divided Attention, Monitoring, Selective Attention, Vigilance] 8785  
**Axons** 8859

**Babies** [See Infants]  
**Baboons** 9128  
**Background (Family)** [See Family Background]  
**Bacterial Disorders** 10338  
**Balance** [See Equilibrium]  
**Ballet** [See Dance]  
**Barbiturates** [See Also Hexobarbital, Pentobarbital, Phenobarbital, Secobarbital] 9057, 9089  
**Bargaining** 9463, 10599, 10616  
**Barometric Pressure** [See Atmospheric Conditions]  
**Barrett Lennard Relationship Invent** 9306  
**Basal Ganglia** [See Also Amygdaloid Body, Caudate Nucleus] 8872  
**Basal Readers** [See Reading Materials]  
**Battered Child Syndrome** 9875  
**Bayes Theorem** [See Statistical Probability]  
**Behavior Change** 10072  
**Behavior Disorders** [See Also Alcoholism, Antisocial Behavior, Attempted Suicide, Battered Child Syndrome, Child Abuse, Crime, Deception, Drug Abuse, Drug Addiction, Heroin Addiction, Homicide, Juvenile Delinquency, Recidivism, Shoplifting, Suicide, Theft, Truancy] 9808, 9843, 9916, 10109, 10388, 10464, 10519  
**Behavior Modification** [See Also Aversion Therapy, Behavior Therapy, Classroom Behavior Modification, Contingency Management, Implosive Therapy, Systematic Desensitization Therapy, Token Economy Programs] 8770, 8775, 8776, 8786, 9693, 9713, 10138, 10156, 10159, 10166, 10174, 10176, 10182, 10184, 10188, 10190, 10191, 10194, 10196, 10199, 10200, 10201, 10203, 10206, 10509, 10515, 10520, 10529, 10603  
**Behavior Problems** 9943, 9968, 10164, 10259, 10264, 10564

**Interpersonal Interaction** [See Also Assistance (Social Behavior), Bargaining, Charitable Behavior, Collective Behavior, Conflict, Conversation, Cooperation, Eye Contact, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Compatibility, Interpersonal Influences, Interviewing, Interviews, Job Applicant Interviews, Negotiation, Participation, Peer Relations, Psychodiagnostic Interview, Riots, Social Dating, Violence, War] 8564, 9344, 9460, 9462, 9469, 9471, 9475, 9480, 9485, 9488, 9494, 9496, 9540, 9546, 9597, 9707, 9806, 9967, 10171, 10345, 10353, 10464, 10607  
**Interpersonal Perception** [See Social Perception]  
**Interpretation (Psychoanalytic)** [See Psychoanalytic Interpretation]  
**Interracial Interval** 8754, 8824  
**Intertrial Interval** 8817, 8827, 9170, 9176  
**Interval Reinforcement** [See Fixed Interval Reinforcement]  
**Interviewing** 9466, 9522, 9569, 9698  
**Interviews** [See Also Job Applicant Interviews, Psychodiagnostic Interview] 9685, 10234  
**Intoxication** [See Toxic Disorders]  
**Intoxication (Alcohol)** [See Alcohol Intoxication]  
**Intrauterine Devices** 9815  
**Intravenous Injections** 8950  
**Intrinsic Motivation** 8834, 8835, 9505  
**Introversion** 10231  
**Intuition** 8781  
**Inventories** [See Also Biographical Inventories, Interest Inventories] 9389, 9415  
**Inventories (Personality)** [See Personality Measures]  
**Invertebrates** [See Ants, Cockroaches, Crabs, Drosophila, Mollusca, Moths, Octopus, Snails]  
**Investigation** [See Experimentation]  
**Involvement** 8648  
**Ions** [See Electrolytes]  
**Irradiation** [See Radiation]  
**Isolation (Social)** [See Social Isolation]  
**Isoproterenol** 9102  
**Israel** 9296, 9779, 9911  
**Italy** 9658  
**Item Analysis (Statistical)** 8628  
**Item Analysis (Test)** 8586, 8593, 8597, 8606, 9389, 9602, 9604

# BRIEF SUBJECT INDEX

Item Content (Test) 8594, 10560

Jails [See Prisons]

Japan 9340, 9466

Jealousy 9353, 9651

Jews [See Judaism]

Job Analysis 9719, 10391, 10583

Job Applicant Interviews 10594

Job Descriptions [See Job Analysis]

Job Experience Level 10615, 10620

Job Performance [See Also Employee Productivity] 9086, 9677, 10316, 10392, 10520, 10595, 10601, 10603, 10606, 10610

Job Performance Evaluation [See Job Performance, Personnel Evaluation]

Job Requirements [See Job Analysis]

Job Satisfaction 10414, 10580, 10595, 10599, 10600, 10602, 10604, 10606

Job Selection [See Occupational Choice]

Jobs [See Occupations]

Joint Disorders [See Rheumatoid Arthritis]

Jokes 8848, 9605

Joy [See Happiness]

Judaism 9326, 9911

Judo 10067

Jung (Carl) 9618, 9628, 9820

Jungian Psychology 9608, 9612, 9617, 9624, 9655, 10027, 10040

Junior Colleges [See Colleges]

Junior High School Students 10415, 10460, 10463, 10564

Jury [See Adjudication]

Justice 9443

Juvenile Court [See Adjudication]

Juvenile Delinquency 9454, 9852, 9855, 9858

Juvenile Delinquents [See Also Male Delinquents] 9809, 9839, 9853, 10044, 10319

Karyotype Disorders [See Chromosome Disorders]

Kidney Transplants [See Organ Transplantation]

Kidneys 10290

Kindergarten Students 10474, 10497, 10549

Kindergartens 10443

Knowledge of Results 8759, 8830, 9291, 9492, 10440, 10601

L Dopa [See Levodopa]

Labor (Childbirth) 8895, 9984

Labor Management Relations 10143, 10599, 10608, 10630

Labor Relations [See Labor Management Relations]

Labor Unions 10630

Laboratories (Experimental) [See Experimental Laboratories]

Laborers (Construct And Indust) [See Blue Collar Workers]

Laborers (Farm) [See Agricultural Workers]

Labyrinth (Anatomy) [See Cochlea]

Lactation 8981, 9196

Lag (Response) [See Reaction Time]

Language [See Also Bilingualism, Consonants, Conversation, Dialect, Foreign Languages, Form Classes (Language), Grammar, Handwriting, Language Development, Letters (Alphabet), Linguistics, Morphemes, Morphology (Language), Numbers (Numerals), Orthography, Phonetics, Phonology, Psycholinguistics, Public Speaking, Semantics, Sentence Structure, Sentences, Sight Vocabulary, Sign Language, Syllables, Syntax, Vocabulary, Vowels, Words (Phonetic Units), Written Language] 9582, 9583, 9631, 9901, 9933, 10225

Language Arts Education [See Also Phonics, Reading Education, Spelling] 10454

Language Development 9266, 9271, 9592, 9814, 9898, 9972, 10187, 10315, 10445, 10512

Laryngeal Disorders 10312

Latency (Response) [See Response Latency]

Lateral Dominance 8674, 8688, 8695, 8756, 8811, 8957, 9250, 9926

Law (Government) [See Also Criminal Law] 10361

Law Enforcement Personnel [See Police Personnel, Prison Personnel, Probation Officers]

Laws [See Also Drug Laws, Marihuana Legalization] 9445, 10182

Lead Poisoning 9962

Leadership [See Also Leadership Style] 9356, 10392, 10592, 10609, 10613

Leadership Style 9489, 10031, 10414, 10606, 10617

Learning Ability 9106

Learning Disabilities [See Also Dyslexia] 9733, 9886, 9891, 9901, 9910, 9933, 9949, 10088, 10406, 10481, 10503, 10507, 10511, 10518, 10531

Learning Disorders [See Also Dyslexia, Learning Disabilities, Reading Disabilities] 10443, 10481, 10552

Learning Rate 8782, 8800, 10518

Learning Schedules [See Distributed Practice]

Learning Theory 8529, 8566, 9811, 10158, 10182

Learning [See Also Related Terms] 8797, 8802

Legal Processes [See Also Adjudication, Commitment (Psychiatric), Incarceration, Legislative Processes] 9399, 9423, 9436, 9695, 10298, 10342, 10373, 10616, 10642

Legalization (Marihuana) [See Marihuana Legalization]

Legislative Processes 9445

Leisure Time 9318, 9457, 10232, 10376

Lemurs 9134

Lesbianism 9432, 9638, 10050

Lesions [See Also Brain Lesions, Hypothalamus Lesions, Neural Lesions] 8534, 8987, 8999

Letters (Alphabet) 8646, 8711, 9288, 9974, 10424, 10449

Leukemias 9978, 9983

Levodopa 9029, 9062, 9075, 9116, 10104

Libraries (School) [See School Libraries]

Librium [See Chlordiazepoxide]

Lidocaine 9119

Life Experiences 9324, 9810, 9961, 10364, 10572

Life Style [See Personality Processes]

Light [See Illumination]

Limbic System [See Also Amygdaloid Body, Hippocampus, Olfactory Bulb] 9005

Linguistics [See Also Consonants, Form Classes (Language), Grammar, Letters (Alphabet), Morphemes, Morphology (Language), Orthography, Phonetics, Phonology, Psycholinguistics, Semantics, Sentence Structure, Sentences, Syllables, Syntax, Vowels, Words (Phonetic Units)] 8528, 9556, 9933, 10555

Lipid Metabolism 9004

Lipids [See Also Fatty Acids] 9105

Listening [See Auditory Perception]

Listening Comprehension 8664, 10533, 10561

Literature [See Also Poetry] 9559, 9561, 9563, 9564, 9565, 9566, 9575, 9586, 9589, 9991

Literature Review 8872, 9077, 9129, 9200, 9205, 9248, 9275, 9304, 9383, 9400, 9483, 9595, 9769, 9774, 9844, 9863, 9910, 9932, 9933, 9995, 10070, 10112, 10181, 10267, 10287, 10483

Lithium 9028, 9060, 9115, 10127, 10147

Lithium Carbonate 9791, 10121, 10146

Liver 9609

Lizards 8879

Local Anesthetics [See Also Cocaine, Lidocaine, Novocaine] 9085

Localization (Sound) [See Auditory Localization]

Locus of Control [See Internal External Locus of Control]

Logical Thinking 8530, 8779, 8796, 8805, 9254, 9277

Long Term Memory 8903, 9255, 9328, 9330, 9778

Longevity [See Aged, Physiological Aging]

Longitudinal Studies 8532, 9370, 9878

Loudness 8664, 8667, 8678, 8679

Loudness Discrimination 8676

Loudness Perception [See Also Loudness Discrimination] 8676, 8678, 9951

Loudness Threshold [See Auditory Thresholds]

Love 9565

Lower Class 10062, 10328

LSD (Drug) [See Lysergic Acid Diethylamide]

Luminescence [See Illumination]

Luminance Threshold [See Brightness Perception, Visual Thresholds]

Lying [See Deception]

Lysergic Acid Diethylamide 9035, 9104, 9380

Magical Thinking 9812

Major Tranquilizers [See Neuroleptic Drugs]

Maladjustment (Emotional) [See Emotional Adjustment]

Maladjustment (Social) [See Social Adjustment]

Male Animals 8929, 8975, 9000, 9051, 9116, 9220

Male Castration 8954, 8961, 9051

Male Delinquents 9850, 9851, 9866, 9868, 9869, 9870, 9873, 9880, 10169, 10328

Male Genitalia [See Also Testes] 9940

Male Homosexuality 8894, 8900

Male Orgasm [See Also Premature Ejaculation] 8904, 8907

Males (Human) [See Human Males]

Mammals [See Also Baboons, Cats, Dogs, Dolphins, Foxes, Gerbils, Guinea

# BRIEF SUBJECT INDEX

Pigs, Hamsters, Lemurs, Marsupials, Mice, Monkeys, Primates (Nonhuman), Rabbits, Rats, Rodents, Sheep, Wolves] 8571, 9013, 9098, 9130  
**Mamillary Bodies (Hypothalamic)** [See Hypothalamus]  
**Man Machine Systems Design** 10632, 10640, 10647, 10650  
**Management Decision Making** 10226  
**Management Methods** 10226, 10603, 10608, 10610, 10611, 10614, 10617, 10630  
**Management Personnel** [See Also Middle Level Managers] 10285, 10313, 10343, 10602, 10610, 10613, 10614  
**Management Planning** 10226, 10612  
**Management Training** 10611  
**Management** [See Also Related Terms] 10605  
**Mania** [See Also Pica] 9791, 10111, 10130  
**Manic Depressive Psychosis** 9028, 9737, 9757, 9767  
**Manpower** [See Personnel]  
**Marathon Group Therapy** 10183  
**Marihuana** 9039  
**Marihuana Laws** [See Marihuana Legalization]  
**Marihuana Legalization** 9647  
**Marihuana Usage** 9039, 9372, 9380, 9390, 9403, 9406, 9647, 9853, 10645  
**Marijuana** [See Marihuana]  
**Marital Adjustment** [See Marital Relations]  
**Marital Problems** [See Marital Relations]  
**Marital Relations** 9313, 9459, 10180, 10249  
**Marital Separation** [See Also Divorce] 10242  
**Marital Status** 9324, 9875  
**Marketing** 9579, 9595  
**Markov Chains** 8710  
**Marriage** [See Also Exogamous Marriage] 9320, 9331, 10254  
**Marriage Counseling** 10002, 10185, 10242, 10245  
**Marriage Therapy** [See Marriage Counseling]  
**Married Couples** [See Spouses]  
**Marsupials** 8892  
**Masking** [See Auditory Masking, Visual Masking]  
**Masochism** 9785  
**Mass Media** [See Also Closed Circuit Television, Educational Television, Television] 9356, 9438, 9439, 9443, 9562, 9577, 9584, 9588  
**Mastectomy** 10287  
**Masturbation** 9369, 10211  
**Maternal Behavior (Animal)** [See Animal Maternal Behavior]  
**Maternal Behavior (Human)** [See Mother Child Relations]  
**Maternal Deprivation** [See Animal Maternal Behavior, Mother Child Relations]  
**Mates (Humans)** [See Spouses]  
**Mathematical Ability** 9282  
**Mathematical Modeling** 8608, 8612, 8630, 8850, 9139, 9192, 9568, 9579, 10380, 10575, 10584, 10650  
**Mathematics (Concepts)** [See Also Algorithms, Number Systems, Numbers (Numerals)] 8609, 8803  
**Mathematics Achievement** 9342, 10432, 10571

**Mathematics Education** 10394, 10431, 10435, 10471, 10523  
**Mating Behavior (Animal)** [See Animal Mating Behavior]  
**Matriculation** [See School Enrollment]  
**Maturation** [See Human Development]  
**Maturity (Emotional)** [See Emotional Maturity]  
**Maturity (Physical)** [See Physical Maturity]  
**Maze Learning** 8989  
**Mean** 8570, 8603  
**Meaning** [See Also Verbal Meaning, Word Meaning] 8866  
**Measurement** [See Also Related Terms] 8526, 8583, 8930  
**Media (Communications)** [See Communications Media]  
**Media (Educational)** [See Instructional Media]  
**Media (Mass)** [See Mass Media]  
**Mediation (Cognitive)** [See Cognitive Mediation]  
**Medical Diagnosis** [See Also Electroencephalography, Electromyography, Electroretinography, Galvanic Skin Response, Plethysmography, Pneumoencephalography] 9954  
**Medical Education** [See Also Psychiatric Training] 9664, 9667, 9673, 9679, 9687, 9690, 9691, 9699, 9703, 9705, 9706, 9721, 9989  
**Medical History** [See Patient History]  
**Medical Patients** 9925, 9927, 9950, 9964, 9965, 10114, 10124, 10267, 10287, 10294, 10297, 10299, 10303, 10305  
**Medical Personnel** [See Also Attendants (Institutions), Nurses, Paramedical Personnel, Physicians, Psychiatric Nurses, Psychiatrists] 9407, 9681, 9686, 9983, 10103, 10345, 10347, 10360, 10372, 10606  
**Medical Psychology** 9687  
**Medical Residency** 9709  
**Medical Sciences** [See Also Child Psychiatry, Community Psychiatry, Epidemiology, Forensic Psychiatry, Geriatrics, Immunology, Neurology, Neuropsychiatry, Obstetrics Gynecology, Psychiatry, Psychopathology, Social Psychiatry, Transcultural Psychiatry] 9718, 10092  
**Medical Students** 9679, 9682, 9690, 9703, 9705, 9706, 9709  
**Medical Therapeutic Devices** [See Contact Lenses, Hearing Aids, Optical Aids]  
**Medical Treatment (General)** 10001, 10541, 10572  
**Medication** [See Drug Therapy]  
**Medicine (Science of)** [See Medical Sciences]  
**Meditation** 8917, 9990, 10013  
**Melancholia** [See Depression (Emotion)]  
**Melatonin** 9123  
**Melleril** [See Thioridazine]  
**Membranes** [See Nictitating Membrane]  
**Memory** [See Also Long Term Memory, Memory Trace, Short Term Memory, Spontaneous Recovery (Learning)] 8643, 8789, 8805, 8807, 8811, 8814, 8817, 8819, 8821, 8822, 8825, 8831, 8857, 8962, 8963, 9112, 9118, 9159, 10217, 10437, 10535  
**Memory Disorders** [See Also Amnesia] 9974, 9999  
**Memory Trace** 8810, 8831, 9274  
**Menarche** 8803  
**Menopause** 9690, 10097

**Menstrual Cycle** [See Also Menarche, Menstruation, Ovulation] 8919, 8923, 8928, 9835  
**Menstrual Disorders** [See Also Amenorrhea] 9935  
**Menstruation** [See Also Menarche] 9201, 9353  
**Mental Age** 9884, 9892, 9912  
**Mental Deficiency** [See Mental Retardation]  
**Mental Disorders** [See Also Related Terms] 8605, 9399, 9436, 9733, 9738, 9739, 9761, 9769, 9771, 9774, 9784, 9808, 9822, 9934, 9991, 10000, 10055, 10212, 10265, 10267, 10363, 10365, 10367, 10553

**Mental Health Programs** [See Also Crisis Intervention Services, Hot Line Services, Suicide Prevention Centers] 10251, 10257, 10260, 10263, 10283, 10285, 10286, 10543, 10545, 10551, 10553, 10556, 10573, 10574  
**Mental Health Training (Community)** [See Community Mental Health Training]  
**Mental Hospitals** [See Psychiatric Hospitals]  
**Mental Illness** [See Mental Disorders]  
**Mental Retardation** [See Also Downs Syndrome] 9680, 9683, 9896, 9984  
**Mental Retardation (Attitude Toward)** 9680, 9893, 9894, 9899, 9903, 9911  
**Mentally Retarded** [See Also Educable Mentally Retarded, Idiot Savants, Institutionalized Mentally Retarded, Profoundly Mentally Retarded, Severely Mentally Retarded, Trainable Mentally Retarded] 9803, 9885, 9890, 9893, 9894, 9897, 9899, 9900, 9902, 9903, 9906, 9911, 9916, 10200, 10234, 10270, 10371, 10502, 10505, 10508, 10509, 10510, 10512, 10515, 10516, 10527  
**Mercury Poisoning** 9950  
**Mescaline** 9084  
**Mesencephalon** 8945, 8990, 9006  
**Mesoridazine** 10090  
**Metabolism** [See Also Catabolism, Lipid Metabolism] 8760, 8950, 8963, 9746, 9882, 9883, 9905  
**Metabolism Disorders** [See Phenylketonuria]  
**Metal Poisoning** [See Lead Poisoning, Mercury Poisoning]  
**Metallic Elements** [See Lithium, Potassium Ions]  
**Methadone** 9034, 9114, 9377, 9859, 10094, 10117, 10118, 10142, 10236  
**Methadone Maintenance** [See Drug Rehabilitation, Methadone]  
**Methamphetamine** 9045  
**Methaqualone** 9090, 9390  
**Methedrine** [See Methamphetamine]

# BRIEF SUBJECT INDEX

- Methodology [See Also Related Terms] 633, 10228
- Methylatropine [See Atropine]
- Methylidopa 10078
- Methylmorphine [See Codeine]
- Methylphenidate 10095
- Tetrazole [See Pentylentetrazol]
- Mexican Americans 9341, 9619, 10030, 0246, 10396, 10480, 10539, 10557
- Mezco 9658, 10082
- Mice 8534, 8901, 8908, 8927, 8935, 8936, 937, 8938, 8939, 8950, 9881, 9015, 9023, 028, 9036, 9057, 9068, 9071, 9084, 9087, 097, 9100, 9104, 9110, 9112, 9121, 9157, 159, 9174, 9194, 9197, 9221
- Micturition [See Urination]
- Middle Aged 9316, 9328, 10180
- Middle Class 9322, 9368, 9874, 9893, 0321
- Middle Level Managers 10607
- Migrant Farm Workers 10586
- Migration (Human) [See Human Migration]
- Mildly Mentally Retarded [See Educable Mentally Retarded]
- Milieu Therapy [See Therapeutic Community]
- Militancy 9487
- Military Officers [See Commissioned Officers]
- Military Personnel [See Also Air Force Personnel, Army Personnel, Commissioned Officers, Enlisted Military Personnel, Navy Personnel] 8905, 9393, 9845, 9852, 10458, 10592
- Military Recruitment 10584, 10597
- Military Training 10596
- Military Veterans 9929, 10145, 10241, 10339, 10345
- Minimal Brain Disorders 9936
- Minimally Brain Damaged 9949
- Minn Multiphasic Personality Invent 8590, 8593, 9638, 9798, 9831, 9931, 9959, 9960
- Minor Tranquilizers [See Also Chlordiazepoxide] 9079, 10097
- Minority Groups 8585, 9425
- Misbehavior [See Behavior Problems]
- Misconduct [See Behavior Problems]
- Misdemeanors [See Crime]
